ROUTLEDGE REVIVALS

Medieval England

An Encyclopedia

Edited by

Paul E. Szarmach, M. Teresa Tavormina and
Joel T. Rosenthal

Medieval England

First published in 1998, this reference work offers concise, expert answers to questions on all aspects of life and culture in Medieval England, including art, architecture, law, literature, kings, women, music, commerce, technology, warfare and religion.

This wide-ranging text encompasses English social, cultural, and political life from the Anglo-Saxon invasions in the fifth century to the turn of the sixteenth century, as well as its ties to the Celtic world of Wales, Scotland and Ireland, the French and Anglo-Norman world of the Continent and the Viking and Scandinavian world of the North Sea. A range of topics are discussed from Sedulius to Skelton, from Wulfstan of York to Reginald Pecock, from Pictish art to Gothic sculpture and from the Vikings to the Black Death. A subject and name index makes it easy to locate information and bibliographies direct users to essential primary and secondary sources as well as key scholarship.

With more than 700 entries by over 300 international scholars, this work provides a detailed portrait of the English Middle Ages and will be of great value to students and scholars studying Medieval history in England and Europe, as well as non-specialist readers.

Introduction

Medieval England: An Encyclopedia is an introduction to the society and culture of England from the coming of the Anglo-Saxons in the 5th century through the accession of the Tudor dynasty (1485) and the turn of the 16th century. Its 708 entries were written by an international team of over 300 scholars from the British Isles, North America, continental Europe, Australia, New Zealand, Jordan, and Japan.

The editors have conceived of the entries as covering the fields of Old English and Middle English Language and Literature, Music and Liturgy, Art History, and History. Though the articles vary from a sentence or two to several columns, both the general reader or student and the professional scholar can turn to them—for their content and summary value as well as for their bibliographical guides to further work and reading on any given topic. In addition, by means of the *See also* annotations at the end of the entries and the general index at the end of the volume, interested readers can follow a given topic in much greater depth than is apparent from the separate entries. Thus the interdisciplinary and complementary nature of the material included in the articles, written by scholars in many disciplines and collected by the various field editors, becomes apparent and available for further exploration. The bibliographies guide the reader to the basic primary and secondary materials on a given topic and to some of the more recent scholarship. Where possible their content has been selected with an eye to accessibility for nonspecialist readers, though not to the exclusion of more advanced but essential work. Thus a higher (but not absolute) priority has been given to scholarship in English, books and journals likely to be available in university libraries, and general studies, especially those that provide good bibliographic and methodological guidance for further research. Commonly cited scholarly journals are represented by their standard abbreviations (listed in the Abbreviations section that follows).

The primary selection criterion for entry topics has been a strong relationship between the topic and the events, persons, culture, or languages of non-Celtic Great Britain. Thus most of the history and culture of Scotland and Wales has been excluded. Latin and French authors are included only when, in the editors' opinion, they have a connection to England by birth, travel, or

influence (e.g., Abbo of Fleury, John of Salisbury, Marie de France, Jean Froissart). Musical, liturgical, artistic, architectural, and intellectual traditions—all of which have strong continental associations—are examined mainly as they manifested themselves in England.

A volume of this sort is the product of many hands and many schools of interpretation and scholarly expertise. The history and culture of England are too rich and complex to be summarized, even in a large reference volume, in a fashion that is both comprehensive and satisfactory to all contributors or all readers. Even to talk of “English” history and culture serves to remind us that the very words of inclusion and definition are, simultaneously, those of exclusion. While England has center stage, we are also reminded of the dense and tangled threads that tied it to the Celtic world of Wales, Scotland, and Ireland, to the French and Anglo-Norman world of the Continent, to the Viking and Scandinavian world of the North Sea, and to the general culture of medieval Christendom, which embraced theology, scientific thought, and major trends and styles in intellectual and cultural expression, all with little regard for political and geographic boundaries. Previous Garland encyclopedias on medieval Scandinavia and medieval France touched heavily on the many ties between their basic subjects and British and English history. Similarly many of the entries in this volume indicate the cultural influences that link England to the rest of Europe.

Innumerable articles in the pages that follow emphasize the peculiar tension that marks the society, political life, and culture of medieval England. In some ways England was peculiar as a result of the insularity and parochialism that seem appropriate for a kingdom located on a small island, set on the northwesterly edge of the medieval world, far from the centers of Paris, Rome, and the Mediterranean. On the other hand English history and culture are explicable only when seen as the multihued end-product of a lively and often troublesome process of diffusion, whereby a two-way exchange with the Continent—pertaining to political as well as to cultural and intellectual developments—shaped its growth. English history and life offer distinct variations on the general themes of medieval European history. The lending and borrowing of ideas, institutions, cathedral architecture, musical forms, styles of handwriting and armor, or bawdy stories in the vernacular are but a few of the topics we can trace to contacts with neighbors (be they friends or foes) who were found in any and every direction.

How to Use This Book

In British universities to this day the historiographical tradition regarding the period covered by the volume differs from the standard North American usage. In Britain the period is often divided into the Anglo-Saxon or Old English period and, after the Norman Conquest of 1066, the “medieval” period as such. In this volume we apply the term “medieval” to both the Anglo-Saxon and post-Conquest periods, though the watershed of 1066—with new institutions of government, a new relationship to France and Normandy, and a new ruling class speaking a different language—is clearly visible between and within many entries. As a reference volume, this encyclopedia does not argue consistently through its pages for any particular interpretation regarding such dilemmas as the legal or social consequences of the Norman Conquest, the vitality of vernacular literature in the 12th and 13th centuries, or the popularity of the late-medieval church, although these are certainly topics that could well interest some users of the book. Instead the editors have given contributors to the volume the freedom to cover their topics as they choose and to decide, individually and freely, how much and what direction of “spin” to give their entries. Whether King John and Richard III were good or bad kings, or good or bad men, are questions that engage both authors and students. The debates will go on for many years, and we hope that the articles included here summarize current discussions that are pertinent to their subjects, while steering readers to the means whereby they can further pursue their concerns. All entries contain elements of interpretation and intellectual partisanship, and even those that seem merely expository or narrative in presentation are necessarily and properly shaped by authorial experience, judgment, and choice.

Wherever possible we have tried to combine related entries of manageable lengths into joint articles under a single headword so that chronological or some other reasonable order could be preserved in reading about the topic. In some cases it has been possible to commission articles on related subtopics or chronological units by the same author; in other instances related articles by two authors have been combined by the editors (occasionally by the authors themselves) into joint entries. Joint entries are identified by a double byline, in which the order of the names reflects the order of the entry’s separate parts. A very few entries were co-written by two authors or conflated from the work of two authors, and these are indicated by an “*” in the Contributors list. Some related entries have been left as separate articles, either because the contributors’ approaches were different enough to make combination an uneasy proposition or because keeping the entries separate would make them and their references more manageable for readers. The List of Contributors identifies the entries written by each contributor.

Entries are arranged alphabetically, with the Old English character *æ* (*ash*)

being treated as equivalent to *ae*, the Middle English character ȝ (*yogh*) coming after *g*, and the Old and Middle English characters Ð (*eth*) and (thorn) treated as equivalent to *th*. Alphabetical arrangement—essential if users are to find cross-referenced articles without difficulty—means that in a number of instances chronologically related entries appear out of chronological order: “Art, Gothic” before “Art, Romanesque” and “Women in Middle English Literature” before “Women in Old English Literature,” for example. Users of the book are urged to read such related entries together so as to observe the broad historical developments within the topics in question.

Medieval literary works are listed under their authors’ names, where those names are known. Many medieval works are anonymous, and these have been alphabetized under their titles, normalized where possible into a modern English form (titles of Middle Scots works are left in Middle Scots, however, and titles whose sense would be significantly changed by modernization have also been left in their medieval form—e.g., *The Kingis Quair*, *Mum and the Sothsegger*, *Handlyng Synne*). Names are given in forms that the editors have judged to be readily recognizable to general readers as well as familiar to scholars. In most cases this recognizability has been achieved by following Library of Congress author and subject headings (the most notable exception being our “Becket, Thomas” instead of Thomas à Becket) and by using surnames or perceived surnames when those have achieved common usage (e.g., Bacon, Duns Scotus, Grosseteste), most commonly with figures from the 13th century or later. Individuals known primarily by their personal names followed by geographical or other cognomens (Julian of Norwich, Edmund of Abington, Charles of Orléans, Sedulius Scottus, Edward the Black Prince, etc.) are listed under their personal names.

Acknowledgments

Medieval England: An Encyclopedia is a project that began in 1987 when Gary Kuris approached Paul E. Szarmach about Garland’s plans for a series of encyclopedias organized around the nations and cultural areas of medieval Europe. Within two years the editorial team took shape, editors contacted contributors, and the encyclopedia became, administratively, a project of the Center for Medieval and Early Renaissance Studies at SUNY-Binghamton through the Research Foundation of SUNY. As is to be expected in a project some ten years in duration, Time’s fell hand had its effect. Elizabeth Parker McLachlan was unable to develop her editorial plans for Art History because

of illness, and Catherine E. Karkov agreed to succeed her as editor for this field, bringing her own directions to this major area. Throughout the project Peter M. Lefferts has maintained his key and steady role as editor for entries on Music and Liturgy. When Szarmach, who was initially both general editor and Old English field editor, moved from Binghamton to Western Michigan, progress began to slow; as a result M. Teresa Tavormina and Joel T. Rosenthal moved from service as editors for Middle English and History into roles as general editors for the later stages. Tavormina has focused on reviewing the Old English, Middle English, and Music and Liturgy fields as well as the final editing of the text itself; Rosenthal, on reviewing the History and Art History fields, coordinating illustrative material for the volume, and supervising the production phase of the project.

Many other persons and institutions have assisted with the development of the individual fields. The University of Chicago and the University of Nebraska provided assistance with the costs of photocopying and postage for the Music and Liturgy field, as have SUNY-Binghamton and Western Michigan University for Old English, SUNY-Stony Brook for History, Michigan State University for Middle English, and Miami University and Rutgers University for Art. Charlotte Newman Goldy, Timothy C. Graham, Walter Leedy, F. Donald Logan, Timothy J. McGee, Lister M. Matheson, Perette Michelli, David A.E. Pelteret, E.G. Stanley, Michael W. Twomey, and Emily Zack Tabuteau were cheerful and reliable when new or extra work was asked of them, sometimes under very short deadlines.

The History field editor is pleased to acknowledge the help of Teresa Fetzter, who helped reconstruct some texts that a Stony Brook machine devoured. Ralph A. Griffiths and Caroline Barron offered much invaluable advice when some vital entries seemed destined for the orphanage. Alan Stahl went to special pains to help with the illustrative material on coins, and George Beech, Ralph V. Turner, and Sue Sheridan Walker read proofs for colleagues no longer able to do so. Marguerite Halversen helped catch bibliographic inconsistencies at an early stage, when there was still time to learn to do things better. In Art History the generous provision of illustrative materials by George H. Brown, Sarah Brown, Carol A. Farr, Malcolm Thurlby, Walter Leedy, Elizabeth Parker, Kelley Wickham-Crowley, Thomas-Photos, and especially Jane Hawkes and Lawrence Hoey is much appreciated. Many institutions, publishers, and individuals have kindly granted permission for reproduction of pictorial materials, and those permissions are recorded in detail in the captions to the illustrations.

For Middle English a large debt is owed to A.S.G. Edwards for his review of the initial versions of entries in the field. The Department of English at Michigan State provided the Middle English editor with a term of research

leave early in the project, and crucial bibliographic and factual checking for the field was performed by research assistants Marguerite Halversen and Priscilla Walker and by the members of the medieval research methods seminar at Michigan State, Rebecca Arnould, Robert M. Kellerman, Sharon Kelly, Kayla Keyser, and Paul Mulligan. The advice of John A. Alford, Stephen A. Barney, Larry D. Benson, John Leyerle, E.G. Stanley, and many other colleagues over the duration of the project is gratefully acknowledged here. Special thanks are due Lister Matheson for countless editorial consultations both large and small, literary and historical, and for his much-appreciated tolerance of an enterprise that seemed destined at times to swallow up desks, floors, dining-room tables, and many other horizontal surfaces.

Contributors, whether early or late, timely or tardy, demonstrated the patience necessary for group projects, and the editors hope that the laborers of the first hour and those of the eleventh find this publication a blissful reward. The editors are also particularly grateful to Holly Holbrook, who did much of the initial inputting of entries while she pursued her graduate work in the early 1990s. The continuing support of Gary Kuris, in a real sense the *onlie begetter* of the work, made so much possible: he has been coach and cheerleader, and always a witty blend of Squire Allworthy and Thwackum. Chuck Bartelt and Marianne Lown of Garland have each given advice and support on countless occasions, and Dawn Martin has provided the project with both its index and a welcome final review of consistency and style. Humanists tend to be singles players, but *Medieval England: An Encyclopedia* has been team play from the beginning.

Entries, Arranged by Category

The following list contains all the entries of the *Encyclopedia*, arranged by category in order to give users a sense of the kinds of entries they can find in the pages below. A few items appear under more than one category, although the editors have sought to limit the number of such duplications to those entries that are genuinely difficult to assign to a single category.

Kings and Queens of England

The information below is taken mainly from E.B. Fryde, D.E. Greenway, S. Porter, and I. Roy, eds., *Handbook of British Chronology*; 3d ed. (London: Royal Historical Society, 1986). Dates given for kings are for date of birth (where known), and for accession to death. For Henry VI and Edward IV the dates further reflect the “readepth” of Henry VI in 1470–1471. Dates for queens are for date of birth (where known), marriage, and death (where known).

	<i>Birth</i>	<i>Reign</i>
Kings of Wessex		
Alfred (The Great)	849	871–899
Edward (The Elder)		899–924
Ælfweard		924–924
Anglo-Saxon and Danish Kings of England		
Æthelstan		924–939
Edmund I	921	939–946
Eadred		946–955
Eadwig	before 943	955–959
Edgar I	943	957–975 (north of Thames)
		959–975 (all England)
Edward I	ca. 962	975–978
Æthelred II (The Unready)	968/69?	978–1016 (dispossessed by Swein, 1013–1014)
Swein		1013–1014

Edmund II (Ironside)	before 993	1016–1016		
Cnut		1016–1035		
Harold I (Harefoot)	ca. 1016?	1035–1040		
Harthacnut	ca. 1018?	1035–1042		
Edward II (The Confessor)	1002/05	1042–1066		
Harold II (Godwinson)	ca. 1020	1066–1066

Edward III	1312	1327–1377	Philippa of Hainault	b. 1314, m. 1328, d. 1369
Richard II	1367	1377–1399	Anne of Bohemia	b. 1366, m. 1382, d. 1394
			Isabella of France	b. 1389, m. 1396, d. 1409
Lancastrian Dynasty				
Henry IV	1366	1399–1413	Mary Bohun	m 1380-81, d. 1394
			Joan of Navarre (& Brittany)	b. 1370, m. 1403, d. 1437
Henry V	1387	1413–1422	Catherine of Valois	b. 1401, m. 1420, d. 1437
Henry VI	1421	1422–1461	Margaret of Anjou	b. 1430, m. 1445, d. 1482
		1470–1471		
Yorkist Dynasty				
Edward IV	1442	1461–1470	Elizabeth Woodville	b. 1437, m. 1464, d. 1492
		1471–1483		
Edward V	1470	1483–1483	unmarried	
Richard III	1452	1483–1485	Anne Neville	m. 1472, d. 1485
Tudor Dynasty				
Henry VII	1457	1485–1509	Elizabeth of York (daughter of Edward IV)	b. 1466, m. 1486, d. 1503

Archbishops of Canterbury and York

The information below is taken mainly from E.B. Fryde, D.E. Greenway, S. Porter, and I. Roy, eds., *Handbook of British Chronology*, 3d ed. (London: Royal Historical Society, 1986). Various archbishops who were nominated but never enthroned or (in the Anglo-Saxon period) who are questionable have been omitted. In the earlier centuries some of the dates are less certain than for the later period.

<i>Canterbury</i>	<i>York</i>		
Augustine	597–604/9		
Laurence	604/9–619		
Mellitus	619–624	Paulinus	625–633

Musical and Liturgical Terms

Adiastematic

See Neume

Ars Nova

A “new art,” referring most narrowly to the Parisian innovations in musical notation of the first half of the 14th century, as they are so tagged in a group of treatises associated with Philippe de Vitry. More broadly, the term is used today for the music of the 14th century in contrast to that of the 13th, whose manner of notation had been correspondingly and retrospectively termed the “old art” (*ars vetus* or *ars antiqua*) by those medieval innovators.

Authentic

See Mode

Ballade

An important form of French poetry and music from the later 13th century through the 15th. It characteristically features three stanzas of poetry, each in the musical form AAB. The stanzaic structure of a ballade may consist of anywhere from seven to twelve lines. A typical eight-line stanza has the rhyme scheme ab ab be bC, where the first four lines are sung to musical elements AA, and the continuation of four lines is sung to B. A one-line textual refrain (C) concludes each stanza. A related form popular in English

song writing of the 15th century is the rhyme royal (or rime royal), whose typical seven-line stanza has the rhyme scheme ababbcc.

Bas

Bas instruments were soft instruments appropriate for playing indoors, while haut instruments were loud instruments appropriate for playing out of doors. Haut and bas minstrels specialized in playing such instruments.

Black Void (White Notation)

Modern term describing a notational innovation beginning with English sources of ca. 1400. In a rapidly increasing number of sources after that date musical scribes wrote the heads of notes as black outlines rather than as solid black figures; hence the notes look “void” or “white.”

Breve

By name a relatively short note, shorter than a long but longer than a semibreve; its shape was a square. The long represented a beat in the later 12th century, but the breve replaced it in that function over the course of the next hundred years. In the 14th century the semibreve came to represent a beat, and the breve filled the modern bar or measure.

Cadence

A melodic or harmonic gesture that conveys a sense of repose or conclusion at the end of a phrase, section, or full musical composition. Different musical genres, styles, and historical periods have their own characteristic ways of making cadences and of subverting or weakening a perceived drive to a cadence.

Canon

As a liturgical term “canon” refers to the Canon of the mass, an ancient sequence of prayers, beginning “Te igitur,” that is said silently by the priest as he prepares for the Communion. As a musical term “canon” may refer to a kind of imitation or to a written rule. In canonic imitation there is the exact duplication of a leading voice by a follower at a given time and pitch interval. In the sense of a rule a “canon” is a written instruction for deriving one or more unnotated voices from a notated part. It may simply explain how to generate the correct, complete melody from what has been notated incompletely or in the form of a puzzle, or it may call for one or more following voices to be generated from the given one.

Cantio

Nonliturgical, that is, secular or devotional, Latin art song, usually monophonic.

Cantus Firmus; Cantus Prius Factus

A previously existing melody that is taken as the structural basis above or around which to compose a new polyphonic composition; also called *vox principalis* or *tenor*.

Cauda

Musical term with two principal meanings. It may refer to an extended vocalization over the first or last syllable of a line of verse, stanza, or full text, as found in some 13th- and 14th-century monophonic and polyphonic conductus and motets. It may also refer to an upward or downward stem on a notehead or in a ligature. The *cauda hirundinis* (“swallow’s tail”) was an invention of the 14th-century English theorist Robertus Brunham that incorporated two such stems in the shape of an upright or inverted letter V.

Circle-Stem Complex

English mensural notation of the 14th century using upward and downward stems on the lozenge-shaped semibreve, dots of division to separate breve groups, and small circles to separate halves or thirds of a breve. It was used to represent a number of different time signatures and was the notation of choice for the music given to the right hand in the earliest known tablature notation for keyboard in the Roberts bridge Codex.

Clausula

Little snippet of polyphony from the late 12th or early 13th century, composed over a melisma from a musically elaborate mass chant. Its texture was mainly note-against-note counterpoint. It could be embedded in an organum or exist as an independent piece. The texting of the upper voice of the two-voice clausula gave rise to the motet.

Compass

The *ambitus*, that is, the total range of musical notes spanned by a voice part or piece.

Concordance

Another surviving source of a given word, text, or musical composition; the term is useful because it is more neutral with respect to relationships between multiply occurring appearances than words like “version,” “variant,” or “copy.”

Constructivist

Emphasizing formalism and rigorous techniques like proportional designs, canon, imitation, or voice exchange for generating musical textures and large-scale architecture.

Contrafact

An adaptation of a vocal composition in which a new text has been substituted for the original.

Copula

In 12th- and 13th-century organum a technical term for a passage linking the sections with sustained-tone *cantus firmus* to those with a metrically organized *cantus firmus*.

Counterpoint

Polyphony; the term derives from *punctus contra punctum*, note against note, and by extension, melody against melody.

Diastematic

See Neume

Diatonic

A collection of tones epitomized by the white-note scale of the keyboard; any music confined to these tones.

Diminution

The restatement of a single musical line or polyphonic fabric in shorter values (opposite: augmentation). Such diminution is usually proportional, that is, in a fixed ratio like 2:1 or 5:3; chains of proportional diminution and augmentation, such as the series 9:6:4 or 6:4:2:3, may govern the dimensions of large compositions. In respect to musical notation diminution is the capacity of a note to take value away from an adjacent or nearby larger value.

En Mitre

Referring to organ pipes organized by size into the shape of a bishop's miter, that is, like a pyramid or the capital letter "A."

Enchiriadis Treatises

Later 9th-century music theory treatises of Frankish origin.

Estampie

An instrumental dance melody or vocal dance song; the most common form consisted of a series of melodies, each stated twice, with first and second endings shared by all strains that acted as a unifying refrain.

Ferial

A liturgical term relating to weekdays when no feast occurs (opposite: festal).

Foremass

The entrance ceremonies and service of readings that constitute the first half of

the mass, to be contrasted with the sacrifice mass, the second half of the service, consisting of the offertory rites, eucharistic prayers, and communion cycle.

Gamut

In medieval music theory the lowest note of the scale, a contraction of gamma-ut. More generally the entire span of tones from bottom to top.

Guidonian Hand

In medieval music theory a diagram of the human hand with a note of the scale marked at each finger joint and tip. This was a teaching tool, named after Guido of Arezzo (fl. 1020s–1030s), that was used by the early 12th century to help memorize the scale and to aid in demonstrating the correct intervals for singers.

Haut

See Bas.

Hemiola

The flexible, dancelike grouping of six musical pulses into two beats of three pulses each or three beats of two pulses each.

Hexachord

In medieval music theory a scale segment of six notes, comprising a single fixed pattern of tones and semitones (T-T-S-T-T) and sung to the syllables Ut,

Re, Mi, Fa, Sol, La.

Hocket

Either a texture within a larger musical form or an independent composition, in which a musical line is shared between two voices in rapid alternation, so that each voice part involved in the exchange consists principally of single notes separated by rests.

Imitation

Or “melodic imitation,” a technique of polyphonic music involving successive, overlapping statements of a melodic contour by two or more voices.

Isorhythm

Modern term for a repeating scheme of time values in the tenor of a 14th- or 15th-century motet or mass movement. This may be restated in identical values (in the “unipartite” motet) or in proportionally diminished values, such as 2:1 or 9:6:4 (in the “bipartite” motet, “tripartite” motet, and so forth). Over the course of the 14th century the principle was extended to the other voices of the motet (“panisorhythm”).

Ligature

A neume encompassing several notes, all sung to the same syllable. In mensural notation a ligature may convey information about the rhythmic values of its notes, depending on its shape and the musical context.

Macaronic

Mixing two or more languages in a single text; in particular, mixing vernacular with Latin in the English carol.

Melisma

An extended vocalization consisting of a sequence of several pitches sung to one syllable.

Mensural

Referring to measured rhythm; in *musica mensurabilis* (measured music), whether monophonic or polyphonic, each note has a fixed durational value. Mensural notation was invented in the 13th century. Mensuration is a consistent set of temporal relationships between note values, like modern meters, and can be specified in modern language as an underlying, repetitive framework or hierarchy of pulses per beat and beats per bar.

Mensuration

See Mensural

Mode

In medieval music theory “mode” refers according to context either to the church modes or to the rhythmic modes. The medieval church modes can be epitomized as a series of eight scales, two for each of the four final pitches D, E, F, and G, one (authentic) extending above the final, the other (plagal) centered on the final. The rhythmic modes were stereotypical rhythmic patterns that

dominated the rhythmic language of composed church polyphony around 1200. They were notated with regularly recurring patterns of ligatures.

Monochord

A pedagogical device in medieval music theory for the demonstration of musical intervals and tunings, constructed of a single string stretched between two points with a movable bridge.

Monophony

Music composed of a single line or melody.

Morrow Mass

Not the principal mass of the day, but an additional mass celebrated just preceding the morning chapter meeting that was held some time after Prime in monasteries and collegiate churches.

Musica Mensurabilis

See Mensural

Mutation

A technical feature of medieval sightsinging when using the six solmization syllables (Ut, Re, Mi, etc.). If a melody spans more than six notes, two or more overlapping hexachords must be used to cover it. The shift from one hexachord to another is called mutation.

Neume

Any of the symbols used in the notation of plainchant. If neumes show relative pitch by vertical alignment on the page, they are heightened (intervallic, diastematic). If they do not show relative pitch, they are unheightened (adiastematic).

Offices

The sequence of liturgical services within each day, including the night hours of Vespers, Compline, Matins, and Lauds; the day hours of Prime, Terce, Sext, None; and the principal mass of the day, whose first half, the foremass, is essentially also an office. The main purposes of the offices are to recite the Psalter weekly and to read through the Bible once a year.

Ordinary

A liturgical term referring to those texts that are invariable from day to day in a given service, for example, the Ordinary of the mass. Its opposite is “Proper,” referring to those texts that are used only on one particular day.

Organista

A composer or singer of organum; or, an organ player.

Organum (pi. Organa)

General term encompassing the earliest types of polyphonic music from ca. 850 to 1250. By about 1200 “organum” also came to be used in a more specific sense to designate just that kind of two-voice polyphonic texture in which a freely projected voice unfolded above a succession of sustained tones (*organum duplum*, *organum purum*, *organum per se*); two or three voices

could also participate in more coordinated rhythmic and melodic counterpoint over the held tones (*organum triplum* *organum quadruplum*).

Ostinato

A persistently repeated rhythmic or melodic figure.

Partsong

Vocal polyphony consisting of two or more voice parts.

Pes

Literally “foot.” In English polyphony of the 13th and 14th centuries a motet voice of tenor function that was either freely composed or perhaps drawn from the realm of popular music, usually featuring chains of melodic couplets (AA BB CC DD etc.) or strict or varied *ostinati*. Sometimes a *cantus firmus* drawn from plainchant was also labeled a “pes” in an English source, and the repetitive two-voice accompaniment to the Sumer canon is identified as a pes.

Plagal

See Mode

Plainchant; Plainsong

The monophonic melodies of the Catholic liturgy; Gregorian chant of ca. 800 and its later medieval accretions.

Polyphony

Music composed of several simultaneously sounding lines.

Positive

A medium-sized, portable organ that was played with both hands while an assistant worked the bellows.

Precentor

A dignitary of the church ranking just below cantor; he was often the highest ranking practical musician, with authority over the choir and library.

Proper

See Ordinary

Prosa

A word carrying variable meanings, “prosa” most often identifies a musical-poetic addition to the Latin liturgy intended for performance in a location such as after the Alleluia or Gospel at mass, after the first or third Nocturne in the night office of Matins, or in processions. In some medieval manuscripts “prosa” refers to the text of a sequence or identifies what we now call a trope.

Prosula

Text added to preexisting melismatic music as a form of trope.

Rondeau

An important form of French poetry and music from the later 13th century through the 15th. It characteristically features a bipartite refrain (AB) whose music is reused for the verses in the pattern whole refrain, half verse, half refrain, whole verse, whole refrain. If lower case letters are used to represent verses set to refrain melody, then this form can be represented as ABaAabAB. Early rondeaux had two-line refrains, but in the 15th century refrains of three, four, or five lines became popular.

Score

A way of notating polyphonic music so that all the parts are arranged one above the other on separate staves and aligned so that events happening simultaneously are lined up vertically. Score notation was the standard means of notating all polyphony until the mid-13th century and remained in England the normal means of notation for all genres except the motet and its derivatives until well into the 15th century.

Semibreve

A lozenge-shaped note shorter than the breve and longer than the minim. It was used to represent the pulse in 13th-century mensural notation, and in the 14th century it was used to represent the beat.

Solfège; Solmization

A teaching tool attributed to Guido of Arezzo (fl. 1020s-1030s), by which singers learned to sing correctly the intervals of a melody using the six

syllables of the hexachord—Ut, Re, Mi, Fa, Sol, La—and the Guidonian hand.

Tenor

See Cantus Firmus

Tetrachord

In medieval music theory a scale segment of four notes, comprising three possible patterns of tones and semitones (T-S-T; S-T-T; T-T-S).

Unheightened

See Neume

Versicle

A short verse or sentence; a single line of poetry or prose. In the liturgy a simple formula in the form of a brief dialogue, consisting of a versicle and response, for example, a statement by a priest and a congregational reply. In musical settings of texts “versicle” can be less ambiguous than “verse” (which could mean “line,” “strophe,” or “poem”) in descriptions of how much text is set to a given phrase or melody. A double versicle is two lines of text, such as a poetic couplet, each set to the same melody, or by extension a repeated short melodic strain whether texted or not.

Vigiles; Vigilatores

Watchmen, usually also with musical abilities and employed as household or civic minstrels; waits.

Virelai

An important form of French poetry and music from the later 13th through the 15th centuries. It characteristically features a refrain (A) that frames three stanzas, each consisting of a couplet set to a repeating strain (bb) and a continuation with new text using the form and music of the refrain (a). Hence the overall musical form is A bba A bba A bba A.

Voice Exchange

A constructivist compositional device extensively used by English composers of the 13th and 14th centuries in conductus, motets, and chant settings of Alleluias. In one period of voice exchange two voices present melodies simultaneously over an accompaniment. Upon repetition of the accompaniment the counterpoint is exchanged between the two voices and restated. This technique is closely related to English rondellus and rota.

Abbo of Fleury (ca. 940/45–1004)

Born at Orléans, Abbo was oblate, student, master, and from 988 abbot of Fleury (St. Benoît-sur-Loire), in a period of excellence for that monastery. In 1004 he was killed at La Réole, in Gascony. Praised by contemporaries (e.g., Fulbert of Chartres), Abbo was venerated as a martyr during the Middle Ages; Aimoin wrote his biography (*PL* 139:387–414).

Abbo was trained in the schools of Fleury, Reims, and Paris, and his production stretches over such fields as astronomy and mathematics (e.g., a commentary on the *Calculus* of Victorius of Aquitaine). An active supporter of the Cluniac reform, he opposed the power of the bishops and had a stern adversary in Arnulf of Orléans; the *Apologeticus ad Hugonem et Rodbertum* reflects this aspect of his personality. Several of his letters survive (*PL* 139). Some of his works, such as the excerpts from the Fathers, are lost and some are still unprinted. Abbo wrote a treatise on papal authority (*Excerptum de gestis romanorum pontificum*), a *Collectio canonum* (*Collection of Canons*), and a work on the *Syllogismi dialectici* (a treatise on logic).

Abbo spent the years 985–87 at the recently established English abbey of Ramsey, where, at the invitation of Dunstan, he wrote the *Passio sancti Eadmundi* (the source of Ælfric's *Life of Edmund*). In the *Quaestiones grammaticales* Abbo answers questions of orthography, morphology, and syntax raised by his English students. One of them, Byrhtferth, acknowledges his indebtedness to Abbo (in the *Enchiridion*) and refers to his works in Oxford, St. John's College 17. An English abbot, Wulfric, asked Abbo to turn a work (perhaps the earliest *Life of Dunstan*) into verse. He wrote acrostics and elaborate poems addressed to Otto III and the pope, one on Ramsey, and three for Dunstan.

Adrian and Ritheus; Prose Solomon and Saturn

Two late OE lists of brief questions and answers, such as existed in other European languages, both earlier and later, with or without naming the interlocutors. These two lists, like some in medieval Latin, are formulaic in presentation (“Tell me ...; I tell you ...”) but miscellaneous in topic, although the majority of questions demand a literal knowledge of scripture (Who first prophesied? Samuel) or of writings explaining or amplifying scripture (How long did Adam remain in paradise? Thirteen years).

Sometimes the questions have a riddling quality: What man died but was not born and was buried in his mother’s womb? Adam, formed of earth (Gen. 2:7). Some items are about the physical world: the composition of the sun (burning stone), its size, where it is at night, why it is red in the evening and morning. Some are moralistic: What is best and worst? Man’s word. Although the purpose of these lists was to teach, and they have some association with lists in Latin manuscripts from missionary centers in Europe, they also offer much unusual information about medieval interest and knowledge.

Adso of Montier-en-Der (ca. 910/15–992)

Author of a highly influential 10th-century work on the Antichrist. Born of a noble family, oblate in the monastery of Luxeuil, teacher in the monastery of St. Èvre in Toul, Adso arrived at Montier-en-Der in 935, to become its abbot before 968. In 990 he was appointed abbot of St. Bénigne (Dijon); he died on a pilgrimage to the Holy Land in 992.

We know about Adso's life and works from different sources (e.g., *De diversis casibus Dervensis coenobii*). He had a good knowledge of classical literature and was a collector of rare books; a catalogue of his personal library survives. He wrote saints' lives (four of which are mentioned by his biographer) that yield proof of his commitment to the movement of spiritual renewal taking place in France. Adso's life of Frodobert has a verse preface, and two poems precede his life of Mansuetus; he was also asked by Abbo of Fleury to versify the second book of Gregory's *Dialogues*, but this and other poetic works of his do not survive.

Adso owes his renown to the *Epistola ad Gerbergam reginam de ortu et tempore Antichristi*, written between 949 and 954, at the command of Gerberga, queen of the Franks. This work exerted a significant influence on later descriptions of Doomsday and portrayals of Antichrist; it did not follow the *Revelations* of Pseudo-Methodius or the Tiburtine Sibyl, and its main sources were Bede and Haymo of Auxerre. It had immediate success and large diffusion (circulating under the names of Augustine, Alcuin, and others) and underwent several reworkings; several versions are printed by Verhelst. It was well known in England: one OE homily is the first vernacular version of

Adso's work, which was also the main source of a 12th-century Latin drama, the *Ludus de Antichristo*.

Ælfric (ca. 945–ca. 1015)

Abbot of Eynsham, sometimes called "Grammaticus" ("the grammarian"), the greatest writer of English prose before the Norman Conquest and the leading scholar of his day. His contributions to the literary and religious life of 10th-century England mirror the achievements of his more illustrious predecessors from the 8th and 9th centuries, Bede and King Alfred the Great. Like Bede, whom he often consulted as a source, Ælfric produced a substantial body of homiletic and hagiographic writings. But following the example of King Alfred, Ælfric broke away from Latin, the traditional language of the church, and wrote primarily in English in order to reach a wider audience.

There seems little reason to doubt Ælfric's largely unnoticed autobiographical statement in his *Grammar* that he studied under and was

ordained by Dunstan, a key figure in the Benedictine Reform who became archbishop of Canterbury in 960 and who is widely credited with restoring monastic life after its virtual demise by the middle of the 10th century (“If you were to say, ‘Who taught you?’ I would say ‘Dunstan.’ ‘Who ordained you?’ ‘He ordained me.’”). If this statement is true, Ælfric’s date of birth would almost certainly have to be placed some ten years earlier than the date of 955 given in virtually all other standard biographical references. No doubt surrounds Ælfric’s later studies with another leading figure of monastic reform, Æthelwold, at the Benedictine monastery at Winchester. In 987, three years after Æthelwold’s death, Ælfric obtained a position as monk and masspriest at Cernel Abbey in what is now Cerne Abbas, Dorset. Within a few years he had achieved a reputation as the preeminent literary figure of the Benedictine revival.

At Cernel Ælfric developed a remarkable and innovative “rhythmical prose” style, admirably suited for oral delivery, that resembles OE verse in its use of paired phrases linked by alliteration but differs from it in matters of tone, style, diction, and metrical constraints. Ælfric avoids, for example, the use of the kenning, *kend heiti*, *ókend heiti*, and other metaphoric statements commonly associated with OE heroic poetry and strives instead for “ordinary English speech” (*usitatam Anglicam sermocinationem*). Hickes praised Ælfric’s prose as *purus, suavis, et regularis* (“pure, smooth, and orderly”), and W.P. Ker hailed Ælfric as “the great master of prose in all its forms.” Yet his considerable skills as a prose stylist were undoubtedly of secondary importance to Ælfric, whose central and abiding literary concern (as John Pope has noted) was the instruction of the adult laity, most of whom knew no Latin, in the Christian faith.

Ælfric’s seven chief works—two volumes of *Catholic Homilies* or *Sermones catholici*, two additional sets of homilies based in part on his previous writings, *De temporibus anni*, the *Grammar*, and the *Lives of Saints*—form a reasonably complete educational program aimed at providing the spiritual instruction Ælfric deemed necessary for salvation. His literary canon builds upon the program of learning instituted by King Alfred a century earlier but differs from that program by virtue of its more tightly focused spiritual emphasis, its greater comprehensiveness, and its stricter accuracy in rendering Latin texts.

Ælfric reveals the impetus for his literary career by quoting in the preface to his first major work Christ’s great commission to his disciples “to instruct and teach all people the things that he himself had taught them” (Matt. 28:19–20); Ælfric apparently patterned his life and writings not only upon this injunction but also upon the more dire scriptural text he cites in the same breath, namely that the Lord’s servants must themselves face perdition if they fail to warn and exhort the unrighteous (Ezek. 33:8). This divine mandate lends to Ælfric’s

literary activities a spirit of personal mission and urgency, and this same spirit informs the inchoate program of instruction promulgated by King Alfred, which Ælfric both emulates and augments in his own writings. Ælfric borrows from King Alfred the revolutionary idea of using the vernacular to broaden the reach of instruction to “all people,” which in practice meant reaching out to the uneducated majority of his countrymen who knew no Latin.

Yet Ælfric—traditional, conservative, and orthodox by temperament—proved a somewhat reluctant revolutionary. He persistently worried about the appropriateness of making Latin texts generally available to the laity, who might, for example, misconstrue scripture and believe that they might have four wives just as the patriarch Jacob did. Ælfric vowed on several occasions that he would cease from translating lest the pearls of Christ fall into disrespect, yet at the end of his career he apparently accepted the usefulness of his writings and, far from retracting them, conveniently enumerated them and in effect canonized them in the *Letter to Sigeward*.

In addition to following Alfred’s lead in translating, Ælfric turned to other sources of inspiration, such as Augustine’s *De catechizandis rudibus* and *De doctrina christiana*, for more detailed guidance in establishing the range of texts and the survey of doctrine needed to fulfill the catechetical dimensions of Christ’s commission to his disciples. Evangelical doctrine, therefore, forms the cornerstone of Ælfric’s instructional mission, and, to that end, Ælfric composed his first major work, the *Catholic Homilies* (also known as the *Sermones catholici*), which appeared in two separate volumes, issued respectively in 989 and 992. Each set of the *Catholic Homilies* contains a series of 40 sermons arranged according to the calendar of the church year (beginning with Christmas and ending with the second Sunday in Advent) and designed for distribution among the priests of England as preaching texts for alternate years of the liturgical calendar. The texts provide instruction not only in such fundamental topics as the Creed, the Lord’s Prayer, the Ten Commandments, the plan for salvation, the story of Christ, and other matters appropriate to the catechumenate, but also in more theologically advanced matters involving patristic exegesis and allied forms of allegorical and typological interpretation of scriptural texts.

Viking attacks, political tumult, the approach of the year 1000, and the disastrous reign of King Æthelred II doubtless contributed to the millenarian concerns voiced in Ælfric’s preface to the first series of the *Catholic Homilies*. Yet his writings show less alarm for death at the hands of the Vikings or the coming end of the world (which, Ælfric points out, though soon, might still be distant by human measures of time) than for *gedwyld*, “error.” *Gedwyld* for Ælfric meant more particularly religious error, especially the kind spread in unorthodox, apocryphal, or misleading religious writings, such as the popular

Vision of St. Paul or works prohibited by the Gelasian Decretals, including narratives about the Virgin's birth or a certain *Passio sancti Georgii* that featured fantastic accounts of St. George's seven years of torture, the fragmentation of his body, and his several preliminary deaths and resuscitations.

The *Catholic Homilies* and later writings attempt to provide sound spiritual instruction, free from error and heresy, as weapons for the salvation of the English nation. Ælfric marshals the best patristic authorities available to him, and his corpus of writings offers an epitome of ecclesiastical thought as transmitted through the channels of Carolingian learning and the Benedictine Reform. His translations include the works of Augustine, Gregory the Great, Bede, Jerome, Smaragdus, Isidore, Ambrose, Leo the Great, Cassiodorus, Sulpicius Severus, a version of the *Vitae patrum*, Hilduin of St. Denis, Abbo of Fleury, Donatus, Priscian, a treatise on liturgy by Amalarius, and a host of other sources. Ælfric turns to his patristic authorities, particularly Augustine, Gregory, and Bede, for his exegetical homilies, which compose the great bulk of his *Catholic Homilies*, some 55 or so homilies out of 80, and he uses these and other sources for his other sermons, which include about seventeen saints' lives, expositions of the liturgy, and more thematically diverse works that encompass such general topics as creation and eschatological concerns.

Ælfric refers to the *Catholic Homilies* as a translation from Latin books, sometimes rendered literally but sometimes paraphrased to capture the sense rather than the wording of his source. Recent scholarship confirms Ælfric's enormous debt to the homiliary of Paul the Deacon, who edited and composed nearly 250 homilies at the request of Charlemagne for use throughout the Carolingian Empire. Yet those who closely scrutinize Ælfric's Latin sources now realize that he frequently consults other authorities, evaluates differences, selectively edits, conflates, and condenses to avoid tedium, amplifies to explicate an obscurity, and sometimes so deviates from his sources that his work approaches originality. As Pope has observed, the "thought is scrupulously traditional yet fully digested and feelingly his own" (1967: 150).

Nowhere is this more apparent than in Ælfric's famous *Sermon on the Sacrifice on Easter Day* (*Sermo de sacnficio in die Pascae*, item xv in *Catholic Homilies* II), the first and most controversial text ever printed in OE. Published in 1566 or 1567, Ælfric's sermon arguably marks the beginning of English studies, securing for the study of the English language an importance that had previously been accorded only to the classical languages. Printed by Archbishop Matthew Parker as ancient testimony of the continuity between the religious beliefs of the Protestant reformers and the Anglo-Saxons, particularly with regard to eucharistic teaching, Ælfric's sermon seemingly offered early evidence against the "bodely presence" of Christ in the eucharist

or, as later Protestant theologians argued, against the doctrine of transubstantiation.

Although Ælfric's Easter homily raises a number of doctrinal questions, the second set of *Catholic Homilies* does not typically differ from the first by showing a keener interest in these matters of theological controversy. Ælfric instead seems to shift emphasis away from exegesis toward narrative. The second set of *Catholic Homilies*, for example, contains far more narratives of saints' lives, the Bible is more often treated as a story rather than as a text for analysis, and the narrative form itself receives sharper dramatic emphasis through Ælfric's initial and sporadic experiments with rhythmical prose.

Ælfric sustains and strengthens these narrative and stylistic impulses in his third major set of original translations, his *Lives of Saints*, which also contains 40 sermons ordered according to the church calendar, now predominantly cast in rhythmical prose. The set recounts the lives and passions of those saints honored by monks in their Latin services, but Ælfric's English translations make these lives available to a wider, presumably lay audience, including his patron, Æthelweard, who commissioned the work. Ælfric treats Old Testament saints by translating and paraphrasing sections of the book of Kings and Maccabees; he traces the passions of Roman martyrs, such as Julian, Sebastian, and George; and he honors the English saints Alban, Æthelthryth, Swithun, Oswald, and Edmund.

Even if his numerous patristic and hagiographic translations had not survived, Ælfric's reputation would have been secured for posterity solely by the survival of his brilliant biblical translations. He translated or adapted sections of Genesis, Numbers, Joshua, Judges, Kings, Esther, Judith, and Maccabees; his articulate and graceful translations of the pericopes (scriptural readings) that precede many of the *Catholic Homilies* contrast with the more awkward and mundane renderings found in the nearly contemporary West Saxon Gospels. The same ease and clarity of expression also mark Ælfric's other writings, particularly his letters and even his scientific writings, such as the *De temporibus anni*, which deals with astronomy, measures of time, the computation of Easter, and atmospheric phenomena.

Apart from his religious writings directed largely toward the educational needs of the laity, Ælfric's educational program also provided basic instructional texts for the study of Latin, presumably for future clerics, though here too the importance of the vernacular makes itself felt: Ælfric's is the first Latin grammar written in English, and his short conversation piece for boys to practice their Latin, the *Colloquy*, survives in one manuscript with a continuous interlinear English gloss. In his *Grammar* Ælfric translates and simplifies the *Excerptiones de Prisciano* (an intermediate grammar) and augments it with excerpts from Isidore's *Etymologiae*, biblical quotations, and

a collection of paradigms in order to make grammar accessible to younger pupils.

In 1005 Ælfric was chosen to be the first abbot at Eynsham Monastery, about fifteen miles outside of Oxford. There he remembered his former teacher by composing a life of Æthelwold in Latin, and he also wrote a guide for his monks by abridging Æthelwold's *De consuetudine monachorum*. Other writings from this period include letters and homilies, such as *De creatore et creatura* and *De sex aetatibus mundi*, as well as reworkings of individual homilies and earlier collections of homilies. None of his works can be securely dated after about 1010, and he may have died between 1010 and 1020. The success of Ælfric's educational mission can be partially measured by the large number of surviving Anglo-Saxon manuscripts that preserve his writings; these manuscripts bear witness to the esteem of his contemporaries and to those scribes and scholars who continued to copy his writings for the next 150 years.

Ælfric Bata (fl. early 11th century)

Three colloquies or dialogues found in Oxford, St. Johns College 154, are assigned, by their respective rubrics, to Ælfric Bata. From their content it is

possible to infer that he was a monk and a disciple of Ælfric (possibly at Eynsham, after 1005). He taught in the school of an unidentified monastic center, perhaps at Canterbury, in the early 11th century. A certain Æ.B. is mentioned in the *Vita Dunstani* written by Osbern and in a colophon on fol. 117 of BL Cotton Tiberius A.iii.

Æ.B.'s colloquies belong to the tradition of scholastic colloquies (a teaching tool popular in the British Isles), which originally described the daily routine of a lay schoolboy. Their scheme was reworked to meet the needs of the oblates and their content reshaped to describe, albeit inconsistently, the everyday life of an English school. Though they apparently portray lively scenes of school life, these texts are actually stereotyped set pieces, full of the Graecisms and neologisms that characterize a share of Anglo-Latin literary production. Æ.B.'s third colloquy is an enlarged version of the *Colloquy* written by Ælfric: it shows several additions, stemming from Æ.B. He adds long lists of names of animals, trees, and so on drawn from Ælfric's *Glossary*, but his reworking spoils the grace and balance of the original. Another colloquy found in the Oxford manuscript might also be a work by Æ.B. The first three colloquies have occasional OE glosses, printed by Napier and Stevenson-Lindsay. The attribution of further works (e.g., the OE gloss on the *Regularis concordia*) to Æ.B. rests on no firm ground.

Æthelberht (d. 616/18)

King of Kent, he probably came to the throne in 589–93 and reigned for about 25 years. His fame rests on two acts: in 597 he accepted into his realm Augustine of Canterbury, Gregory the Great's missionary to the English, and thus permitted the reestablishment of the European church's direct links with England after these had largely been broken in the 5th century. And then, undoubtedly under the influence of Augustine and his associates, Æthelberht issued the first collection of Anglo-Saxon laws (inaccurately termed a "code"). This linked him with other Germanic rulers, who, in issuing collections of laws, placed themselves in the same tradition as the great imperial rulers of Rome, such as Theodosius and Justinian.

Unlike his continental counterparts Æthelberht issued his laws in the vernacular, not in Latin. The laws survive only in a 12th-century transcript, the so-called *Textus Roffensis*, and may have suffered omissions and amendments with the passage of time. As they stand, they lay down a scale of payments for injuries suffered by various classes of people in Kent, placing the king and the bishop at the head of the society by according them the highest level of compensation. This suggests that Æthelberht understood that an association with Christianity could enhance his own power. He was baptized and even received a letter from Pope Gregory, a copy of which Bede recorded in his *Ecclesiastical History*.

Æthelberht's power appears to have been considerable, made possible by his lengthy reign (though the regnal dates of 560 to 616 mentioned by Bede probably record his lifespan). Bede lists him as the third of the seven kings who exercised control over the kingdoms south of the Humber; his influence certainly seems to have extended to the East Saxons and East Anglia, and he came to be rivaled only by his later contemporary Rædwald of East Anglia (possibly the king associated with the Sutton Hoo ship burial).

Æthelberht's receptivity to Christianity and to the idea of issuing a collection of laws may have been encouraged by the links Kent seems to have had in the 6th century with the continental Frankish realms, evidenced by the style of archaeological artifacts that have been found in Kent. The Merovingian rulers of Gaul may even have claimed hegemony over Kent through the

marriage of Æthelberht with Bertha, daughter of Charibert, king of Paris. She brought her own bishop, Liudhard, with her to the Kentish capital of Canterbury, where an old church of apparently Roman foundation dedicated (or rededicated) to St. Martin of Tours was put back into use. Though Æthelberht's son, Eadbald, initially rejected Christianity, the religion suffered only a temporary setback, as he subsequently was converted. Canterbury remains to this day the seat of the (now Anglican) primate of all England.

Æthelflæd, Lady of the Mercians (d. 918)

Daughter of Alfred of Wessex and sister of his successor, Edward the Elder; one of the few medieval women who ruled a kingdom. Other women acted as regents for underage sons; Æthelflæd had no son, and from the death of her husband, Æthelræd, lord of the Mercians, in 911, until her own death she apparently controlled Mercia by herself. During these years she conducted the defense against Viking attacks, building fortifications in the northwest against incursions from the Irish Sea and in the northeast against English Viking settlements. She was responsible for campaigns that recovered Leicester and Derby from Viking rule, and her military power was such that the Danish settlers at York sought her as their “lord” and the Welsh kings submitted to her. Like a king she granted land by charter in her own name.

This extraordinary personal rule was a continuation of power she had possessed and exercised during her husband’s lifetime; after 900 her name was already associated with his in joint grants of land. Behind her active role lies the prominence of earlier Mercian queens, growing since the 8th century. These earlier women, however, provide no direct parallel, since the political situation of the late 9th and early 10th centuries was crucial to her larger role. Her marriage sealed an important alliance between Mercia and Wessex in the face of an acute and continuing Viking threat, an alliance more nearly one of equals than indicated in the extant West Saxon sources; Mercian sensitivities were respected. Æthelflæd’s situation was unique: the personification of the alliance, a partner with her brother, and heir to a Mercian tradition. On her death a section of the Mercian nobility attempted to make her daughter Ælfwyn their ruler, but Edward marched in and Wessex dominated the future of Mercia. The peculiar conjunction of tradition and circumstance that had elevated Æthelflæd was not heritable.

Æthelred II (968/69?–1016; r. 978–1016)

Became king after his stepbrother, Edward, was murdered. Æthelred, who was then no more than twelve, can hardly be held responsible for the regicide. Initially the administration of the country proceeded as before; only in the 990s do Æthelred’s land grants and the rise of new regional leaders suggest that he was gaining independence. But then an upsurge in Scandinavian incursion was met by a policy of buying off the attackers, a strategy that arguably may have worked for a time. Ten thousand pounds was paid out in 991 after a skirmish made memorable in the OE poem *The Battle of Maldon*, in which Ealdorman Byrhtnoth was killed.

Æthelred tried to take the initiative against the marauders, for instance, by attacking Strathclyde and the Isle of Man. On the other hand he seems to have instigated the St. Brices Day massacre of Danes on 13 November 1002, which may well have sparked retaliatory raids by Swein of Denmark. Scandinavian attacks of increasing frequency over the next decade were met by large disbursements of silver. Internal tensions were almost inevitable, especially since unitary kingship was a relatively recent phenomenon in England. Wulfnoth Cild, the South Saxon, rebelliously harried the south coast in 1009; in 1015 Thorkell the Tall, a Danish war chief, after supporting Æthelred for a time, swung his support to Cnut. The ealdorman of Mercia, Eadric Streona (“Grasper”), vilified in the sources for his treachery, tried to maintain his family interests in the Midlands by alternately supporting Æthelred and Cnut.

Æthelred tried to shore up his power by marrying Emma, daughter of Richard II, duke of Normandy, and by marrying three of his daughters to local leaders, but by 1012 the country was in disarray. After Christmas in 1013 the king fled to Normandy; only following the death of Swein, some six weeks later, did the Anglo-Saxon leadership permit him to return as king. He lived but two more years, and even those were marred by the rebellion of his son, Edmund Ironside.

The two greatest vernacular prose stylists of the Anglo-Saxon era, Ælfric of Eynsham and Wulfstan, archbishop of York, were his contemporaries. The writings of the savant Byrhtferth and some fine Anglo-Saxon illuminated

manuscripts were also products of his reign, as were the four great codices of OE poetry. The very size of the *heregeld*, the tax levied to pay the Scandinavian marauders, points to a wealthy and administratively well organized kingdom.

Paradoxically this high culture has fostered a negative assessment of the reign, largely through such works as Wulfstan's powerful sermon "To the English," outlining the evils of the day, and the Anglo-Saxon Chronicle, whose compiler had the benefit of hindsight. Post-Conquest sources sealed Æthelred's reputation, one of them giving him the punning nickname of *Unræd*, "Ill-Counsel," from which the modern English sobriquet of "Unready" derives. Only in recent years has a close examination of less emotive sources, such as his numerous charters and his coinage, permitted a more balanced appraisal of his reign.

Æthelstan (d. 939; r. 924–39)

King of Wessex, Mercia, and—by the time of his death—of all England. The son, probably illegitimate, of Edward the Elder, he was an early favorite of his father and his grandfather Alfred the Great. Raised at the court of Æthelræd of Mercia and his wife, Æthelstan's aunt Æthelflæd, he may have participated with his father and Æthelflæd in the military operations that laid the foundations for the extension of West Saxon authority throughout England.

Crowned on 4 September 925, following his father's death in 924, Æthelstan's reign was devoted to gaining the submission of the independent princes of the Scandinavian north and the Celts and Britons of the western regions. Combining force, threats of force, and diplomacy, his tactics proved successful. His imperialistic policy culminated in a great victory at Brunanburh in 937, over a coalition of the kings of Scotland and Strathclyde and the Norse claimant to the Northumbrian throne, Olaf Guthfrithsson. His charters asserted, with justification, that he was "king of the English and ruler of all Britain." This theme of unifying the English kingdoms and peoples was further reflected in his assemblies. By bringing local interests and leaders together he weakened the provincialism that had previously impeded efforts toward the consolidation of the English kingdoms.

Through marriage alliances Æthelstan established contacts with a number of princes on the Continent; five of his sisters married royal figures, including Charles the Simple, king of the West Franks, and Otto, son of Henry the Fowler of the East Franks and future emperor. On at least one occasion he sent English troops to France to support the cause of Louis d'Outremer, son of the murdered Charles the Simple, who had found sanctuary in England following his father's death. Æthelstan died 27 October 939 at Gloucester. Apparently unmarried and childless, he was succeeded by his brother Edmund.

Æthelweard (d. ca. 998)

Æthelweard was ealdorman of the western provinces; his charter signatures begin in 973 and end in 998, presumably not long before his death. In later years his signature heads the list as senior ealdorman. He was descended from Æthelred I, king of Wessex 865–71, and was thus a kinsman of Æthelred II (the Unready). His sister Ælfgifu was for a time the wife of King Eadwig. In common with his son Æthelmær, who founded monasteries at Cerne (987) and Eynsham (1005), he was a supporter of the Benedictine Reform and politically as well as ecclesiastically was of the same faction as Bishop Æthelwold of Winchester. William of Malmesbury believed that he founded Pershore Abbey, but this is not corroborated.

Æthelweard and Æthelmær were both patrons of the homilist Ælfric: an augmented copy of the first series of *Catholic Homilies* was prepared for Æthelweard, he commissioned Ælfric to translate parts of the Old Testament, and Ælfric's *Lives of Saints*—essentially a monastic collection—was written to meet the devotional needs of father and son; the life of Thomas was included at Æthelweard's request. Æthelweard is also famed as the author of a Latin "translation" of the Anglo-Saxon Chronicle, dedicated to his kinswoman Matilda, abbess of Essen and granddaughter of Emperor Otto I. Æthelweard's chronicle ends at 975; its source is not identical with any extant version of the Anglo-Saxon Chronicle, and it is consequently important for the history of the Chronicle, as well as for information that is not found elsewhere. It follows 10th-century Anglo-Latin fashion in being written in hermeneutic Latin, but there are features of the style that are distinctively Æthelweard's. An attempt has also been made to link Æthelweard's family with the early history of the Exeter Book, a major manuscript anthology of OE poetry.

Æthelwold of Winchester (ca. 904/09–984)

Influential monastic teacher and administrator, and a principal initiator of the English Benedictine revival of the second half of the 10th century. Born at Winchester perhaps between 904 and 909, Æthelwold passed several years, probably the late 920s and much of the 930s, at the court of King Æthelstan (924–39), enjoying the royal favor that was to characterize his career. Sometime between 934 and 939, in company with Dunstan, he was ordained priest by Ælfheah, bishop of Winchester. Æthelwold subsequently studied with Dunstan at Glastonbury Abbey, where he became a monk and was later appointed *decanus* (a position of authority over other monks). Desiring to experience reformed continental Benedictine practice at first hand, Æthelwold was prevented from traveling overseas by King Eadred (946–55), who instead appointed him (ca. 954) abbot of the derelict monastery of Abingdon, which Æthelwold restored energetically: he personally participated in the building work, sustaining serious bodily injury in the process. From Abingdon he sent the monk Osgar to observe Benedictinism as practiced at Fleury, and he summoned to Abingdon monks from Corbie who provided instruction in liturgical chant. Attention to continental models continued to mark Æthelwold’s later career.

In 963 Æthelwold became bishop of Winchester, an office he held until his death and in which he made a profound impact upon contemporary religious life. More severe than his fellow reformers Dunstan and Oswald, he swiftly (in 964) expelled the secular clergy resident at his cathedral and at New Minster, Winchester, and replaced them with monks. Subsequently he founded or refounded monasteries at several locations, notably Peterborough (966), Ely (970), and Thorney (972). He worked in close harmony with King Edgar (957–75), whose tutor he had been and whose royal palace stood close to Æthelwold’s cathedral. At the request of Edgar and his queen, Ælfthryth, Æthelwold translated the Rule of St. Benedict into OE. He was chiefly responsible for compiling the Latin document known as the *Regularis*

concordia, aimed at standardizing religious observance in the English monasteries and prompted by a council convened by King Edgar at Winchester sometime between ca. 970 and ca. 973. Æthelwold is justifiably believed to have been the author of a vernacular account of the monastic revival known as “King Edgars Establishment of Monasteries,” which he probably intended to serve as the preface to his translation of the Benedictine Rule.

Æthelwold’s work at Winchester included the rebuilding of the cathedral, which was equipped with a large organ remarkable for its time. He was responsible for reform of the liturgy and may have composed offices and prayers that survive in service books of his own time and later. Under Æthelwold Winchester became a major center of manuscript production, its most sumptuous accomplishment being the Benedictional made for Æthelwold himself by the scribe Godeman. A deeply learned man, Æthelwold presided over a monastic school at Winchester whose most distinguished students included his biographers, the prolific writers Wulfstan of Winchester and Ælfric. His students’ work ensured the continuation of Æthelwold’s influence beyond his death on 1 August 984. He was buried in the crypt of Winchester Cathedral and translated to the choir in 996.

Agincourt Carol

The best known of all English carols (also called the Agincourt Song), this composition celebrates the victory of Henry V at Agincourt in 1415 and was probably written shortly thereafter. It survives in two of the most important collections of 15th-century carols, the Trinity Roll (Cambridge, Trinity College O.3.58) and the Egerton Manuscript (BL Egerton 3307). Reference is made to the siege of Harfleur, success on the field at Agincourt, and the return to London in triumph with hostages. As is often the case, this carol mixes two languages. The *burden*, or framing refrain, is in Latin (“Deo gratias Anglia, redde pro victoria”), and the five strophes of verse are in English (“Owre Kynge went forth to Normandy,” etc.). Also as in a number of other carols, there are in fact two settings of the burden. These are presumably to be sung together, one after the other, in alternation with the verses. The first begins in unison and expands to two voices while the second is for three voices throughout. The verse is for two voices, with a memorable tune in the lower part. This tune has been retexted and reharmonized for congregational singing in some modern Protestant hymnals, where it is identified as “Deo gratias.”

Agriculture and Field Systems

The wealth that made the Anglo-Saxon kingdoms so attractive to Vikings and Normans was largely derived from the fruits of a fertile countryside already well cultivated and amply exploited. Almost all types of crops to be grown by English husbandmen (farmers) during the medieval centuries were already known to the Anglo-Saxons. The importance of wheat, barley, rye, beans, and peas is reflected in a large number of OE place-names (e.g., Wheatley or Benacre); only oats are poorly represented in the toponymic record.

Similarly the range of domestic animals, though not their breeds, would have been familiar to farmers 500 years later, and indeed today; pigs, oxen for the plow, sheep whose wool earned much wealth in foreign exchange, and horses, bred by magnates perhaps more as status symbols and for warfare than for plowing. Only the large flocks of goats (with no less than 13,400 enumerated on demesne lands in southwestern England in Domesday Book) would have been unfamiliar to a later farmer transported back to the 10th or 11th century.

However, the ways in which husbandmen arranged and deployed these familiar crops and animals on the ground differed greatly from one part of England to another. The only field system studied in much detail for the Anglo-Saxon period is the Midland System, whose rhythms and institutions were to dominate innumerable communities in a broad swath across the middle of England. Here the land of each village came to be divided into either two or three large prairielike fields, each used in turn for crops and then for common grazing. If, as scholars now believe, the system was a late Saxon innovation, necessitated by the diminution of rough pasture through reclamation so plowed land had to double up with grazing, its introduction reveals an early pressure on resources.

Developments after the Norman Conquest largely took the form of adjustments to combinations of the types of crops and livestock already mentioned; changes in emphasis, not radical new departures. Did growth in population to its peak around 1300 bring improvements in land use? Certainly the cultivated area, already extensive by 1066, was pushed forward. Unlike the great frontiers for colonization found on the Continent, attractive sites for reclamation were relatively restricted. They tended to be on poorer soils, a reason for a significant increase in the growing of oats, a tolerant crop. Oats

were not grown extensively in Anglo-Saxon times (unless the paleobotanical and place-name records deceive), and yet by 1300 there are many references to them, both on demesne lands and on peasants' farms. But the increasing use, on poor soils, of a crop yielding coarse fare and little food per acre can hardly be described as an improvement. It was conservative adaptation of a kind seen in other areas of husbandry.

Within the territory of the Midland field system there is no evidence of any major transformation from two to three fields, despite the increased cropped acreage such a change would have secured. The reason seems to be that two-field farmers knew that to push the land too hard would have diminished grain yields. The significant decline in goat keeping between 1066 and 1300 may be related to the need to conserve pasture and woodland, both scarce resources in some regions. Charters specifically ban goats as destructive; John Leland commented in the early 16th century on the connection between goats and the disappearance of woodland.

To say that no radical new departure in land use can be observed between 1066 and 1300 understates the vitality and local variation of agriculture and field systems. The desire for improvement is reflected, on the best-run demesne farms, in high standards of traditional husbandry. Much attention went to such details as weeding, crop choice, and the culling of sickly animals. It is difficult to believe that peasants did not strive for greater productivity within the restraints imposed by chronic shortages of capital and livestock, as they came under increasing financial pressures from landlords and the king.

Two examples of regional variation must suffice. On the poor sandy soils of the East Anglian Breckland wheat was grown hardly at all; a contemporary poem reflecting on high living at Peterborough Abbey ridicules the region as stripped of wheat by Satan. The main local grains were rye for bread, barley as a cash crop. By contrast farmers only 25 miles away on the rich coastlands of eastern Norfolk grew little rye but rather wheat, barley, oats, and legumes (beans, peas, vetches), with intensive rotations that made the region outstanding for productivity.

In a land where soil quality varies sharply over short distances, and where access to large urban markets was patchy, there were many other comparable local contrasts in the choice of crops. Presumably these differences were more strongly developed by 1300 than in the Anglo-Saxon period; increasing demands on peasants and a growing population of smallholders, forced to live off morsels of land, would have encouraged acute specialization in whatever crops the soil produced best. The same forces probably perpetuated local variations in field systems, which, outside the territory of the Midland System, we see in all their variety in 13th-century sources.

In the realm of power technology it is also difficult to discern major

improvements between the Conquest and 1300. That most basic of implements, the plow, was already developed in its essentials by 1066; long before the Conquest there is a reference in the Exeter Riddles to the plow's green "flank," the moldboard to turn the sod and smother weeds. Improved harness likewise predates the Conquest. After 1066 water-powered mills spread to areas where they had been rarely mentioned in Domesday Book, and after about 1190 windmills were introduced. Neither process improved agricultural output; they reduced work, but it was a populous age when labor was not at a premium and the ultimate gains went to lords in the form of tolls on milling. The most significant change in power technology was a partial replacement of oxen by horses in carting and plowing. This permitted greater efficiency in soil preparation and in carrying but did not strike at the adverse man-land ratios that were a chronic problem.

These ratios improved during the 14th century as population dropped to produce the "very thinly inhabited" countryside that a Venetian observer marveled at in the 1490s. The most important development during the later Middle Ages was an increase in the acreage of pasture at the expense of plowland, a reverse of the earlier trend. In the lowlands of Warwickshire, for example, the proportion of land under pasture rose from 7 percent to 33 percent. People were fewer; there was less pressure to produce cereals for bread; field systems relaxed like a fist unclenched. Better standards of living meant greater demands for animal products. Some farmers seized opportunities to produce vigorously for a cash economy, encouraging the emergence of nascent farming regions geared toward specialization for markets.

Improvements associated with the demand for pasture included enclosure, particularly in such regions as southwestern England, with its flexible field systems. From small beginnings in the 13th century the trend was also toward the greater use of legumes as food for humans and beasts. These changes did not take place without social dislocation, as when the fabric of some traditional arable communities crumbled away before a falling demand for grain, and depopulation was a further consequence. Yet in ecological terms the English countryside in 1500 had a far sounder base than in 1300. Systems of cultivation were less demanding, legumes enriched the nitrogen content of the soil, there was more grassland and livestock. The stage was set for the more revolutionary changes in agriculture and farm output that took place in the post-medieval centuries.

Alanus, J[ohannes] (d. 1373)

John Aleyn, a musician and administrator in royal service, was from 1363 to 1373 a canon of St. George's Chapel, Windsor, and from 1361 to 1373 a chaplain of the Royal Household Chapel of Edward III. The last decade of his career is

well documented, and he enjoyed the frequent and lucrative patronage of Edward and Queen Philippa, holding numerous benefices. Upon his death he bequeathed a book of music to the chapel at Windsor. Though the surname is common, this individual is the strongest candidate for the J. Alanus who wrote the extraordinary musicians' motet *Sub arturo plebs* and possibly also the motet *O amicus sponsi primus*. It is likely that he is the Alanus or Magister Alanus four of whose songs are preserved in the Strassburg Manuscript. Further, it is not ruled out on the basis of musical style that he is the Aleyn (or in the second case, less probably, the W. [?] Aleyn) to whom a lively cantilena-style Gloria (no. 8) and a smooth discant setting of a Sanctus (no. 128) are attributed in the Old Hall Manuscript.

Alchemy

Alchemy can be seen as the forerunner of modern chemistry. It was developed by the Arabs from the 7th century, based on the merging of mystical, scientific, religious, and philosophical doctrines dating from the late Roman Empire. Alchemy includes speculative elements—astrology, gnosticism, the Eleusinian mystery religion, Christian heretical notions, and Hellenistic syncretism—along with its scientific orientation toward empirical and laboratory analysis. Alchemy's main object is to transmute base metal into silver or gold by freeing crude materials from "impurities," and from this primary concern it directed

chemical experimentation toward and eventually beyond such goals.

Among the most important Arabic sources are alchemical treatises by Geber, Alchindus, Rhasis (al-Razi), and Avicenna. These works were transmitted to western Latin writers through the School of Toledo in the 12th century and appear in adaptations and expansions in alchemical treatises by Roger Bacon, Albertus Magnus, and others. A primary concern in these works is chemical change and the nature of materials, with a particular interest in properties of mercury that could be used in dissolving other metals. Gold- and silver-making feature as an important aspect in later writers. John of Rupescissa (fl. mid-14th century) and spurious works attributed to Ramón Lull (e.g., *Theoria*) pursue this line of inquiry.

By the late 13th century the emphasis became more focused on the notion of elixirs that induce chemical transformations. Rupescissa introduces the notion of elixir as having medical properties, a direction that was to become more important in the 16th century among such chemist-physicians as Paracelsus and Libavius. There was also an interest in the distillation of alcohol, seen as a fifth element or potent elixir, offering possibilities as an agent in causing change and transmutation.

Latin alchemical works received wide circulation in vernacular translations, paraphrases, and adaptations. Among the most popular authors was Arnald of Villanova (ca. 1240–1311), whose *Speculum philosophorum* was translated into ME as *The Mirror of Philosophy*. A work supposedly of Hermes Trismegistus, the *Dicta philosophorum*, was translated by Robert Frumitor as *The Words of the Philosophers*, and there are many other redactions of this text. John of Rupescissa's *Liber de consideratione quintae essentiae* became the *Book of Quintessence*, found in many 15th-century manuscripts, while Thomas Norton's *Ordinal of Alchemy* (ca. 1477) offers a verse compendium of many earlier alchemical works. Most of these "cookbook" manuscripts contain collections of alchemical recipes, many with marginal notations about their success or otherwise.

Because of the ambiguous and possibly heretical nature of alchemy it was never fully accepted by the church and had to be conducted as an occult and therefore a "pseudo-science." Perhaps the most poignant comment in this respect is found in a manuscript marginal note made by an English translator, possibly a Franciscan friar, of Rupescissa's *Book of Quintessence* (ca. 1485). He, being "at great unease in prison," nevertheless felt that alchemy could still be used for the "helping of man" and the "praise of God."

Alcuin (ca. 730/35–804)

The foremost educational leader of the 8th century, known in Latin as Albinus and in Charlemagne's court circle often as Flaccus (after Horace). After living nearly 50 years in York, he spent some twenty years working in the Frankish kingdom as adviser and teacher of Charlemagne and his court, architect of the Carolingian political, religious, and cultural reform, poet and voluminous author of letters and treatises, rectifier of the biblical text and liturgy, and in his last years abbot of Tours.

The brief *Vita Alcuini*, anonymously composed around 829, probably at Ferrières, at the direction of Alcuin's disciple Sigulf, contains amid its reminiscences and anecdotes disappointingly few facts. Little is known of Alcuin's life at York; however, with respect to his later career on the

Continent, no intellectual of the period is more amply documented. Alcuin's own letters (more than 300) and poems (more than 220), supplemented by Carolingian correspondence, chronicles, and histories, furnish us with considerable information about him. Born of noble family in Northumbria, he was educated at the cathedral school of York in its epoch as western Christendom's center of learning. His teacher and patron was Ælberht, whom Alcuin succeeded in 767 as master of the school, when Ælberht was raised to the episcopacy. Ordained as deacon, Alcuin never advanced to the priesthood and may not have taken monastic vows, even though in old age he expressed a wish to become a Benedictine monk at Fulda. Alcuin accompanied Ælberht on his travels and book-acquiring forays on the Continent, and by 778–80 he had already established a reputation among cognoscenti.

Alcuin would never have attained his subsequent renown if it were not for a momentous (though not his first) encounter with Charlemagne. In March 781, while bearing the pallium of archiepiscopal authority from Pope Hadrian I for Eanbald, Ælberht's successor to the see of York, Alcuin en route met Charlemagne at Parma. Charlemagne urgently requested him to join the Frankish court, with its prestigious group of scholars (Peter of Pisa, Paul the Deacon, Paulinus of Aquileia, soon joined by others), and to assist him in his educational and religious reforms. Alcuin forsook England to remain on the Continent for the rest of his life. He returned to England only twice, once in 786 to accompany papal legates to the synods at York and at the court of King Offa of Mercia, and once in 790–93 for a stay at York, during which time he was in correspondence with Charlemagne about the decrees of the Second Council of Nicaea (787), which the Carolingians mistakenly believed upheld the worship of images (iconolatry). However, the resulting doctrinal declarations, called the *Libri Carolini*, were made in his absence and therefore not by Alcuin. They are, judging from the script and biblical citations, probably by Theodulf.

His erudition, administrative qualities, pragmatism, and responsibility gave Alcuin immense influence with Charlemagne. In addition to his own works Alcuin more than any other in the royal entourage wrote documents, correspondence, capitularies, texts, and poems under the king's name. This is not to say that he functioned only as the king's *persona*; despite his service and extreme deference to the king Alcuin expressed himself to Charlemagne freely and sometimes reprovingly. Although he honored the king as divinely appointed defender, protector, and spreader of the church and guardian of the peoples mores as well as conqueror of nations, he insisted the king was not above the law. He protested strongly against the forced baptism and tithing of the constantly resurgent Saxons and urged that the same error not be repeated among the defeated Avars, whom he chose to call Huns. In old age he excused

himself from journeying to the king or accompanying him in battle or at the papal court. As abbot of St. Martin's he granted sanctuary to a condemned cleric, much to the chagrin of the culprit's bishop, Theodulf of Orléans, and of the king himself.

Traveling with Charlemagne's itinerant court until 794, when the palace of Aachen became a capital, Alcuin was the central figure of a brilliant corps of scholar-poets creating the Carolingian renaissance. This academy was responsible for mythologizing the Germanic kingdom into a new Athens, a new Rome, and a new Jerusalem. Even though Theodulf of Orléans has been judged a better poet, Alcuin's own activity as a contributor to the myth and to the body of Carolingian Latin poetry is remarkable. He composed verse epistles, inscriptions, epigrams, hymns. To his pupils he wrote lighter, more lyrical verse. The artifice of his acrostic poems addressed to Charlemagne and to the Cross demonstrates his knowledge and control of late-antique Latin prosody. His elegies are particularly notable. 'O mea cella' and "The Nightingale" have been often anthologized. The elegy on the Viking destruction of Lindisfarne in 793 is one of three longer poems; the others are his metrical life of St. Willibrord and the often-cited poem *The Bishops, Kings, and Saints of York*, which contains much valuable information about the school of York, its library (probably the best in Europe), and its personalities.

As master of the court school Alcuin wrote a number of educational texts. He resurrected Cassiodorus's system of the seven liberal arts but in his treatises concentrated on the disciplines of the trivium: grammar (including a work on orthography), rhetoric, and dialectic. His *De orthographia*, his instruction in computus (calendrical reckoning), and some of his exegetical works (e.g., on John's Gospel) are revisions of Bede's works. He probably authored the little educational piece of mathematical conundrums, *Propositiones ad acuendos iuvenes*. He is responsible for spreading the *Categoriae decem*, a version of the Latin Aristotle. He compiled biblical commentaries on Genesis (questions and responses), some Psalms, the Song of Songs and Ecclesiastes, John's Gospel, Revelation, and the letters of Paul to Titus, Philemon, and Hebrews. His hagiographic works consist mainly of reediting lives of saints important to Francia: he reworked the biographies of Martin of Tours, Richarius, Vedast, and Willibrord. Alcuin also produced three moral tracts: one on the virtues and vices (a popular work), another on the nature of the soul, and the third, for the boys at St. Martins, on confession of sins.

In the area of liturgy Alcuin made major contributions. He took charge of removing errors of transcription from scriptural and liturgical texts and bringing them into conformity with Roman usage. He assembled a *comes*, a lectionary of epistles for the mass. He produced a revision of the Hadrian (so-

called Gregorian) mass book, but the supplement and its preface, long attributed to him, are probably the work of Benedict of Aniane (ca. 750–821). Alcuin composed a set of beautiful votive masses, eventually incorporated into the Roman Missal, which drew upon the Irish-English tradition of intense personal piety put to the service of public prayer. He also introduced Hiberno-English customs, such as the recitation of the Creed at mass (newly formulated with the *Filioque* clause by Paulinus of Aquileia) and the celebration of the Feast of All Saints.

The western christological doctrine called adoptionism propounded by Elipand of Toledo and Felix of Urgel, namely, that Jesus Christ in his human nature was not the natural Son of God but an adopted one, was vigorously rebutted as heretical by Charles's theologians, Paulinus and Alcuin. It was condemned at the synods of Regensburg (790), Rome (798), and Aachen (800). Although in the controversy Paulinus proved the better theologian, Alcuin participated energetically, writing three hasty apologetic treatises in response to the heresy. A more successful foray into theology is Alcuin's later tract on the Trinity, heavily indebted to Augustine's *De Trinitate* but demonstrating Alcuin's own sophisticated reasoning.

In 796 Alcuin had asked to retire as a monk at Fulda, sacred to the memory of Boniface; but Charlemagne in granting him leave made him abbot of Tours, where he remained until his death on 19 May 804. From Tours he wrote some of his most famous letters to kings, bishops, and monks in England, especially Northumbria. While lamenting the depredations of the Vikings, he exhorted his countrymen to courage and virtue. In keeping with Charlemagne's campaign to reform and publish sacred texts Alcuin resolved to correct the textual corruptions in the Vulgate Old and New Testaments, and the resultant (now lost) Bible was presented to Charlemagne in Rome on the day of his coronation as emperor, Christmas, 800. Alcuin's role in arranging for the coronation itself was like so much of his activity for the king—both behind the scene and effectual. Alcuin's leadership in creating better Latin texts led to increased care and production in Frankish scriptoria; his name is therefore associated with the creation of the Carolingian minuscule handwriting developed during the period (even though he himself continued to use insular script), and with the superb Bibles produced at Tours, which actually postdate him.

There were in the court of Charlemagne others who may have been better at grammarians or poets or diplomats or exegetes or theologians or liturgists, but Alcuin, confidant and friend of the king, not only practiced all these professions, he also taught, guided, and served as a model for each of them.

Aldhelm (6407–709/10)

The learned founder and first major figure of Anglo-Latin letters. Aldhelm was born of noble family with royal connections in Wessex about the time of the districts conversion to Christianity. We have few details of his life. Of his education William of Malmesbury relates, without citing the source of his information, that Aldhelm received his early training from one Máelduib at the ancient Celtic foundation of Malmesbury. Later he studied under the abbot Hadrian in the renowned school of Canterbury but left after as little as two years, for health and other reasons. In one letter from Canterbury written between 670 and 673 Aldhelm lists the subjects he was then pursuing, including Roman law, 100 types of meter and poetic devices, the principles of mathematical calculation (especially fractions), and astrology (the interpretation of the zodiacal signs).

Earlier scholars hypothesized that Aldhelm learned his showy latinity from Irish tutors like Máelduib, but recent specialists have established a convincing link between Aldhelms writings and the work of continental grammarians and poets, who gloried in the same pompous style. Aldhelm somehow acquired an astonishing command of sacred and profane literature as he developed his extraordinary skill in writing ornate Latin.

He became involved in ecclesiastical affairs, attending a synod at Hertford in 672 and becoming abbot of Malmesbury ca. 673. He was very active, traveling to Rome and to sites in southern England; he labored to establish the church in Wessex physically (he built or rebuilt several churches) and spiritually (Bede speaks of his energy and zeal). When Bishop Hæddi died in 705, the vast diocese of Wessex was split into two, with sees at Winchester and Sherborne. In 705/06 Aldhelm, well acquainted with neighboring Devon and Cornwall, was unsurprisingly chosen and consecrated bishop of the western portion, Sherborne. He presided over his bishopric for four years until his death in 709/10.

For Aldhelm Latin was not only the language of Christian culture; it was also the language of the clerical elite. He therefore fostered a hermeneutic style

of the initiate, whose most striking feature is the ostentatious parade of unusual, arcane, and learned vocabulary. Both his prose and poetry exhibit florid ornament, especially alliteration and rhyme. Aldhelm's extant prose writings include a dozen letters. In epistles to his students Heahfrith and Wihthfrith he tries to convince them of the advantages of English over Irish education and demonstrates his point by outdoing the rhetorical excesses of Celtic Latin (e.g., every one of the first fifteen words of his letter to Heahfrith begins with *p*). In his letter to Geraint, king of Dumnonia (Devon), he discusses the reckoning for Easter, a much-debated topic in the 8th century among Irish and continental clerics; and in a letter to the bishop of Wessex he addresses computistical matters in addition to metrics.

His weightiest letter is the *Epistola ad Acircium*, addressed to the well-educated King Aldfrith of Northumbria (686–705). The preface of this massive tract includes the longest recorded disquisition on the allegorical significance of the number seven; the main body of the letter contains two complementary treatises on Latin metrics. To illustrate the properties of the hexameter he inserts 100 *Aenigmata*, following the example of the late Latin poet Symphosius. These *Aenigmata*, or *Riddles*, which express the mysterious nature of things, proved popular in early-medieval Europe but especially in Anglo-Saxon circles, where they were imitated in Latin (by Tatwine, archbishop of Canterbury 731–34, Eusebius, and Boniface) and OE (in the Exeter Book Riddles).

Aldhelm's longest and most notable work was a treatise on chastity, *De virginitate*, composed for Abbess Hildelith and her nuns at Barking Abbey. The topic was a favorite patristic subject, and the method of composition was also traditional, with one version in prose and another in verse, a procedure (termed *opus geminatum* or *stilus geminus*, "twinning work" or "twin style") practiced by late Latin writers like Juvenius and Caelius Sedulius and subsequently by Bede, Alcuin, and Hrabanus Maurus. But Aldhelm's texts are most unusual, for, unlike other authors whose poetic versions were much more ornate than the prose counterparts, Aldhelm's dazzling prose is if anything more obscurantist, *recherche*, and artificial than the poetic version, which is also highly embellished. After an elaborate introduction on the nature, value, and difficulties of virginity the prose text presents a catalogue of male virgins from the Old Testament to the Church Fathers; this is followed by a catalogue of female virgins similarly ordered, with some further considerations of Old Testament patriarchs; before ending, Aldhelm denounces showy dress worn by ecclesiastics.

The poetic twin shares the general structure of the prose version, with the sequence of male and female exemplars, but it ends quite differently, with a long allegorical confrontation between the virtues and vices. Although the

poems hexameters are metrically limited and tiresomely repetitious, his vocabulary is formidably extensive. This 2,904-line *carmen* is the first full-scale Latin poem to be composed in the British Isles; Aldhelm, who compared himself to Virgil, was aware of its significance and his achievement.

The influence of Aldhelms writings on his contemporaries and on the following generation can be measured by their imitation of his style. His student Æthilwald produced four poems in continuous octosyllables, clearly modeled on Aldhelms *Carmen rhythmicum*. Alcuin, whose soberer style reflects the writing of Bede, also owes something to Aldhelm. Many short Latin poems from the Anglo-Saxon period are nothing more than centos woven from Aldhelms poetry. Aldhelms dense prose had even more imitators. Felix of Crowland is surely indebted to him for the elaborate and verbose prose style of his *Life of St. Guthlac* (ca. 740). The great missionary Boniface and his coterie of English correspondents write Aldhelmian prose, as does Boniface's biographer, Willibald, and the biographer of Sts. Willibald and Wynnebald, the nun Hygeburg. Later Latin writings of the time of King Alfred and especially of the time of the Benedictine Reform (late 10th and early 11th centuries) likewise reveal Aldhelm's influence, diminished finally only after the Norman Conquest.

Alfred and Minster Lovell Jewels

These two late Saxon jewels consist of enameled upper sections, gold with filigree and granulation, and narrow tubes below. They differ in iconography, size, inscription, and the Alfred Jewels (Oxford, Ashmolean Museum 1836, 371; [fig. 1](#)) rock-crystal covering (probably Roman, reused, determining the jewel’s shape). They provide the best technical and stylistic parallels for each other, and were probably made in the same shop. They are significant for their association with Alfred the Great, their evidence of luxury metalwork production after Sutton Hoo, and their introduction of foliate motifs later common in Winchester manuscripts.

Style places both metalwork and enamel in late-9th- or early-10th-century England. The Alfred Jewel’s inscription provides a narrower date: +ÆLFRED MEC HEHT GEWYRCAN (Alfred ordered me to be made). The mixed Anglian and Mercian, the royal formula (*heht gewyrcan*), the object’s richness, and its find-spot (Somerset) indicate that the patron was King Alfred (871–99), confirming Assers claim of such patronage.

The Alfred Jewel’s enamel shows a half-length male figure on a stool, eyes toward the lower left. He holds two long strips, linked at the bottom center, with top elaborations. Bakka identifies these strips as flowers with distinct parts and curved stems. Others see flowered scepters. The irregular workmanship makes it possible that rigid staffs were indeed intended. Readings as a priest’s rods, staffs with meat (for the Ascent of Alexander, but with parallels geographically remote and chronologically uncertain), or a looped cord binding two birds (with questionable Swedish parallels) are unconvincing.

The figure could be a saint, a king, Alfred (in unlikely portraiture), or the

pope (referring to a ceremony now disputed). It is probably either Christ or the sense of sight. Although unnimbed and glancing sideways, it resembles the Christ with two rods in the Book of Kells: perhaps the Wisdom of God. It could also represent Sight, as on the Fuller Brooch: a large-eyed frontal figure holding two plants (Bakka). Without the Brooch's other senses for programmatic verification, this is uncertain. The back foliate ornament and animal-head socket below are probably iconographically insignificant.

Fig. 1. The Alfred Jewel (Oxford, Ashmolean Museum inv. no. 1836, 371). Courtesy of the Ashmolean Museum, Oxford.

The Minster Lovell enamel shows a small cross or star within a larger

Anglian cross.

The functions of the two objects are generally considered together, since both have similar narrow tubes. These must have held something, and since the Alfred Jewel's securing rivet is still in place, the lost part was probably organic. Proposed functions include pendants (with attached chain and upside down, improbable); dress pins (too heavy); and battle-standard ornaments (too small and delicate). Both could have adorned a crown, the larger in front; but different find-spots make it unlikely that they formed parts of the same object, and such Saxon crowns are unknown.

Many connect the jewels with Alfred's preface to Gregory, which specifies the attachment to each manuscript of an *aestel* worth 50 gold *mancuses*. The definition of *aestel* is unknown; linguistic evidence suggests a pointer, bookmark, or wood splinter (of the True Cross?). Most scholars define it as a pointer for following the text, and see the jewels as handgrips for such pointers. The iconography of both the Minster Lovell cross and Christ or Sight would fit this use. The Alfred Jewel's figure, however, would be held upside down; the two jewels are not equally costly, although the text gives a standard value for all *aestels*; and, most significantly, neither object shows wear from being held.

Another theory interprets the jewels as terminations of a scepter. Royal scepters were used in England by the 10th century, and perhaps in the 9th. Carolingian illustrations, which the Saxons may have imitated, show similar forms. The jewels' tubes are small but could have been attached to narrow projections like those terminating the Sutton Hoo "whetstone" and the Cologne scepter (Werner, 206). Both are fragile, but the Alfred Jewel has seen hard use, as demonstrated by a break above the animal-head socket.

The Alfred Jewel probably terminated a staff, possibly a scepter. The Minster Lovell Jewel could have been differently used (e.g., as a dress pin, since it is lighter), or similarly, though on a different object, as indicated by the different find-spots. No certain answers to questions of iconography and function can be given.

Alfred the Great (849–899; r. 871–99)

History

Youngest son of Æthelwulf, king of Wessex, Alfred was born at Wantage, Berkshire, in 849. This is recorded in Assers *Life of King Alfred*, written during Alfred’s lifetime and dedicated to him. In 853 Æthelwulf sent Alfred to Rome, where he received a special investiture from Pope Leo IV (844–55). Though this ritual is depicted by the Anglo-Saxon Chronicle and Asser as an anointing to kingship, in 853 Alfred had three elder brothers living. Asser also claims to have from Alfred the story of how his mother, Osburh, promised a book of “Saxon songs” to whichever son could learn it first; the winner was Alfred.

When Æthelwulf married the Carolingian princess Judith in 856, Alfreds eldest brother, Æthelbald, revolted and assumed rule of Wessex, while Æthelwulf retained Kent, Surrey, and Sussex until his own death in 858, when Æthelbald succeeded to the whole kingdom. After his death in 860 his brothers Æthelberht (860–65), then Æthelred (865–71), ruled in turn. No further partition occurred. Though Alfred was depicted by Asser as heir-apparent in the late 860s, his chances of succession were slim, since Æthelred had two sons.

In 865 a large army of Danes landed in East Anglia and in 866–67 gained control of Northumbria. In 868 Danes attacked Mercia, and Alfred joined King Burgred (his brother-in-law) in a campaign of limited success. Alfred now married Ealhswith, a Mercian noblewoman of royal descent. Asser reports that Alfred was struck down by a mysterious illness at his wedding and interprets this as divinely sent preventive medicine against pride.

In 869–70 Danes took control of East Anglia, killing King Edmund. Raids against Wessex began. When Æthelred died in 871, Alfred succeeded, excluding Æthelred’s sons; their supporters were overruled. Wessex came under attack from several Danish warbands. Under 871 the Anglo-Saxon

Chronicle records nine battles, most of which Alfred lost. He probably bought off attackers with tribute; his coinage became increasingly debased. In 874 Burgred departed for Rome, leaving Mercia to be partitioned between a coalition of Danish warlords and a new Mercian king, Ceolwulf. Though the written record is silent, joint coinage suggests that Alfred and Ceolwulf sometimes allied. In 876 and 877 Danes raided far into Wessex. At Wareham and Exeter Alfred pursued Danish warbands, paying tribute to induce their withdrawal. Protests from the archbishop of Canterbury imply that he extracted substantial contributions from churches, as did Carolingian contemporaries.

In January 878 a Danish force under Guthrum surprised Alfred at Chippenham, Wiltshire, and obliged him to withdraw to Athelney, Somerset, whence with his “vassals” he “harried Danes and Christians who had accepted Danish lordship” (Asser, ch. 53). In May 878 Alfred defeated Guthrum at Edington, Wiltshire. Guthrum made peace, accepting baptism and agreeing to leave Alfred’s kingdom. In 879 some Danes withdrew to Mercia and then to East Anglia, while others went to Francia (the “French” or western portion of the Carolingian Empire). Victory at Edington enabled Alfred to recruit further support. It was probably now that a defector, the ealdorman of Wiltshire, was punished by loss of office and lands. Also at this time the coinage was reformed.

During the 880s, with Danes active in the Thames estuary and in Francia, Wessex was unscathed. By 883 Ceolwulf was dead and Alfred established overlordship of western Mercia, with a Mercian noble, Æthelræd, as his ealdorman. Leading Mercians joined Alfred’s court; some West Saxons probably gained Mercian lands. A formal peace was made with Guthrum, leaving Alfred in control of Mercia west of Watling Street, the old Roman route that divided the southwest and the northwest. In 886 London, “restored” by Alfred, was handed over to Æthelræd, who married Alfred’s daughter Æthelflæd.

Alfred used both preexisting and new fortified settlements to organize a system of burhs covering his kingdom. A few, like Winchester, were intended as political and fiscal centers. Basically the burhs’ function was military; garrisoned by mounted warriors (thegns), they could act as refuges and launchpads for counteroffensives. The followers of Alfred and his magnates (ealdormen and probably bishops) were coordinated with the *burh-thegns* (Anglo-Saxon Chronicle, 893). Alfred thus imposed heavy burdens on his nobility.

To secure cooperation Alfred wanted to retrain nobles to think of themselves as an aristocracy of service. Books purveying the service ideal and enhancing royal authority were translated into OE, and bishops were

mobilized to ensure their distribution; nobles were told to learn to read and threatened, if they failed, with loss of office. Since Alfred personally participated in the translation project, it offers a unique window on the mind of a medieval king. Royal patronage attracted scholars from Mercia, Wales, and Francia and inspired the production of the Anglo-Saxon Chronicle and *Assers Life*.

Danish attacks on Wessex resumed in 892 after their defeat in Francia. Alfred was better prepared. The Anglo-Saxon Chronicle for the years 893 to 896 is essentially a record of success, including a minor naval encounter. Alfred suffered less from Danish onslaughts than from “high mortality among his best thegns.”

Alfred’s law code probably belongs to this decade. It was to apply in Mercia as in Wessex. Some clauses were monuments to Alfred’s talents as judge; others asserted the claims of lordship, especially royal lordship. Perhaps following Carolingian models, he imposed the death penalty for treason and probably demanded a generalized oath of fidelity. He secured acknowledgment of his overlordship from Welsh princes, weaning Anarawd of Gwynedd from alliance with the Danes at York. The marriage of Alfred’s daughter Ælfthryth with Count Baldwin of Flanders signaled a new West Saxon involvement, on Alfred’s terms, in Carolingian politics. Alfred sought to avert dynastic disputes by arranging for sole succession of his elder son, Edward, to his expanded kingdom, acknowledging Edward’s infant son, Æthelstan, as a future king. Alfred died in October 899.

Though claims have been made for Alfred as an innovator in law, military organization, and economic planning, his essential success was political. He enhanced West Saxon royal power both practically, extending his control over part of Mercia and dealing ruthlessly with opponents, and ideologically, by publicizing Bede’s construct of the unity of English-kind and by winning aristocratic consensus. His posthumous reputation grew, helped by such legends as the 11th-century tale of how he allowed a peasant woman’s cakes to burn as he mused on the fate of Wessex and the apocryphal 13th-century *Proverbs of Alfred*. It reached an apogee in his Victorian representation as father of the navy and founder of liberties and national unity. At least in proclaiming Alfred’s greatness these myths have a grain of truth.

Alfred’s Influence on Learning

In spite of what he described as the “various and manifold preoccupations” of his kingdom, King Alfred not only achieved considerable political success but

also instigated and made a major contribution toward the revival of learning in Anglo-Saxon England. In a letter prefaced to his *Pastoral Care* he relates, not without some rhetorical exaggeration, how greatly education had declined by the time that he came to the throne, with few people able to understand Latin, the language of learning. For Alfred learning and the wisdom that could be acquired as a result of it were essential to the spiritual as well as to the economic health of his kingdom: loss of wisdom, he believed, brought with it calamity. Aware that many who did not know Latin could yet read English, he resolved to provide essential texts in the vernacular and called on his scholars to join him in translating those books that were “most necessary for all men to know.”

Alfred himself produced three major works—the *Pastoral Care*, the *Consolation of Philosophy*, and the *Soliloquies*—writing mainly in prose but partly in verse; he was apparently also the translator of the first 50 prose psalms of the Paris Psalter. In addition he incorporated translation from the Bible into an important preface to his collection of laws, which set out his concepts of law and lawgiving. How far his colleagues responded to his request for translation is not known. Only one other attributable vernacular work has survived from the late 9th century, Wærferth’s translation of Gregory’s *Dialogues*, and Alfred’s preface to this work tells us that it was commissioned for his personal use, that he “might occasionally reflect in his mind on heavenly things amid these earthly tribulations.” However, he acknowledges the help of four people in his *Pastoral Care*, while the anonymous translations of Orosius’s *Seven Books of History against the Pagans* and Bedes *Ecclesiastical History*, both of which were once wrongly attributed to him, probably date from this period and may also have been undertaken as part of his plan.

Alfred is sometimes described as father of English prose. His patronage and personal involvement in translation must have contributed to the acceptance of the vernacular as an appropriate medium for serious subjects. His works were still being copied in the 12th century. At the same time there seems to have been a flowering of prose literature in the last part of the 9th century. Works apparently composed in this period include not only the OE Orosius, the OE Bede, Wærferth’s translation of the *Dialogues*, and Alfred’s own compositions but also the first sections of the Anglo-Saxon Chronicle and the OE *Martyrology*. The Bede and the *Dialogues* follow their sources faithfully. Alfred’s translations and the OE Orosius, in contrast, are rarely word-for-word. The *Pastoral Care* is essentially a paraphrase of Gregory’s *Regula pastoralis* with explanations and expansions, including a metrical epilogue, based on John 7:38. Gregory was writing for those in authority in spiritual matters, advising “rulers” both how to order their own lives and how to advise

the different types of people in their charge, but many of his injunctions applied to the exercise of authority in general and had come to be seen as applicable to secular rulers. In Alfred's hands it becomes virtually a treatise about power and authority.

Liberties are also taken with the text in the prose psalms: Alfred demonstrates a surprising willingness to modify scripture here and elsewhere, with explanation and comment freely inserted. So, for instance, the scribe's quill of Psalm 44:2 is "Christ, the word and tongue of God the Father"; the king's daughters of verse 10 are the souls of righteous men, while the queen is the Christian church. To all the psalms except the first are prefixed brief introductions, giving their meaning at several levels, including their significance for every human being. Indeed, what makes Alfred's writings of peculiar interest and importance is the way the king has modified and added to the substance of his (often learned) Latin originals, in order to render them intelligible to Anglo-Saxons, familiar only with a limited amount of writing in the vernacular, and, where appropriate, even to change the arguments, to bring them into line with his own thinking.

The texts in which Alfred demonstrates the most independence are the renderings of Boethius and Augustine. In the *Consolation of Philosophy* Boethius, writing in the Platonic tradition, sought to demonstrate the divine ordering of the universe without appeal to Christian revelation. Alfred, reading the work in the light of the Christian perspective of his day and as a ruler, accepting the doctrine of merit and the forgiveness of sins, rejects a number of Boethius's ideas and recasts his source. He makes substantial changes to passages involving the Platonic doctrine of Forms, the conception of a World-Soul, and a belief in the preexistence of the soul. The personifications *Natura* and *Fortuna* are removed; Lady Philosophy becomes *se heofoncund wisdom* (masc. "divine Wisdom") or *gesceadwisnes* (fem. "Discrimination, Reason"), while her interlocutor "Boethius" is frequently replaced by *Mod* ("Mind"), with the effect of making the speaker appear less of an individual and more of a representative of humanity. Many references to Boethius that are of a personal nature are removed, and attitudes reflecting the circumstances in which the original was written are softened. Boethius, the philosopher-politician, imprisoned and about to be executed by the king he had served, attacks the pursuit of wealth, position, power, and fame, all of which come under Fortune's jurisdiction and fall in abundance on the most wicked people. Alfred, the ruler, sees power and wealth as both necessary and potentially good, having been bestowed on men by God so that they may do his will. Honor and fame are not to be rejected, and it is right that a man's reputation should live after him as an encouragement and example to others. In transforming his Latin original in this way Alfred resembles the translator of Orosius, who also

takes great liberties with his text and moves from an exercise in polemic, showing how evils have ever occurred in cycles, to a demonstration of God's mercy as manifested through and after Christ's birth. However, both Alfred and the Orosius translator preserve the structural divisions of their sources.

A different kind of freedom is exercised in the work known as the *Soliloquies*. A lengthy allegorical preface is followed by an adaptation of Augustine's *Soliloquies* reflecting the king's major concerns; subsequently Alfred draws on Augustine's *De videndo Deo*, the Bible, and works by Gregory the Great. The text, organized in three books, for much of its length follows Augustine in using dialogue form: the speakers are *Mod* ("Mind") and *Gesceadwisnes* ("Discrimination" or "Reason," Augustine's *Ratio*), and the subjects explored include the nature of God and of the soul, the eternal qualities of knowing, what constitutes Truth, and the many roads to Wisdom, that is, to God. Much space is devoted to the subject of the immortality of the soul, in an attempt to reply to a question asked by Augustine at the end of his *Soliloquies* but not answered there.

The interest of Alfred's works for the modern reader does not, however, lie solely in the modifications of substance that he makes to his primary sources. The perceived need for clarification has resulted in many minor additions and modifications, a need met also in the Orosius, where the Latin author's assumption of classical and historical knowledge in his audience has led the OE translator to make an extraordinary number of expansions—telling the story of Regulus, for instance, or the Rape of the Sabines, or Cato's suicide. Alfred similarly fills in a number of details, such as the fate of Busiris, and relates at some length the stories of Orpheus and Eurydice and of Ulysses and Circe. Like the translator of the Orosius he has drawn his material from an impressive range of classical and patristic sources, though whether directly or via an intermediary cannot be determined. In the case of the *Pastoral Care* we know, from Alfred's own preface, that the king had the work explained to him by the group of English, Welsh, and continental scholars he had gathered round him. The introductions to the Psalms and some of the explanations within them appear to be derived from written commentaries. Boethius's *Consolation*, according to William of Malmesbury, was explained to Alfred by Asser, though whether orally or in writing is not stated. Attempts to identify a written form of Asser's explanation have so far failed. The use of a commentary or glossed manuscripts might account for a number of the additions in Alfredian texts (as, for instance, the many identifications of biblical quotations in the *Pastoral Care*) but cannot be proven for these or indeed for the new information in the OE Orosius.

Another important and interesting group of changes reflects attempts by the king to modify the severity of some of the harsher pronouncements of his

sources. So, for instance, when Gregory's *Regula pastoralis* states that all sins will be punished on Doomsday, the *Pastoral Care* refers to all sins that are unatoned for; when Gregory condemns those who abandon a good work unfinished, Alfred inserts the words "willingly and deliberately"; when Gregory quotes the statement from James 4:4 that one must not become a friend of the world, Alfred supplies the important qualification, "too immoderately." Gregory's list of sins for which God will make exception is extended to include not only sins committed out of ignorance or folly but also those committed from the instincts of the flesh or from weakness of character or from infirmity of mind or body. Similarly, in the Boethius translation, Alfred regularly reminds his reader that punishment can be avoided by repentance and constantly stresses God's mercy: God judges by the good will and not by the performance. In the Psalms the statement that God hates all who work iniquity is modified to apply only to those who do not abandon it or repent of it, and a similar qualification is added to the claim that "those who do evil shall be exterminated." In the *Soliloquies* as in the Boethius, the king refuses to agree that wealth is necessarily bad and that honor should be abandoned unless it is excessive. Perhaps the most interesting "minor" changes, however, are those that involve making potentially difficult points more accessible through simple and familiar analogues.

Alfred's love of expanded metaphor and simile manifests itself in his preface to the *Soliloquies* as well as in the body of his works. Favorite themes include flowing water and ships; others reflect the preoccupations of a ruler and the everyday concerns of his people: the ways to a king's court, for instance, or the relationship between a man and his lord, or the building of a dwelling. A Boethian simile comparing the universe to a number of spheres turning on a center, is replaced by an elaborate and carefully sustained image, explaining the relationship between various sorts and conditions of men and God in terms of a wheel set on an axle.

The chronology of Alfred's works is not known. The only vernacular text mentioned by Asser in 893 is the *Dialogues*. However, this may be because the *Life of King Alfred* was never completed. Equally inconclusive is William of Malmesbury's claim that Alfred was working on the Psalms at the time of his death: he may have drawn his conclusion from the fact that only the first 50 psalms had been translated, even though the practice of subdividing the Psalter into units of 50 seems to have been a common one. It is probable, however, that the *Pastoral Care* (circulated ca. 890–95) was the first of Alfred's translations, while verbal echoes may (less certainly) suggest that the *Soliloquies* followed the Boethius, which in its turn may have been later than the anonymous Orosius, a text possibly completed as early as 890 or 891.

Aliens and Alien Merchants

Merchants from many nations traded relatively freely in England before national customs were systematically imposed in 1275. Attitudes toward different nationals reflected shifting patterns of commercial rivalry as well as the government’s diplomatic and fiscal policy. English monarchs generally welcomed alien merchants because they paid higher customs duties than denizens and they provided valuable financial services. The Italian bankers, the Peruzzi and Bardi, were the most notable aliens active in English affairs. Besides the Italians major groups of merchants were those of the Hanse and the Low Countries; there were fewer Scandinavians, Spaniards, Portuguese, and French.

The number of aliens and their economic contributions can only be estimated. The Italians and the Hanse dominated the wool trade between 1257 and 1320, but thereafter the English handled over two-thirds of its volume. During the 14th century denizens gradually took over the bulk of the wine trade, and the Gascons who had previously controlled it retained but one-fourth or one-fifth of the activity. The Hanse concentrated on exporting cloth through east-coast ports, in close competition with merchants from the Low Countries. The Italians directed most of their trade through Southampton and London, while their banks were based mainly in London in the 14th and 15th centuries.

The *Carta mercatoria* of 1303 established a favorable framework for alien entrepreneurship, and the law merchant, evolving in the later Middle Ages, covered mercantile transactions. Some groups of aliens, such as Flemish textile

workers, settled in England. All aliens were subject to and had access to English common law while in the realm. Some acquired royal letters of denization, and some became freemen of individual boroughs, where they could inherit movables but not real property.

On occasion aliens could be numerous in a particular locality; in 1304 about 480 alien traders resided in Hull. There, as in other major ports where they gathered, especially in London and Southampton, hosting regulations required each alien to lodge with a denizen during the 40 days permitted for the completion of business. Besides those from the Continent two other groups attracted attention: the Scots, traditional enemies, were particularly disliked in the north, and the Irish, subjected to special trading regulations in Bristol and Chester.

Allegory and Related Symbolism

In this article “symbolism” is used in a broad sense, to mean “forms of signification,” with allegory being considered as the most characteristic form of medieval symbolism. Color symbolism, number symbolism, and name etymology will be considered together with allegory.

“Allegory” (Lat. *allegoria*, from Gr. *allēgorein*, “other-speaking”; also

alieniloquium) can refer to a method of critical analysis more properly called allegoresis; to a literary image; and to a form of narrative fiction. Hence we talk about works as being read allegorically, or as containing allegorical imagery, or as being allegories. Allegory originated in the ancient Greek belief that the gods reveal themselves cryptically to the wise. When allegory is in operation, literary fiction is subordinated to an idea that is considered to be hidden by an *integumentum*, or “covering.”

As a method of reading literature allegoresis seeks to discover the concept presumed hidden in the fiction. As a literary image allegory renders a concept in the form of a person or a thing. The best-known form of allegory is *personification*, in which a concept is represented by a person—e.g., Langland’s Lady Meed—but the concept may also be represented by an object, as in the case of Chaucer’s House of Fame.

The other chief form of allegorical imagery is *typology*, which correlates an Old Testament personage or event, called the “type,” or *figura*, with a New Testament or extrabiblical personage or event, called the “antitype.” David as king of the Jews foreshadows Christ as king of all humankind, and the Flood foreshadows the sacrament of baptism (see Daniélou). In various places in the Gospels Christ spoke of himself as fulfilling Old Testament prophecies, and in the Acts there are attempts at proving that the Old Testament anticipated the New, but it was Paul who polemicized these correspondences in his epistles. “Allegory” in the sense of typology is used as early as Galatians 4:22–24.

Although much allegorical interpretation can be called vertical—uncovering layered meanings within a single text—typological interpretation can be called horizontal, since it operates between texts or parts of texts. A *figura* may be distinguished from a personification in that a *figura* retains a largely literal role as a character in the narrative even as it takes on allegorical significance (see Auerbach). Whether typology was a compositional strategy in medieval literary texts is debated; however, because biblical typologies were popularized in didactic narrative (e.g., *Cursor Mundi*), sermons, the liturgy, and figural art (e.g., stained-glass windows), they were widely known, occurring in such diverse medieval English works as the Corpus Christi plays, religious lyrics, and the Prologue to Chaucer’s *Prioress’s Tale*.

Viewed as a literary form, “allegory” refers to a narrative whose entire reference is to something outside of itself and that contains various allegorical images, often arranged into episodic scenes serving as cues for interpretation. *Piers Plowman* and *The House of Fame* are allegories.

Allegorical Interpretation

Historically allegoresis, or reading allegorically, precedes the writing of allegorical works. Allegorical methods of reading developed primarily in connection with commentaries on classical mythology and the Bible. Greek commentaries on Homer resorted to allegoresis in order to defend his portrayal of the gods from the rationalist, demythologizing challenges of the pre-Socratics. Later the Jewish tradition exemplified by Philo (d. A.D. 50), which practiced allegoresis as a response to difficulties in the biblical text, helped advance allegoresis as a means of scriptural apology, explication, and teaching. Considering it a divinely inspired foreshadowing or “promise” of the New Testament, Christians under Greek influence read the Old Testament typologically, rather than rejecting it.

Applied to the Bible, allegoresis became a means for uncovering spiritual truths, which Augustine characterized as a process of removing the husk from a kernel of truth (*De doctrina christiana* [*On Christian Doctrine*] 3.12.18). Augustine’s theory of signs, based on 2 Corinthians 3:6, “For the letter killeth, but the spirit quickeneth,” insists that under the Christian dispensation signs refer to more than the things they signify—that is, they have a spiritual meaning (the “spirit”) beyond their literal sense (the “letter”).

In early Christianity a method of scriptural allegoresis according to four “levels” of meaning grew up. John Cassian (ca. 360–435) first formulated this fourfold system, although it is sometimes mistakenly credited to his more famous contemporary Augustine. The literal (or historical) sense referred to the ordinary sense of the text, while the three nonliteral levels expressed three distinct kinds of reference. The typological sense (in the Middle Ages called the allegorical sense) related the literal level to the life of Christ and to the church; the moral (or tropological) sense related it to moral behavior; and the anagogical sense related it to the consummation of Christian history at the end of the world, the study of which is called eschatology. The fourfold system was adapted to vernacular poetics by Dante in the “Letter to Can Grande,” where he explained the *Divine Comedy* through the four levels. Important as Dante is, neither his theory nor his allegorical practice appears to have influenced medieval English authors. But if the four levels were seldom if ever applied simultaneously as a compositional strategy, there is ample evidence of allegorical imagery in OE and ME literature.

Bede (ca. 673–735), in his *De schematibus et tropis* (*On Figures of Speech*), employed the fourfold system in distinguishing factual allegory from verbal allegory and in so doing helped shape the view, echoed by Aquinas (*Summa* 1.10), that God signifies the meaning of his creation not only in the prophetic words of the Bible but also in the things signified by the words. This view licensed the allegorical “reading” of the world as a book whose significations were recorded not only in biblical commentaries but also in bestiaries,

lapidaries, homilies, sermons and sermon source books, the liturgy, hymns, and encyclopedias—all rich sources of imagery for authors of sacred and secular literature (see Kaske, 1988).

The search for meaning in Creation led to allegorical interpretation even of colors, numbers, and words. Numbers can be symbolic in themselves (such as three for the Trinity) or can divide a work structurally (see Eckhardt, 1980; Reiss, 1970). The fives associated with the pentangle on Gawain's shield in *Sir Gawain and the Green Knight* present a numerical image of perfection. Colors can represent virtually anything, but color symbolism for spiritual concepts is perhaps the best-known type—e.g., white for innocence, or the Wife of Bath's notorious red hose (see Dronke). On the model of Jerome's *Liber interpretationis Hebraicorum nominum* (*The Interpretation of Hebrew Names*, ca. 400) and Isidore's great *Etymologiae* (ca. 615) words and names were analyzed etymologically for their concealed significance. The OE *Exodus* uses a name etymology from Jerome when it refers to Israel as the "right of God" (line 358b; see Robinson, Frank); Ælfric used etymologies to explicate scripture in his homilies (see Hill, 1988). In the later Middle Ages etymologies were gathered together with other allegorizations into collections called *distinctiones* ("distinctions"; see Barney, 1981), which analyzed words through their various significations. This method lies behind the various significances of bread in *Piers Plowman*, passus 13 and 14, and of the Virgin Mary in Chaucer's *Second Nun's Prologue* 29–84.

Modern criticism of medieval allegory can be said to begin with *The Allegory of Love*, C.S. Lewis's learned and engaging survey of literature influenced by the Latin tradition and by the "courtly love" tradition of the *Roman de la Rose*. In the next generation Rosemond Tuve surveyed medieval allegorical practice, showing the influence on Spenser's *Faerie Queene* of such traditional imagery as the vices and virtues and of such central texts as Guillaume de Deguileville's *Pilgrimage of the Life of Man*. D.W. Robertson, Jr., taking Augustine's *De doctrina christiana* as the key to reading medieval literature, applied the allegorical method of scriptural exegesis to secular literature in the belief that the medieval Christian context prompted secular authors to support the doctrines of the church in their writings. "Robertsonianism" or "exegesis" took any difficulty in the literal level as a cue to search for an implicit allegorical meaning that confirmed Christian doctrine. Although it was attacked for ignoring or even denying other considerations of critical analysis and for attributing the same essential interpretation to all works of medieval literature, Robertson's approach did establish that sacred and secular literature could employ the same modes of signification, and scholars now agree, largely due to the efforts of R.E. Kaske, that secular authors were familiar with ecclesiastical exegetical traditions. Kaske insisted

that allegoresis must complement philological and “New Critical” analysis (Kaske, 1963), and he developed a bibliographically supported method for tracing the sources of allegorical imagery (Kaske, 1988).

Other scholars have treated medieval allegory as part of allegorical literature as a whole. Angus Fletcher saw allegory as a “symbolic mode,” a general signifying process inherent in all art. Gay Clifford emphasized both the adaptability of allegory over time and such traditional features as conflict and opposition (e.g., in the quest), concreteness, and visual appeal in the representation of abstraction. Maureen Quilligan, arguing against Fletcher that allegory is a genre rather than a mode, insisted on reading allegories in light of each other in order to codify their stylistic and formal rules. However, in suggesting that language is allegory’s “first focus and ultimate subject” (15) because so many allegories use puns and other wordplay, Quilligan foreshadowed deconstructionist allegoresis, which questions whether a text’s various signifying strategies can lead to an unambiguous, objective (or “univocal”) meaning. Deconstruction considers interpretation a “hermeneutic circle,” arguing that as the reader closes in on allegorical “meaning,” it is revealed as yet another sign.

It must be noted, however, that theoretical descriptions of medieval allegory do not describe the practical procedures of medieval writers of allegory but rather modern perspectives on works composed by those writers. An historical analysis of medieval allegorical practice, such as Alastair Minnis has performed for medieval ideas of authorship, is still needed.

Allegorical Literature

The paradigms of allegorical narrative in the Middle Ages are set by biblical prophecies such as the book of Revelation and by a group of works from the 5th and 6th centuries. Prudentius’s *Psychomachia* (*The Spiritual Battle*) pitted personified virtues and vices against each other in a battle for the soul, which is figured allegorically both as the holy city Rome (via extended allusion to the *Aeneid*) and as the Heavenly Jerusalem (via extended use of biblical typology). The *Psychomachia* established personification as a central allegorical strategy. The allegorical interpretation of dreams has roots in biblical dreams such as Pharaoh’s in Genesis 41 and Nebuchadnezzar’s in Daniel 2 and 4, but Macrobius’s *Commentary on the Dream of Scipio*, a study of dream interpretation, provided a highly influential theory for later dream-vision narratives. Also important for later allegorists is Boethius’s *Consolation of Philosophy*, which introduced the theme of the allegorical dialogue between a

seeker and his spiritual guide.

Old English

It is clear from glossed manuscripts of Prudentius, King Alfred's translation of Boethius, Ælfric's homilies and prefaces to scripture, and scriptural and hagiographical poetry, such as *Christ I* and *Andreas*, that the allegorical practice of the Anglo-Saxon period is rooted in late Roman tradition and in insular and continental biblical exegesis. *The Dream of the Rood*, in which a dreamer speaks with the Cross, is the earliest extant use in English of the dream-vision form developed by Macrobius and Boethius. *The Phoenix*, partly inspired by the nature allegories of the 2nd-century bestiary *Physiologus*, provides its own exegesis, drawing correspondences between the phoenix and the followers of Christ, who build a nest for themselves in the tree of paradise by doing good works in this life. Another image has the just as warriors of God winning eternal life in the struggle against the enemy, death, and a third has them as the plants gathered by the bird, Christ, into its nest in the tree, heaven. Similarly indebted to *Physiologus* are *The Partridge*, *The Panther*, and *The Whale*. The image of the spiritual battle, indebted to the *Psychomachia*, occurs in other, ostensibly nonallegorical OE poems, most notably in Hrothgar's "sermon" about the dangers of pride in *Beowulf*. Allegorical interpretations of *The Wanderer* and *The Seafarer* as poems about exile from the heavenly home have been advanced on the basis of suspected echoes from scriptural exegesis.

Middle English

Allegorical practice in ME literature reflects religious, classical, and "courtly love" influences. Religious allegory entered directly via works written in English or translated from French or Latin for devotional, instructional, and preaching purposes. Prudentius's personifications are not far removed from works like the 14th-century *Abbey of the Holy Ghost*, a translation of the Old French *Abbaye du Saint Esprit*, which portrays the heart as the abbey of the Holy Spirit for those who cannot enter regular religious orders; prepared by the Four Daughters of God (Peace, Mercy, Righteousness, and Truth; cf. Vulgate Ps. 84:10–11), it becomes the residence of personified virtues. The allegory of the spiritual battle informs Robert Grosseteste's 13th-century *Chateau d'amour*, which was translated into ME several times and adapted

into other works, such as the historical poem *Cursor Mundi*. At the end of the Middle Ages the spiritual battle provides the structure for the Macro plays *Castle of Perseverance*, *Wisdom*, and *Mankind*, as well as for *Everyman*. The exemplum, a pithy and frequently allegorical narrative often used in sermons, lent itself well to religious and secular literature, as in Chaucer's *Pardoner's Tale* about three rioters who meet Death.

The classical mythographical tradition (e.g., allegorizations of Ovid's *Metamorphoses*) was the second major influence on ME allegory, particularly after the 12th century, as were such classical allegorical forms as the beast fable, which lies behind Chaucer's *Nun's Priest's Tale*. The third influence, the psychological allegory of love, came to ME via the French *Roman de la Rose*, which was a conduit for the Neoplatonic personification allegories of the 12th-century School of Chartres, for the allegorical treatments of love found in the "courtly love" lyrics of Provence and northern France, and for the dream-vision and dialogue genres deriving from Macrobius and Boethius.

Dream visions, debates, and dialogues were productive forms for allegory in ME. Like the biblical book of Revelation dream visions grant a transcendent view of existence. *Summer Sunday*, for example, presents an allegory about the devastations of Fortune. Dream visions are sometimes found "embedded" in larger narratives. Arthur's two prophetic dreams in the alliterative *Morte Arthure*, based on heraldic imagery and the allegory of Fortune's wheel, pinpoint his rise and fall as he marches through the Roman Empire. Chaucer's dream visions *The Book of the Duchess*, *The House of Fame*, and *The Parliament of Fowls* (also a debate) employ embedded allegorical murals, which derive ultimately from Virgil's description of Juno's temple in *Aeneid* 1.446ff. (cf. *Knight's Tale* 1914–2088).

The debate form is a natural vehicle for allegory because the participants, insofar as they represent fixed ideologies, are personifications: reason and sensuality, soul and body, *dives* and *pauper*, and even the birds in Chaucer's *Parliament*. Dream visions, whose truth claims suit the genre's inherited interest (from Macrobius and Boethius) in social, philosophical, and moral questions, frame many ME debates. The 14th-century alliterative poems *The Parliament of the Three Ages*, *Winner and Waster*, *Mum and the Sothsegger*, and *Death and Life* are closely akin to the earlier *Owl and the Nightingale* (ca. 1200) and to other debate poems.

Debates require figures of equal status; the dialogue requires figures in the roles of teacher and student. *Pearl* presents a dialogue within a dream-vision frame: in the frame a bereaved father dreams that he finds his deceased daughter in a setting drawn from the book of Revelation; when he challenges her ranking among the saved, she instructs him on the equality of the heavenly reward and leads him to where he sees her among the 144,000 virgins

in the company of the Celestial Lamb (Rev. 14), a figure for the Church Triumphant.

The dream-vision frame enclosing a debate or dialogue was the preferred allegorical strategy of Langland and Gower. Not easily classified because of its protean shape and encyclopedic range, Langland's *Piers Plowman* (ca. 1368–ca. 1385) pursues the quest of “Long Will” through eight visions, sometimes enfolding one dream within another and often employing debates among personifications—Lady Meed, Conscience, Clergy—who represent virtually every aspect of social, moral, and religious life. Gower wrote allegorical poems in each of the three literary languages of late-14th-century England. All three (*Mirour de l'Omme*, *Vox Clamantis*, and *Confessio Amantis*, the last in English) criticize London society and the Peasants' Revolt (1381) against the background allegory of man as microcosm, depicting the ravages of the seven deadly sins upon the soul undirected by reason and suggesting that reform in the body politic begins with reform in the individual. In the *Confessio* this disordered body politic is figured by Nebuchadnezzar's dream (see Dan. 4), and the personal and social agenda of reform is accomplished by a dialogue between an aging lover and Venus's minister Genius, who guides the lover through a spiritual crisis by means of a series of stories illustrating the seven sins.

Whether the ME secular lyrics were intended to be read allegorically has been debated. However, it is clear that preachers both allegorized secular lyrics in their sermons and used them as support for allegorizations of scripture. Some religious lyrics reflect allegorical themes, as in the debates between the body and soul, in which the soul, after death, rebukes the body for its sinfulness. This theme is found as early as the OE *Soul and Body I*, but except for *As I Lay on a Winter's Night* (*Index of ME Verse* 351), in almost all cases only the soul speaks. Other ME lyrics contain condensed allegories functioning as exempla: for example, “Wen the turuf is thi tuur” (*Index of ME Verse* 4044) warns the reader,

When the turf is your tower
and your grave is your bower,
your skin and your white throat
shall prosper worms.
Then what good will do you
all the world's bliss?

The lyrics are a mine of such stock allegories—the grave as a house, the wheel of Fortune, the dance of death, the four daughters of God, the three living and the three dead (a *memento mori* theme)—many of which correspond to iconographic images in stained-glass windows, on church walls, and so on. The

lines of such lyrics often resemble the *tituli* (or captions) that accompany visual renditions, called emblems, of the allegorical themes. Allegories also appear in occasional and political poems, as in the pageant of Nature, Grace, Fortune, Wisdom, and so on in Lydgate's coronation poem for Henry IV (*Index of ME Verse* 1398).

In general 15th-century allegorical usage continued earlier forms and practices, such as the psychological allegory, but in a conventional, imitative way. John Lydgate's *Complaint of a Lover's Life* and *Temple of Glass* follow the Chaucerian dream-vision model from *The House of Fame*, the former employing also a love allegory inspired by the *Roman de la Rose*. A dream vision leads the narrator on an allegorical pilgrimage to the Heavenly City in Lydgate's *Pilgrimage of the Life of Man*, a translation from the 14th-century French of Guillaume de Deguileville (see Wenzel, 1973). The Middle Scots poetry of the succeeding generation is often called Chaucerian for its adoption of Chaucer's "aureate" natural imagery (e.g., *Franklins Tale* 1245–55), much of which contains embedded allegories. *The Kingis Quair*, like Lydgate's *Temple of Glass* before it, leads a dreamer through a pageant of personifications and like *Pearl* suggests a fictional autobiography. Other dream visions give a distinctly Scottish coloring to the genre (Douglas, *The Palice of Honour*, Lindsay, *The Dream*), while yet other poems follow the general late-medieval trend toward emblemizing, using allegory mainly to illustrate preexisting concepts (Dunbar, *The Thrissill and the Rois*, *The Goldyn Targe*; anon., *King Hart*). Not until Spenser did allegory once again become a means of intellectual exploration.

Alliterative Revival

A poetic movement of the later 14th and 15th centuries, embracing a large number of poems written in various forms of the alliterative line, often unrhymed, but sometimes using rhyme as well as alliteration. At the center of the movement is a group of unrhymed alliterative poems of high literary quality and often of considerable length. Several present historical material: the life of Alexander the Great (*The Wars of Alexander*, *Alexander A*, *Alexander B*), Jewish history (*The Siege of Jerusalem*), the Troy story (*The Destruction of Troy*), and the last years of Arthur (*Morte Arthure*). There are poems based on Old Testament stories (*Cleanness* and *Patience*), romances (*William of Palerne* and *Sir Gawain and the Green Knight*), and poems presenting social, political, and ethical issues (*Winner and Waster*, *Piers Plowman*, *Richard the Redeless*, *Mum and the Sothsegger*), or raising questions of doctrine (*St. Erkenwald*). What defines the works as a group is their metrical practice, but the poems also share certain characteristic attitudes of high seriousness and moral gravity, as well as a fondness for passages of grand description of scenery and violent action.

The majority of the poems are anonymous and their dates uncertain: the earliest may be *William of Palerne*, written before the death of Humphrey de Bohun in 1361, though *Winner and Waster* is thought by many to have been composed in 1352 or thereabout. The allusion by Chaucer's Parson to the revival—"I am a southren man; I kan nat geeste rum ram ruf by lettre" (*Pars Prol* 42–43)—draws attention not only to the use of alliteration but also to its chief geographical location, for in Chaucer's time alliterative poetry had strong regional associations with the West Midlands, particularly the north of that area. In the 15th century the influence of alliterative verse was diffused more

widely, and many of its features were adopted by poets and dramatists in the north of England and in Scotland.

The question of the origins of the Revival has been much discussed but not satisfactorily resolved. The use of alliteration as a structural principle of a verse line is an ancient Germanic form, and it is natural to assume a link with pre-Conquest verse. Features of vocabulary also recall the poetic diction of Anglo-Saxon poets. However, as far as the written record goes, the classical form of OE verse died out soon after the Conquest, to be replaced by looser forms with irregular rhythmic and alliterative patterns, making irregular use of rhyme. The most distinguished example of this is Lazamon's *Brut*, a long chronicle of Britain composed by a priest from Areley Kings in Worcestershire in the late 12th or early 13th century. Other writers made irregular but often heavy use of alliteration in regular rhyming stanzas, and several fine examples of this are in the manuscript Harley 2253 (source of the Harley Lyrics), copied in about 1340 by a scribe from Ludlow, Shropshire, again in the Southwest Midlands.

Though Lazamon's *Brut* and some of the Harley Lyrics show interesting similarities with the poems of the Revival in their vocabulary and verse structure, both represent a divergence from the unrhymed alliterative line, most obviously in their use of rhyme. It used to be the general view that the unrhymed alliterative line survived in oral form from the Conquest to the mid-14th century, gradually adapting to linguistic and societal changes that reshaped both meter and thematic concerns. More recently objections have been raised to this idea, in particular that the sophisticated literariness of the poems of the Revival, many of which are based on (or even closely translated from) long texts in French and Latin, can owe nothing to an oral stage of transmission. It has instead been proposed that the written tradition was maintained by monastic authors and scribes in the West Midlands, but that all manuscripts of such earlier texts have been lost.

It is undeniable that losses of early ME texts must have been enormous, and it is likely enough that texts of a literary movement that was circumscribed both regionally and socially would not have been widely circulated, and yet it is difficult to understand how all trace of such poems could have vanished entirely. An alternative hypothesis is that the movement was a new creation of 14th-century poets, developed from a variety of preexisting forms—in particular, alliterative verse in rhyming stanzas and alliterative rhythmic prose, such as some of the 13th-century saints' lives and the works of Richard Rolle (d. 1349). However, the shared metrical practices of the poets are so deep-rooted, subtle, and apparently traditional that it is difficult to see how they could have been quickly assimilated and widely adopted.

Many poems of the Revival have presumably been lost, since the majority of those that remain, such as the *Gawain* poems, *Winner and Waster*, *St.*

Erkenwald, and *The Destruction of Troy*, are preserved in single copies. There are two manuscripts of parts of *The Parliament of the Three Ages* and *The Wars of Alexander*, *The Siege of Jerusalem* survives in the unusual number of eight copies and one fragment. Still more exceptional (as in many things) is *Piers Plowman*, with 52 manuscripts to its credit. Many of the manuscripts of alliterative poems are late, from the mid-15th century onward; *The Destruction of Troy* and *Alexander A* are preserved only in copies from the mid-16th century, and *Death and Life* in the 17th-century Percy Folio manuscript.

While works of Chaucer, Gower, and Lydgate are sometimes preserved in deluxe copies made for the aristocracy, manuscripts of alliterative poetry are humbler and less richly executed, suggesting ownership by a lower social class, probably including gentry and their households, as well as secular and monastic clergy. *William of Palerne* was written at the behest of Humphrey de Bohun, earl of Hereford, by a poet who names himself William, for the “ese of Englysch men,” specifically “hem that knowe no Frensche,” rather than for the entertainment of the patron himself. Another author for whom we have a name—but as yet no further information—is John Clerk of Whalley, Lancashire, who wrote the longest of all alliterative poems, *The Destruction of Troy*, for an unidentified knight.

Other conclusions about the nature of the authors and their audiences may tentatively be drawn from the characteristics of the poems themselves. Certainly many of the authors were highly educated and able to translate Latin and French easily and accurately, and they expected their audience to be attracted away from frivolous subjects toward a learned presentation of historical, social, and religious matters and also relied on them having an appreciation of the techniques of such arts as hawking, hunting, and siege warfare. The romantic and courtly attitude to love is notable by its absence; where love is a theme, as in *Gawain*, it features as a trap to catch the unwary rather than as a preoccupation to be indulged. A social setting that may be envisaged, but is as yet unsupported by any firm evidence, is of clerics writing for other clerics and provincial gentry. In an earlier generation this audience would have been prepared to read Anglo-Norman and Latin, but with the rise in the status of English after the mid-14th century they may have preferred writings in their mother tongue.

The concept of a sharply defined provincial audience is supported by the character of the vocabulary of alliterative poetry, which is distinctive and markedly different from that of poems by southern and eastern writers. Part of the difference is simply regional; the poets write in their own dialect using words confined to, or most common in, their own area. Such words may be found in nonalliterative northern and western texts and may survive in dialect to modern times: for example, *laik*, ‘play,’ a noun and verb of Old Norse origin,

common in northern dialects even today, widespread in northern texts including alliterative poems, but quite absent from the vocabulary of Chaucer and Gower. Another set of words is mainly confined to poets of the Revival, rarely occurring even in other northwestern texts: such a word is *blonk*, “horse” (from OE), common in alliterative poems. A notable group of synonyms frequently used in alliterative poems but never by Chaucer and Gower are the words for “man, knight”; of these *gome*, *burn*, and *lede* occur occasionally in nonalliterative poems, but *freke*, *hathel*, *shalke*, *segge*, and *wyze* (all from OE), and *tulk* (from Old Norse), are almost entirely confined to poems of the Revival at this period. With this vocabulary the poets build up a distinctive and varied poetic diction, used to particularly vivid effect in those descriptive scenes so characteristic of the school, of sea storms, savage battles, and mountain ranges.

The metrical structure of the alliterative line is essentially straightforward and may be illustrated by lines from *Gawain*. Each line is constructed of two half-lines of two stresses; the two stresses of the first half-line alliterate with the first stress of the second half-line:

On mony *bónkkes* ful *bróde* – *Brétayn* he *séttez*.

Consonants alliterate with identical consonants, and consonant groups, such as st- or sp-, often alliterate with themselves. Any vowel may alliterate with any other vowel or with h-:

Hit watz *Énnias* the *áthel* – and his *íghe* *kýnde*.

Some first half-lines have three prominent syllables, often with alliteration on all three (though these three prominent syllables may not all be stressed):

The *borȝ* *brittened* and *brent* – to *brondez* and *askez*.

Occasionally the last stress of the line joins in the alliteration:

Mist *muged* on the *mor* – *malt* on the *mountez*.

Other variations are found in the alliterative patterns, some of which are likely to be scribal errors. The rhythm is tightly controlled in the second half-line, so that certain patterns of regularly stressed and unstressed syllables (e.g., x/x/x or xx/xx) are avoided.

In several respects *Piers Plowman* is an uncharacteristic alliterative poem and an exception to what has been described, for Langland makes only limited use of the exclusively alliterative diction, and his line is longer and depends on

a modified set of metrical practices. The explanation is that he was writing for an audience that was socially more diverse and centered on a different region, and it is significant that *Piers Plowman* survives in many more manuscripts than any other alliterative poem, few of them northern. Strongly influenced by Langland in both style and subject matter is the author of *Pierce the Plowman's Creed*.

The alliterative line was also used for poems in rhyming stanzas. The most popular arrangement was a thirteen-line stanza of eight lines rhyming abababab followed by five shorter lines of various metrical and rhyming patterns—sometimes a one-stress “bob” preceding a “wheel” of four three-stress lines. Four particularly interesting thirteen-line-stanza poems are *A Pistel of Susan* (a retelling of the biblical story of Susannah and the Elders), *The Awntyrs off Arthure* (in which Guinevere meets her dead mother's ghost), *The Three Dead Kings* (an account unique in English of the motif of the meeting of the Three Living and the Three Dead), and *The Truelove* (a poem in praise of the Virgin Mary). In *Gawain* a stanzaic arrangement is produced by combining a variable number of unrhymed lines with the “bob-and-wheel”; in *Pearl* a modified alliterative line is used in intricate twelve-line stanzas.

During the 15th century the thirteen-line stanza became popular farther north and was used in drama (e.g., *The Castle of Perseverance*) and in Scottish poems (e.g., *Rauf Coilgear* and Holländ's *Buke of the Howlat*). The unrhymed line, too, survived later in Scotland than in England, and the finest late example is Dunbar's burlesque *Tretis of the Tua Mariit Wemen and the Wedo*, from the beginning of the 16th century.

Alms and Charity

The Gospels offered a compelling new impulse to the Judeo-Hellenistic world: love between people not bound by blood or kinship. Charity was thus a human expression of the love that bound God to humanity and was demonstrated in the sacrifice of the Son of God for their sins. The message of love that inspired the first Christians and that set itself as an antithesis to what was seen as a legalistic Jewish ethic elevated material poverty and weakness into signs of virtue and merit. Christianity inverted social hierarchies and relations to make a stranger into a brother, the poor and weak into lords of a world to come. As Christianity spread and became a mass religion, sanctioned by the Roman state and endowed with power and wealth, the tension inherent in this message became incorporated into the social structures of the Germanic peoples of western Europe and the romanized regions of southern Europe. Inasmuch as the church could maintain the force of the ideal of charity, this notion had to be harnessed to existing ideas and values.

The interpretation of charity that developed in medieval Christian society was thus dependent on context and embedded in prevailing ideas about family, social responsibility, community and cooperation, and formulations of sin, reward, penance, and punishment. From the 5th century papal legislation ordered charitable provision from bishops' incomes for the poor and for pilgrims, and throughout the early Middle Ages episcopal and then priestly office carried obligations of charity and hospitality. Charity was enjoined as an

ideal for religious communities and was practiced in ritualized forms at the gates of monastic institutions. It became an idiom for human perfection, its practice a mode for spiritual improvement. Almsgiving was integrated into the routines of penance as a form of satisfaction alongside fasts and prayers. It was a normative requirement preached in the homilies of Ælfric in the 10th century as in those of Thomas Brinton, bishop of Rochester, in the 14th century.

Discussions of charity and the development of new forms of charitable practice intensified in the high Middle Ages. With the increasing definition and clarity of the notion of purgatory charity was cast as a practice carrying important spiritual returns. Almsgiving and the grateful prayers of the poor could alleviate purgatorial suffering for venial sins for which a person had not done penance before death. In the heated debates of the 12th and 13th centuries new definitions of the contours of charity and the nature of charitable obligations developed. These called not for dispossession but for the sensible allocation of “superfluous” wealth toward the needs of the “involuntary” poor, as well as to the “voluntary” religious poor. English theologians formulated ideas to be implemented and enforced by bishops and priests. Primary obligations to support kin were coupled with gentle encouragement of charitable giving to the poor at the doorstep or in the hospital (as the hospital emerged as a general charitable institution).

As borough communities developed in the 12th and 13th centuries and became preoccupied with the promotion of order, safety, and hygiene, the religious language of charity was harnessed as a framework for the organization of relief. This convergence produced hundreds of hospitals and leper houses, from around 1150 onward, mainly served by religious communities, funded by charitable bequests.

In the 13th century a new type of charitable institution developed, the academic college, providing support for poor scholars in return for prayers and commemorations. Charity was also practiced in smaller frameworks, and for the benefit of family and friends, in the familiarity of parishes or the intimacy of a religious fraternity offering mutual help. In the countryside parishes collected and allocated funds that accompanied other community provisions to help the elderly, orphans, and the needy. In the 14th and 15th centuries a greater specialization in charitable giving is evident, with the development of charitable provision in parishes, as well as the secular almshouse or hospital, such as Whittington’s hospital in London, plus the numerous charities connected with craft guilds. Charity was thus experienced in medieval society as an omnipresent inducement toward participation in relief, help, and sociability, but the frequency and scope of these undertakings were left to personal discretion. It thus changed over time in its forms, intensity, and meaning.

Amesbury Psalter

The Amesbury Psalter (Oxford, All Souls College 6) is one of a group of five illuminated manuscripts (with another psalter, a missal, a Bible, and an Apocalypse) produced between ca. 1245 and 1255, which are important representatives of the early Gothic style in its maturity. Within ten years of their production the soft, deeply troughed drapery folds that are a feature of these works evolve into broader, more triangular fold forms under influence from France.

This psalter, “the purest gem of English medieval painting” (Holländer), has four exquisite full-page miniatures with burnished gold grounds, elaborately incised, prefacing the text. Within the psalter are large historiated initials at the ten major psalm divisions, as well as at Psalm 119 (the first of the Gradual Psalms). It has been demonstrated that the psalm initials are close iconographic copies of those in the early-13th-century Imola Psalter (Imola, Biblioteca Comunale 100), associated with Amesbury in Wiltshire, having in common biblical themes, such as Samuel anointing David (Ps. 26), the

Fig. 2. Amesbury Psalter (Oxford, All Souls College 6), fol. 2. Virgin and Child (Virgo lactans). Courtesy of the Warden and Fellows of All Souls College, Oxford.

Judgment of Solomon (Ps. 38), Doeg slaughtering Ahimelech and the priests (Ps. 51), the Temptation of Christ (Ps. 52), Jonah being cast into the whale (Ps. 68), Jacob wrestling with the angel and Jacob's dream (Ps. 80), and the

Annunciation to the Shepherds (Ps. 97). The series is thus of a type that predated French influence and tended to illustrate the literal content or opening verses of the psalm (cf. Cuerden Psalter [New York, Pierpont Morgan Library M.756]).

The full-page miniatures, depicting the Annunciation, Virgin and Child (fig. 2), Crucifixion, and Christ in Majesty, relate closely to those in the Missal of Henry of Chichester (Manchester, John Rylands Library lat. 24), where some of the subjects are the same. This style, in which sincere feelings of tenderness, compassion, and devotion are expressed in the faces, is characterized by strong drapery lines and monumental figure types. The artist uses white hatching for highlights and brown tones for facial modeling. These dignified figures are, however, beginning to show signs of a graceful mannerism associated with the products of the Court School, which is seen fully developed in Queen Mary's Psalter of the early 14th century (BL Royal 2.B.vii).

There is no precise dating evidence for either the psalter or the missal, but the related Bible (BL Royal 1.B.xii) has an inscription that records that it was written by William of Hales in 1254. It is a matter of conjecture as to whether the psalter pre- or postdates the missal, although Morgan has pointed out that the draperies in the psalter show greater naturalism and refinement than do those in the missal and that they are developing toward the more softly flowing forms evident in the Paris Apocalypse (Paris, BN fr. 403) of ca. 1250–55, which he assigns to the Sarum Master. Whereas it could be argued that the greater vigor of expression and dramatic gesture in the missal might suggest that it postdates the psalter, Morgan also notes that certain pigments apparent in the psalter, but not in the missal, occur in the Bible, which is presumably of later date.

The sources of this exceptional illuminator (the "Sarum Master"), whose identity is unknown, derive ultimately from the milieu of two London-produced books: the Westminster Psalter (BL Royal 2.A.xxii) of ca. 1200 and the Glazier Psalter (New York, Pierpont Morgan Library Glazier 25) of ca. 1220. The style also bears a relationship to the wall paintings in the Chapel of the Guardian Angels at Winchester of ca. 1230 and the Chichester Roundel of ca. 1250–60. It is undoubtedly related to other monumental works of painting and sculpture, but the severe losses in the Salisbury area make a comprehensive assessment of this Master's origins impossible. The prerestoration drawings of medallions on the ceiling of Salisbury Cathedral suggest parallels with his style. In this case contemporary foreign survivals can throw much-needed light on the problem. For instance, the Amesbury Psalter miniatures have a number of unusual iconographic features for which parallels have been found in more completely preserved German wood sculpture and Norwegian panel painting, the latter under stylistic as well as iconographic influence from England. The

interesting iconic representation of the *Virgo lactans* (the Virgin suckling the Child), which becomes popular in England at this time (there are instances in wall painting), is not necessarily of foreign origin and could have evolved from narrative representations of this image in earlier English illumination.

The evidence of the Sarum illuminator's *oeuvre* indisputably localizes production to the Salisbury area. The calendar of the Amesbury Psalter contains two prominent feasts of St. Melor, whose relics were at Amesbury. As to ownership, both the Virgin and Child and Christ in Majesty pages show a nun kneeling in prayer. It has recently been argued that her identification as a Benedictine nun of the order of Fontevrault, which had a convent at Amesbury, should be viewed with caution, since the calendar is not properly one of that house, and that the patron could well be a laywoman, possibly a widow.

Anarchy

The name applied to Stephen's reign (1135–54). Though the Anarchy was actually a civil war, the idea that England lacked a central government during these years began with contemporary chroniclers and has been accepted since Tudor times.

A disputed claim to the throne started the Anarchy. After Henry I's son died in 1120, he designated his only legitimate child, Empress Matilda, widow of the

Holy Roman Emperor Henry V, as his heir; the barons swore homage to her in 1126. However, in Norman history no woman had been a ruler, and Matilda was also married now to a traditional Norman enemy, Geoffrey, count of Anjou. When Henry I died (1 December 1135), many English barons were hesitant to accept her, and Henry's nephew Stephen of Blois acted quickly.

Stephen's hereditary claim was weak, but he was known to the English nobles and Henry had enriched and greatly favored him. He was acclaimed king by the people of London and Winchester and given control of the government after his brother Henry, bishop of Winchester, convinced key administrators to accept him. He was formally crowned on 22 December 1135. At first Stephen had strong support. His Charter of Liberties (1136) won over the English clergy, and by summer most of the nobles officially recognized him. Despite the lack of formal election, designation, or inheritance he appeared to be undisputed king of England.

The consensus did not last; war began in 1137. Matilda's forces held Normandy, but in England her troops, led by her family (especially her uncle, David, king of Scots, and her half-brother, Robert, earl of Gloucester), were defeated by Stephen's at the Battle of the Standard (1138). Yet this victory neither stabilized his rule nor ended the fighting. Rivalries proliferated at court, exacerbated by clerical disputes that alienated even the king's brother. Stephen's attempts to replace government personnel were often clumsy and offensive. Nobles switched sides at crucial times, sometimes repeatedly. Castles were built and land subinfeudated (vassals bestowing land upon their own vassals) without royal permission. In February 1141 Stephen was captured at the Battle of Lincoln and the empress was declared "Lady of England." In spite of heavy defections from Stephen's camp Matilda failed to keep power. A poorly handled clerical appointment made her appear an opponent to reform in the church. Londoners rebelled after she demanded financial support. Some of Stephen's former followers wanted rewards or power greater than she was willing to give. Furthermore some barons were unable to reconcile their own expectations of a woman's behavior with a king's behavior, unable to accept a woman who actually ruled.

Stephen's wife, Queen Matilda, continued the fight. After nine months Stephen resumed the crown when Robert of Gloucester was captured and their wives negotiated a hostage exchange. While Stephen gained the advantage in the field, he never recovered active noble support, relying on mercenary troops, and Matilda even remained in England until 1148. There was little progress until 1150, when Empress Matilda's son Henry (Plantagenet) assumed control of their forces. In 1153, faced with the increasing wealth and skill of Henry and the death of many of his original partisans and old enemies, Stephen accepted a negotiated peace. Emphasis was placed on the hereditary

nature of the monarchy; Stephen “adopted” Henry as his “son and heir” in a public oath, passing over his own son. Royal power was reasserted as unlicensed castles were razed and all castles were to be turned over to Henry at Stephen’s death. When Stephen died on 25 October 1154, Henry was in Normandy. Certain of a peaceful transfer of power, he did not come to England to assume control, as Henry II, until December.

The causes and results of the civil war are debated. The nobles’ willingness to participate, much less to switch sides, may have been a feudal reaction against the centralized government of Henry I or evidence that they accepted strong rule and searched for a king stronger than Stephen. A few were merely opportunistic, the classic example being Geoffrey de Mandeville, whose double-switch was crucial to the events of 1141 and whose cruelty and pillaging were part of his normal behavior until his death, an excommunicated rebel, in 1144. Many chose sides because of the ability of the claimant, or to regain land lost under Henry I, or because a rival in a local dispute chose the other side. Disappointment in the ability or success of both claimants explains most defections. The actual extent of the Anarchy—as measured by administrative continuity or breakdown and the damage caused by military campaigns—is still a matter of debate.

Ancrene Wisse

An anonymous religious guide for anchoresses (ca. 1215–22). The work, first written at the request of three female recluses, was later revised for larger audiences of both men and women. English is believed to be its original language, although versions of it also exist in Latin and French. The oldest manuscript is BL Cotton Nero A.xiv, but Cambridge, Corpus Christi College (CCCC) 402, is believed to be the closest to the original. The work proliferated, yielding other versions in the 13th, 14th, and 15th centuries. Dobson localizes it to Wigmore Abbey in Herefordshire and possibly to the anchorhold of the Deerfold, where three anchoresses lived.

Tolkien has shown conclusively that the *Ancrene Wisse* is associated with five other ME religious works known as the Katherine Group; the prayers and meditations known as the Wooing Group are also closely related. The Katherine Group and the *Wisse* together are known as the AB texts, manuscript A standing for the West Midlands dialect of the *Ancrene Wisse* as it appears in CCCC 402 and B for the Katherine Group as it appears in the manuscript Bodley 34. The author of the *Wisse* is unknown, although he was most likely an Augustinian canon.

The three recluses for whom the *Wisse* was written are not named but are addressed as sisters within the work itself. In the Cotton Nero manuscript they are addressed as natural sisters and called well-born. Like other anchoresses they were committed to vows of obedience, chastity, and stability and were to live as if “dead to the world.” From the work we know that these three were devout and lived comfortably in an anchorhold that consisted of bedrooms, servants’ quarters, and a garden.

The title *Ancrene Wisse* (*Guide for Anchoresses*) appears as a rubric on fol. 1 of CCCC 402, but the work is also referred to as the *Ancrene Riwe* (*Rule for Anchoresses*). The name *Wisse* is more appropriate for the spirit of the work, for the author tells us throughout that he is concerned not with external rules but with the less definable rule of the heart. The *Wisse*’s vocabulary, syntax, and idiom have features in common with OE homiletic prose, but it also displays stylistic innovations for which it is justly praised as a masterpiece of early ME literature. It draws heavily on the work’s of Bernard of Clairvaux, Aelred of Rievaulx, Anselm of Canterbury, and Augustine but depends most

on the Bible.

Georgianna has shown the importance of the *Wisse* as a measure and product of the 12th-century renaissance, that is, as a sophisticated psychological work concerned with the nature of the individual in society and with the recording and investigation of personal history. Grayson has shown the importance of the work's rich and complex patterns of imagery, which she describes as nonlogical, nonteleological ascending and descending spirals. Robertson argues that the work's theme, imagery, and structure, including the patterns outlined by Grayson, are shaped by the author's paternalistic and patriarchal notions of the nature of its female readers.

The *Ancrene Wisse* is divided into eight parts, two outer rules that frame the work (devotions and daily rules) and six inner rules (custody of the senses, regulation of inward feelings, temptations, confession, penance, love), all aimed at motivating and supporting the anchoress's devotion to Christ as her chosen beloved. Although union with Christ is celebrated, the work focuses more on the psychological difficulty and importance of balancing an abstract religious ideal with the demands of quotidian reality in the anchorhold. The *Wisse* conveys its message in part through its complex imagery, ranging from the chivalric topos of Christ as knightly lover to the everyday one of the sparrow outside the window. The work is one of the most sophisticated pieces of early ME devotional prose. Its blending of lyric intensity, affective piety, and homiletic purpose ultimately extended its appeal far beyond its original narrow audience.

Andreas

An OE narrative poem of some 1,722 lines based on an apocryphal life of St. Andrew. Probably written in the 9th century, the poem is generally believed to be a translation of a lost Latin work that was itself ultimately derived from a text similar to a 4th-century romantic Greek legend, *The Acts of Andrew and Matthew in the City of the Anthropophagi*. This work, in turn, was part of a much larger popular tradition begun at least as early as the 2nd century that imaginatively explored the fates of the apostles after Jesus commanded them to spread his teachings throughout the world (Matt. 28:19–20; Acts 1:8). The author of *Andreas* fuses this fabulous tale with the conventions of the OE Germanic-heroic poetic tradition, depicting the saint as an OE warrior who leads his loyal thegns into battle against the opposing armies of the Devil and the Anthropophagi, who are themselves fierce but unhappy hall-thegns. This

merger of traditions is not always successful, but *Andreas* is nevertheless a lively and engaging testament of faith.

The poem's heroic opening praises the twelve apostles and tells of Matthew's trials among cannibals in Mermedonia (possibly Scythia), where he is blinded and imprisoned. God commands Andreas to rescue Matthew, and he sails from Achaia to Mermedonia on a ship piloted by a Helmsman and two sailors, who are Christ and angels in disguise. The stormy voyage continues for nearly 500 lines, during which Andreas recounts to the Helmsman the miracles of Christ among the unbelieving multitudes and his attempts to convert the high priests in the temple in Jerusalem. Although the Helmsman offers to put Andreas's thegns safely ashore during the storm, they protest their loyalty to Andreas in a speech that articulates the ethos of the Germanic *comitatus*, the traditional aristocratic warrior band. Andreas reassures his followers by telling of God's power to calm the raging seas. The thegns fall asleep, and the seas grow still. Having praised Christ's teachings for the whole day, Andreas, too, suddenly falls asleep, and he and his followers are borne aloft by angels and left sleeping outside the walls of Mermedonia. Upon awakening Andreas realizes the identity of the Helmsman.

The remainder of the poem concerns Andrew's confrontations with and conversion of the Mermedonians. Made invisible by God, he rescues Matthew and other prisoners. At God's command Andreas reveals himself and is taken captive by the enraged and starving enemy. For three days he suffers—tortured by day and taunted at night by the Devil. On the third day he prays to God for mercy and sees flowers bloom where his blood once flowed upon the earth. God heals Andreas, who then commands a marble pillar to flood the city, while an angel covers the fortress with flames so that none may escape. As many drown, others repent and Andreas leaves his prison, the ground becoming dry wherever he steps. He prays that the dead may be restored to life and his prayers are answered. A Christian church is built, the Mermedonians are baptized, a bishop is named. Andreas then sails once more to Achaia, while the newly converted Mermedonians sing a hymn to the glory of God.

The unique copy of *Andreas* survives in the late-10th-century Vercelli Book. Two OE prose versions are extant as well: a fragment in the late-10th-century Blickling Manuscript (Homily XIX) and a complete version in the early-11th-century manuscript Cambridge, Corpus Christi College 198. Because *Andreas* is followed in the Vercelli Book by *The Fates of the Apostles*, a short poem containing Cynewulf's runic signature, both poems were once thought to be a single work by that author. Scholars have since disproven Cynewulf's authorship of *Andreas* and have established its independence from *The Fates of the Apostles*. Other scholars, noting its many verbal and thematic

similarities to *Beowulf* and other OE poems, have argued that the *Andreas*-poet was indebted to *Beowulf*.

Angel Roofs

Roughly contemporary with the development of the Perpendicular style in architecture was the development of the wooden “hammer-beam” truss (a horizontal timber cantilevered out from the wall to help support the roof truss). In the late 14th and 15th centuries carved angels were added to the ends of the hammer beams. While usually carved separately, there are instances in which the body of the angel is carved from the beam itself and only the wings worked separately, as in the parish church of Mildenhall, Suffolk. The roofs

were particularly popular in East Anglian churches of the 15th century.

Both the hammer beam and the use of angels for decorating vaults appear early in the 14th century. In the east end of the Gloucester Cathedral choir the roof bosses above the altar are decorated with angels carrying musical instruments and the symbols of the Passion. The two seem to come together for the first time in Hugh Herland's timber roof in Westminster Hall (1394–1400). Here single rows of angels bearing shields of the king's arms project from the ends of the brackets. The roof is remarkable not only for the exquisite quality of its carvings but also for its enormous span of over 65 feet.

Hugh Herland, the king's master carpenter, enjoyed the same high status and privileges as a master mason. Both his position and the esteem in which his work was held are symptomatic of the increased demand for high-quality woodwork in England in the late Gothic period.

While angels carrying the arms of noble families do appear, angels bearing musical instruments or symbols of the Passion are more common. Musician angels in general can be understood to symbolize heavenly harmony, and their music echoes that of the congregation below. The composition of the angel roofs may often have had close ties to the liturgy and liturgical drama, as at All Saints Church, North Street, York, where the angel Gabriel faces Mary above the altar in the chancel.

By the late 15th century magnificent double-hammer-beamed roofs decorated with tiers of soaring angels were created. At March Church, Cambridgeshire (ca. 1500), two tiers of angels project from the roof beams and a third from the base of the roof posts (fig. 3). The roof of the church at Upwell, Norfolk, however, reminds us that not all was harmony, beauty, and grace. Here, beneath the outspread wings of an angel, a fuzzy-haired human is being devoured by monsters.

Angelus ad virginem

A devotional Latin strophic song of the first half of the 13th century in five stanzas on the Annunciation of Mary. There is memorable testimony to its widespread popularity and longevity in England in a passage from the *Miller's Tale* introducing Chaucer's poor Oxford scholar "hende Nicholas," who sings *Angelus* in his lodging to the accompaniment of his psaltery:

And al above ther lay a gay sautrie,
On which he made a-nyghtes melodie
So swetely that all the chambre rong;
And *Angelus ad virginem* he song. (*MilT* 3213–16)

Most sources and references to *Angelus ad virginem* are insular (complete report in Stevens). One tuneful melody is transmitted in four English sources, twice monophonically and twice in polyphonic settings of the later 13th and mid-14th centuries; an entirely different melody survives uniquely in a 15th-

century German source. *Angelus* was twice translated into English, once anonymously in the later 13th century (“Gabriel fram evene king,” underlaid beneath the standard melody and Latin text in BL Arundel 248) and again in the early 15th century by John Audelay (“The angel to the vergyn said,” without music, in Bodl. Douce 302). In a reference recently discovered by Page in the anonymous 13th-century English *Speculum laicorum* Odo of Cheriton is said to attribute the authorship of *Angelus* to Philip, the chancellor of the University of Paris (ca. 1160–1236). If this is to be credited, then perhaps it was brought to England in the first half of the century by the mendicant friars. Much later in its career *Angelus* was “taken over by liturgical officialdom” (Stevens), appearing, for example, in the ordinal of St. Mary’s, York, of ca. 1400 and in 16th-century missals of Cluny and Senlis as an Advent sequence for masses of the Virgin.

Angevin Empire

Modern historians commonly use this term for the vast collection of French and English lands ruled by descendants of the counts of Anjou in western France in the later 12th and early 13th centuries; contemporaries never called it an empire nor its ruler an emperor. During its heyday in the later 12th century it was one of the great territorial powers of Europe; its rulers, especially Henry II, were leading men of their day. Although relatively short-lived and a failure from the perspective of its attempt to unite a large part of Britain and France as a permanent territorial unit, it had lasting effects on its constituent parts, particularly England. It was a remarkable creation in that no one could have predicted its existence even a few years before it began.

Accidents of royal and princely succession played a decisive role in its origins. The Plantagenet family, the dynastic rulers of the Angevin Empire, traced its origins to late-9th-century ancestors who became viscounts, then counts of Anjou, lying mainly north of the Loire, east of Brittany. Their growing power brought them into bitter rivalry with the other major principality of the northwest, the duchy of Normandy. A dynastic marriage in 1128 brought these ruling families together and enabled the Plantagenets to succeed to the English throne in 1154. Lacking a male heir, Henry I of England arranged for the marriage of his daughter Matilda, widow of the Holy Roman Emperor Henry V, to Geoffrey, the fourteen-year-old heir of Fulk V of Anjou.

They failed to make good their claim to the English throne, but the death of Stephen's male heir in 1153 reopened the question of the English succession. By now Geoffrey was dead (1151), but his eldest son, Henry Plantagenet, born 1133, pressed his claims and gained recognition in 1153 as successor to the English throne on Stephen's death (October 1154). When Henry ascended the throne, he brought together not only the kingdom of England, his native county of Anjou with its appendages, and the duchy of Normandy, conquered by his parents in 1144, but also the huge southwestern French duchy of Aquitaine, which he had acquired by his marriage in 1152 with Eleanor, duchess and heiress of Aquitaine.

In subsequent years Henry II conquered or subjected to his authority Wales, Ireland, Scotland, and Brittany, so that, at its greatest extent, late in his life, the Angevin Empire included most of Britain and western France to the Pyrenees. He presided over the establishment and operation of a system of governmental officials and institutions that administered his far-flung lands. In England this contributed to the elaboration of common law and administrative practice. The Angevin period in England also witnessed heightened activity in education, writing (literary and historical), and the arts, especially architecture and

manuscript illumination. Despite the blemish left by the murder of Thomas Becket this was a great period in the history of the English church, both secular and regular (monastic).

Since it did not collapse at once, it is difficult to assign a precise date for the end of the Angevin Empire. From its beginnings the Capetian kings of France had been its enemies, but both Henry II and his son Richard I held them firmly in check. Their successor, Richards brother John, failed to do so. Using a dispute with a nobleman of Poitou as a pretext, Philip II of France formally confiscated John's French fiefs and then proceeded to conquer Normandy. Though revolts of Aquitanian nobles, kindled by French success, deprived John of these lands, one modern view holds that it was the loss of La Rochelle in 1224 that marked a decisive end to Angevin rule in Aquitaine. Plantagenet kings of the 13th century continued to rule fragments of their former domains in France, but the loss of the bulk of the land gradually transformed the empire from one based primarily in France to one centered in England. At this point, it is argued, the Angevin Empire had ceased effectively to exist.

Anglo-Latin Literature after 1066

During the four centuries following the Norman Conquest Anglo-Latin literature continued to evolve and expand, seeming at first to blend so successfully into the landscape of European Latin literature as to be almost indistinguishable. It reemerged with a sharper profile in the 13th century and

disappeared as a separate literary entity only by the middle of the 15th century, with the rise of humanism and the ascendancy of English. Much of this change was adaptation to political circumstances. The establishment of the Anglo-Angevin Empire under Henry II brought with it the height of Anglo-Latin's "europeanization" (the roots of this development go back to the 11th, possibly even late 10th, century) and its hearty participation in the 12th-century renaissance. The loss of Normandy in 1205 caused Anglo-Latin literature to become a good deal more inward-looking and insular, almost xenophobic.

Cultural shifts were just as significant. The development of popular preaching, and the ousting of French by English as the language of court and administration in the 14th century, contributed to the decline of Latin as the literary vehicle of first choice. Other influences included the early-13th-century foundation and subsequent swift spread of the mendicant orders, the Franciscans and Dominicans. With their strong emphasis on scholarship and preaching, combined with freedom of operation, they contributed to the rise of the universities in England. Notable Franciscan authors were John of Wales, Walter of Wimborne, and John Pecham. The friars in their turn became the subject of satire, as the monks had been before them.

During the same period the increased popularity of private devotion and meditation brought about a change in the focus of religious literature, away from the simple recounting of salvation history, retelling Old and New Testament stories, toward a more intensely contemplative and sentimental viewpoint: not so much scanning the long train of events in the life of man culminating in Christ crucified and risen again but gazing with heightened emotion upon the suckling infant who is at the same time the suffering Savior on the Cross of agony. This trend was prefigured in the devotional and pastoral writings of the Cistercian Aelred of Rievaulx and reached a high point in the poetry of John of Howden and Walter of Wimborne and in the contemplative works of Richard Rolle.

Another evolutionary trend was a gradual change in the circumstances of literary production. The monasteries had always been the principal centers of Anglo-Latin scholarship, and although they continued to contribute in a major way, by the early 13th century a good proportion of Anglo-Latin writers were secular clerics, holding ecclesiastical offices but decidedly in the thick of political life, like John of Salisbury (whose *Policraticus* explores the morality of politics), or attached to the royal court as justices, secretaries, or chaplains. Of the latter type was Walter Map, who satirized the royal court in his *De nugis curialium*.

A facet of England's close relationship with France was the powerful pull of the renowned teachers at Paris. Talented scholars returning to England then

found a place to bring their learning to bear on the world by involvement in the swiftly developing government and amid a welter of administrative activity. Furthermore, in the later 12th century, Oxford gained preeminence, and England finally had its own Paris. Cambridge followed close behind. All these places fostered and brought forth scholars and writers of Anglo-Latin. The rediscovery and teaching of Aristotle's works at Oxford had a profound influence on thinking and writing in England. In the 14th century the grammar schools also began to provide new arenas for Latin scholarship. A mark of the general shift of balance is the fact that John Gower, the last major figure in medieval literature to write in Latin and French as well as English, may not have been in holy orders at all.

During the course of four centuries Anglo-Latin authors composed works in almost every literary genre and on a broader range of topics than ever before, as well as continuing with the fundamental activities of letter and sermon writing, biblical exegesis, and, from the 12th century onward especially, ever-widening theological, philosophical, and scientific speculation.

The second half of the 11th century saw an unprecedented burst of activity in the field of hagiography, and many Anglo-Saxon saints seem to have been commemorated in writing for the first time; Goscelin and Folcard, both of St. Bertin, were the most industrious, closely followed by Osbern and Eadmer working at Canterbury, and later Dominic of Evesham. Much hagiography survives from the period that cannot be ascribed to any named author. Once revived, hagiography never died out in Anglo-Latin; lives were written by Osbert of Clare, Jocelin of Furness, Aelred of Rievaulx, Lawrence of Durham, Senatus of Worcester, Gerald of Wales, and Matthew Paris, to name only the best known, and the cult of Thomas Becket alone generated a vast amount of material.

Hagiographic style evolved across the period. During the 12th century a formal, Rome-centric system of rigorously controlled canonization was established. Carefully authenticated dossiers were required, and this meant the production of ever-longer lists of miracles, in which the names of witnesses began to be included; examples are the 102 miracles of St. Frideswide written down by Philip the Prior; the miracles of Godric of Finchale, recorded in over 250 chapters by Reginald of Coldingham; and the dossier on Gilbert of Sempringham. Verse saints' lives became popular in the 12th century: for example, Gregory of Ely's life of Æthelthryth in leonine hexameters and the anonymous lives of Katherine, Ælfheah, and Hild. Nigel Whiteacre wrote 2,345 rhymed hexameters on St. Lawrence, and a shorter poem on Paul of Thebes, and in the 13th century Henry of Avranches versified the lives of Crispin and Crispinian, Francis, Oswald, Birinus, Guthlac, Edmund, Freomund, Hugh of Lincoln, and Thomas Becket. In the 14th century, as part of a general trend

toward the assembling and summarizing of knowledge, John of Tynemouth made his *Sanctilogium*, the largest surviving compilation of the lives of the saints of the British Isles, all carefully abbreviated and put in calendrical order, interspersed with brief moral tales. Similar activity is represented by two other national collections of abbreviated saints' lives, one in the British Library in London (Lansdowne 436) and one at Gotha (Forschungsbibliothek 1.81).

The growth of popular preaching fostered the genre of exemplum collections, a sort of precursor to anthologies of short stories, in which were assembled any number of anecdotes, moral tales, and visions of the afterlife, from literary or oral sources, for the use of the preacher. Visions of the otherworld continued as a distinct literary genre, examples of which are Henry of Saltrey's *Purgatorium sancti Patricii* and the Vision of Thurkill.

After a long time of relative reticence writers in the 12th century began to take up the cause of England's history and national identity, just as the 11th-century hagiographers had already begun to dust off the Anglo-Saxon saints. Eadmer wrote on contemporary events; William of Malmesbury continued in the tradition of Bede as ecclesiastical historian but also concerned himself with secular events in his *Gesta regum*. Henry of Huntingdon adorned his history with short poems, mainly his own (sometimes, interestingly, attempting to reproduce the rhythms of OE verse), Geoffrey of Monmouth wrote his profoundly influential version of events in pre-Saxon Britain (*Historia regum Britanniae*), and Richard of Devises chronicled the reign of Richard I. The tradition continued into the 13th century with Matthew Paris. Local history was as much a concern as world events: William of Malmesbury wrote on Glastonbury Abbey, Matthew Paris on the abbots of St. Albans, Jocelin of Brakelond on Bury St. Edmunds, Hugh Candidus on Peterborough, and Hugh the Chanter on York.

Every kind of poetry was attempted by post-Conquest Anglo-Latin writers. Examples of epic are Reginald of Durham's verse life of Malchus, Joseph of Exeter's *Antiocheis* and *Ylias*, Lawrence of Durham's *Hypognosticon*, and John of Garland's *De triumphis ecclesiae* on the Crusades and his *Epithalamium beatae virginis*. In the late 11th century Godfrey of Cambrai composed 238 epigrams, after the style of Martial, on historical figures. Poetry achieved a pitch of artistry and skill in the 13th century, with Michael of Cornwall and Henry of Avranches, who developed a vigorous polemic style that informed the large amount of political poetry written thereafter, much of it anonymous. Subjects included the Crusades, the capture of Richard I, the papal interdict of 1208–14, the Barons' War, the Gaveston affair. Subjects for satire were wide-ranging: monks, gluttony, and ecclesiastical abuses, then friars and crusading orders. The end of the period saw a rising tide of anticlericalism, which came hand in hand with Lollardy and the teachings of Wyclif.

Poetry throughout these years was predominantly quantitative (hexameters and elegiacs), both rhymed and unrhymed, but rhythmical, stanzaic poetry also increased greatly in popularity. About halfway through the period emphasis seemed to fall more heavily upon rhyme, which was used in increasingly complicated schemes, while unrhymed forms of the quantitative dactylic verse were abandoned until much later. Quantitative lyric meters modeled on Horace were little used except by Goscelin, Reginald of Canterbury, and Henry of Huntingdon. In this earlier period the prosimetrum was also developed, integrating prose and verse on the models of Boethius and Martianus Capella. Examples are the life of Edward the Confessor, Goscelin's life of St. Eadgyth, and Lawrence of Durham's *Consolatio de morte amici*, then somewhat later on Elias of Thriplow's *Serium senectutis* (13th century).

Grammatical and lexical aids continued to be important, and there are notable examples from all centuries: Osbern Pinnock's *Panormia*, an influential list of lexical derivatives; Alexander Neckham's *De nominibus utensilium* and *Corrogationes Promethei*, various works by John of Garland, and John Seward's writings on poetry.

As the post-Conquest period passed by, Anglo-Latin was written with more confident liberty from the constraints of classical norms. Increased day-to-day use of Latin in combination with a stress upon dialectic in the context of the universities gave rise to a certain freedom of coinage, but also a tendency toward the infiltration of vernacular words and idioms, even syntax, into written Anglo-Latin. The literature of the 13th and 14th centuries may be characterized by a liking for heavy alliteration, odd vocabulary, and a pedantic tone that to some extent reverberates with the so-called hermeneutic style affected so ostentatiously by the confident, continentalizing churchmen of the late 10th century. At the same time authors enthusiastically took up wordplay and verbal-visual trickery that went beyond established modes of rhetorical embellishment. But there seems, in a way, to have been a tug-of-war, for toward the end of our period interest in Anglo-Latin became more and more academic and analytical: literary histories (such as Thomas of Walsingham's *Prohemia poetarum*), library catalogues, commentaries and anthologies, Anglo-Latin for Anglo-Latin's sake, rather than as a natural, casual literary vehicle. In the later 14th century there was also a distinct group of scholars, the so-called "classicizing friars," among them Nicholas Trevet and Robert Holcot, who peppered their preaching with classical allusion and "moralized" pagan tales. This was an early sign of the reawakening interest in classical antiquity, which eventually brought with it a return to the strict norms of classical Latin, heralding the era of humanism and of a different and perhaps less vital and multicolored creature, Neo-Latin.

Anglo-Latin Literature to 1066

Evidence for transmission of Latin literary culture from classical and Christian antiquity survives in works by the Britons Pelagius, Patrick, and Faustus of Riez from the 5th century, Gildas from the 6th, and Moucan from the 7th or early 8th. Among the Irish abroad, like Columban, and at home, like Cummiánus Longus, Colmán, Augustinus Hibernicus, Laithcenn MacBaíth, Virgilius Maro Grammaticus, Aileranus Sapiens, Tirechán, Cogitosus, Muirchú Moccu Maithéni, and Adomnán, the 7th century saw a burst of creative literary activity unparalleled elsewhere in Europe. The extant Latin of all the Britons, even those like Patrick, misprised by modern scholars, is correct, polished, and brilliantly structured. References by Columban to Gildas and by Cummián to Patrick show that the British tradition had been assimilated and naturalized at the very beginning of the Irish tradition.

Anglo-Saxons might have encountered Latin literary culture upon exposure to Britons whom they dispossessed and dominated from the 5th century, to Irish missionaries from Columban's foundation at Iona after 563, or to Roman missionaries sent with Augustine by Pope Gregory the Great to Canterbury in 596. However, the earliest extant monuments of Anglo-Latin literature derive from the second half of the 7th century in direct and sustained response to the efforts of three men. Theodore of Tarsus arrived as bishop of Canterbury in 669 and Hadrian the African as abbot of Sts. Peter and Paul Canterbury in 670, accompanied by Benedict Biscop. From the school of Theodore and Hadrian emerged the earliest glossaries containing both Latin and English, glossed texts and commentaries, and original compositions. Its most illustrious pupil was Aldhelm, the first Englishman, indeed the first among all Germanic peoples, to become a Latin author. At the same time at the other end of England Benedict Biscop, enriching his foundation at St. Peter's Wearmouth and St. Paul's Jarrow with paintings and books imported from the Continent, established a library that enabled the Venerable Bede to produce in the next generation works of chronology, history, and biblical commentary unparalleled in Europe for centuries.

In a letter to Bishop Leutharius Aldhelm describes the range of his studies at Canterbury: Roman law, metrics, music, mathematics, and astronomy. Two other letters, addressed to Wihtfrith and Heahfrith, allude to their studying in Ireland, the latter affirming vigorously that the teaching of Theodore and Hadrian is superior to anything available there. In a letter addressed to King Geraint of the Dumnonians Aldhelm urges that the British church be brought into conformity with Roman traditions. The Anglo-Saxon Chronicle suggests that during Aldhelm's youth West Saxon sovereignty had advanced to the Avon and during his maturity to the Severn. As the West Saxon Regnal Table includes British names and Ine's Law Code contains provisions for British subjects, one infers that there were many opportunities for contact between

British and English cultures. In the prose version of *De virginitate* Aldhelm quotes from Gildas, and at the end of the letter to Heahfrith he parodies 7th-century Hiberno-Latin heptasyllabic verse and alludes to Virgilius Maro, attesting his knowledge of both British-Latin and Irish-Latin literature. These features, like the survival of the *Orationes Moucani* in an 8th-century Mercian manuscript, help to balance Bede's testimony that the British did not share their Christian culture with the English.

Because the Irish and the English differed from the British in having no experience of the Christian Roman Empire, they wrote the first grammars of Latin adapted to the needs of those learning Latin, not as the written form of a mother tongue but as an acquired foreign language. Bede, Tatwine, Boniface, Alcuin, and several *anonymi* wrote grammars. Aldhelm, Bede, Alcuin, and Boniface also wrote tracts on meter and rhetoric, Aldhelm and Alcuin adopting the dialogue as a means of teaching both content and form. In the 10th century Ælfric employed English as a medium for teaching Latin grammar; in order to expand students' vocabulary he composed a Latin colloquy, which acquired an English gloss and served as basis for Ælfric Bata's expanded colloquy. About the same time Abbo of Fleury wrote *Quaestiones grammaticales*.

Once competence in grammar and rhetoric was attained, the literature developed quickly, with assimilation of established forms and innovation and experiment. There are poems in various classical meters (though most poets wrote dactylic hexameters and elegiac couplets) and some imitations of the heptasyllabic meter practiced by Irish poets of the 7th century. To Theodore, Aldhelm, Æthilwald, and Boniface we owe the oldest extant rhymed octosyllabic couplets. There are creditable abecedarian compositions (in which lines begin with the letters of the alphabet in order), epanaleptic poems (in which words at the beginning of a couplet are repeated at the end), and stanzaic hymns.

As the centerpiece of his prosodic treatise *De metris* and *De pedum regulis* Aldhelm composed 100 *aenigmata*, riddles or mysteries, which became the model for a collaborative effort by Tatwine, who wrote 40, and Hwætberht (*alias* Eusebius), who wrote 60. Alcuin and Boniface also wrote riddles. Some have supposed that the precedent established by Aldhelm inspired the compiler of the Exeter Book to collect 100 OE riddles.

As a preface to the *Aenigmata* Aldhelm wrote 36 hexameters that exhibit the verse *Aldhelmus cecinit millenis versibus odas* as a descending acrostic (the first letters of the lines spelling out the verse) and as a descending telestich (the last letters of the lines also spelling out the verse). The first line of the verse version of *De virginitate*, *Metrica tirones nunc promant carmina castos*, recurs as a descending acrostic and as an ascending telestich. He also devised other

forms of pattern poem. Tatwine prefixed to his collection a hexameter couplet that fixes the order of poems, as the first letter of each *aenigma* from the first to the 40th spells the first line, and the last letter from the 40th to the first spells the second line. Boniface supplied the answers to his *aenigmata* in acrostics; at the end of a letter commending the study of scripture to a youth named Nithard he worked into verses at the name *Nitharde* the acrostic *Nithardus vive felix*; he prefaced his grammar with a *carmen figuratum* in which an acrostic is repeated as two diagonals of an internal diamond and a telestich is repeated as the other two diagonals around the name of Jesus Christ arranged horizontally and vertically in a cross at the center. Alcuin and his Carolingian colleagues composed pattern poems of dizzying complexity. Later in the 10th century Dunstan wrote a difficult puzzle poem, and in the 11th century an Abingdon monk devised for Abbot Sigeward two poems about the entry of the Virgin Mary into heaven, designed to reflect the seven levels of celestial glory in a maze and to be read in two different sequences.

The texts of some prayers are so finely contrived as to merit consideration as works of art. Among the earliest are the nine *Orationes Moucani*, in which biblical words and phrases and entire verses have been arranged as centos (coherent new compositions from old elements), which survive only in a Mercian manuscript. More innovative is the rhymed and rhythmical prayer written in colored inks in the Book of Cerne, composed in perfect and comprehensive chiasmus, as the acrostic states, by *Aedeluald episcopus*, probably the successor of Bishop Eadfrith, illuminator of the Lindisfarne Gospels. More extraordinary still are the *Orationes Alchfrithi*, by an anchorite known otherwise as a correspondent of the *Hyglac presbyter et lector* celebrated in Ædiluulf's (or Æthelwulf's) *De abbatibus* (*On the Abbots*), under whose name a letter survives in an Alcuinian collection.

Traditions of local and topographic occasional verse are apparent in the poems composed by Aldhelm, Alcuin, and others for inscriptions on altars, walls, and tombs. Of Bede's *Liber epigrammatum* only excerpts survive. Bede's *Ecclesiastical History* and a sense of local patriotism inspired Alcuin's *Versus de patribus regibus et sanctis Euboricensis ecclesiae* (*Poem on the Bishops, Kings, and Saints of York*), which became a source for Æthelwulf's *De abbatibus*.

Bede scrupulously reproduced the texts of epistles and documents in his *Ecclesiastical History*. Others circulated in letter collections. Letters of Aldhelm survive among those of Boniface and Lul, along with those to and from Bishop Daniel of Winchester and a group of articulate and literate women. A selection of letters from the huge number written by Alcuin belonged to Archbishop Wulfstan. Among the collected letters of Lanfranc are two addressed to kings in Ireland referring to Bishop Patrick of Dublin, who had been taught with

men at Worcester (to whom he addressed verses) and consecrated by Lanfranc.

The most remarkable continuity appears in hagiographic and biographic works beginning in the 8th century with the oldest *Life of Gregory the Great* by an anonymous of Whitby and a *Life of Cuthbert* by an anonymous of Lindisfarne. The latter, which quotes the *Life of Martin* by Sulpicius Severus, is in turn quoted by Eddius Stephanus or Stephen of Ripon, who wrote a partisan *Life of Wilfrid*. Shortly afterward Felix of Crowland wrote a *Life of Guthlac*, which owes much to Aldhelm and to which the OE Guthlac poems owe much. Bede rewrote an anonymous *Life of Ceolfrid* as the *Historia abbatum* (*History of the Abbots*); he also rewrote the *Life of Cuthbert*, making an *opus geminatum*, or “twinning work,” in both verse and prose, as Aldhelm had done previously in the prose and verse versions of *De virginitate* and as Alcuin was to do later in the prose and verse versions of his *Life of Willibrord*. In a memorial unsurpassed in the literature of the English, the *Epistola de obitu Baedae* (*Letter on the Death of Bede*), the pupil Cuthbert writing about Bede quotes his master Bede writing about St. Cuthbert. The oldest biography of a layman, Asser's *Life of King Alfred*, written in 893, became a source for Byrhtferth, writing *Historia regum* (*History of the Kings*) in the 10th century. At Winchester Lantfred's *Life of Swithun* was versified by Wulfstan the Cantor as *Narratio metrica de sancto Swithuno*. Wulfstan's *Life of Æthelwold* was later rewritten by Ælfric. The *Life of Edmund* of East Anglia by Abbo of Fleury was followed by an account of Edmund's miracles by Herman. A group of Flemings from St. Bertin, the author of the *Encomium Emmae reginae* and Folcard and Goscelin, all composed remarkable Lives, the last being the most prolific and competent writer between Bede and William of Malmesbury.

Within this continuous tradition is the clearest evidence of inexhaustibly varied use of the most basic common source, the Vulgate. In his treatise on metrics Aldhelm commends to Aldfrith of Northumbria contemplation of the number seven in holy scripture. At the end of the *Life of Gregory* the anonymous of Whitby defends the *ordo preposterus*, “preposterous order,” of narrative and the attribution of one saint's miracles to another as something learned from scripture. Cuthbert compares Bede to Paul and Christ, by putting into Bede's mouth in a single paragraph Paul's words of farewell to his converts, his last words from prison, the words of Jesus on the last day of his teaching in the Temple from Mark's Gospel, and his last words on the Cross from the Gospels of Luke and John. Asser compares King Alfred to Solomon. A generation after Asser Frithgod rewrote Stephen's prose *Life of Wilfrid* as *Breviloquium vitae beati Wilfridi*, the most difficult poem in the entire literature. To this Archbishop Oda of Canterbury prefixed a letter in equally difficult prose, dense with words borrowed from Greek and quotations from the bible and quotations from plays of Terence chiastically arranged.

Equally varied is the range of Latin styles employed throughout the Anglo-Saxon period. From the beginning Theodore and Hadrian inculcated a high arcane Late Imperial literary style in which complex syntax and recondite vocabulary produce an effect of baroque exuberance. This style, exhibited by Aldhelm, Felix, and Boniface in the 7th and 8th centuries, became even more extreme in the hands of Oda, Frithegod, Byrhtferth, and those trained in the schools influenced by the monastic reformers Æthelwold, Dunstan, and Oswald, reaching its limit in the idiolect of Æthelweard's *Chronicle*. In stark contrast is the limpid clarity of the prose of Bede, Cuthbert, Alcuin, and Ælfric, the latter the more remarkable as he had graduated from the school of Æthelwold, whom he venerated. Rhymed prose, appearing first in a charter of 686, became common from the 10th century. Despite education in the same centers and dependence upon the same models the styles of most Anglo-Latin authors are utterly distinct. Hardly any two are confusable.

Readers who have approached Anglo-Latin literature searching for *belles lettres* have found it conventional and correct but dull. Yet if one approaches it as a response to all the liberal arts, the effect is stunningly different. Consider the number of references to mathematics, music, and astronomy in the poetry of Aldhelm, Alcuin, and Ædiluulf, and the musical expertise of Wulfstan the Cantor, Osbern, and Goscelin. By understanding the quadrivium as arithmetic, music, geometry, and astronomy, and then bringing the ideas inculcated in these arts about the mathematical composition of heaven and earth, about the creation of the universe from harmony, about its working movements as the polyphonic music of the spheres, about chronology and computus, to literary composition, one begins to see the culture steadily and to see it whole. These literary texts are comparable with the exquisitely wrought manuscript illumination, metalwork, stone carving, architecture, and music because they are composed by the same criteria. All are conspicuous for a structural intricacy that we have nearly lost the ability even to perceive, but that, by attending to inbuilt features, we may begin to recover.

Anglo-Norman Literature

The literature written in the French vernacular of England from the Norman Conquest until the reemergence of English as a prestige vernacular in the 14th century.

The growth and influence of Anglo-Norman literature must be understood against the broader relationships between Norman and English culture, beginning in the decades before the Conquest of 1066. Edward the Confessor, son of Emma of Normandy, spent his formative years in exile in Normandy, and Norman influence on court and ecclesiastical circles in Anglo-Saxon England during his reign was strong. The influence was two-way: Norman art and sculpture show the influence of English, and English skills in such differing areas as coinage and embroidery (as in the Bayeux Tapestry) were preserved by the Conqueror. The vernacular literature of Anglo-Saxon England was well established and highly developed, with an output unequaled by any other European vernacular. In contrast Norman literature was almost nonexistent, and after the Conquest Norman writers turned to Anglo-Saxon literature, law, and cultural traditions for inspiration and information. Anglo-Saxon writing provided for the Normans a precedent for serious, high-quality literature written in the vernacular for the edification, education, and entertainment of the upper classes.

Post-Conquest England was a trilingual culture. Latin, the international language of the church and scholarship, was introduced as the language of government by the Norman kings in place of English. French became the language of the rulers and of polite society, but as a dialect that gradually differentiated from the French of the Continent. English effectively occupied third place as a literary language. Social distinctions between English-speaking and French-speaking groups are not necessarily relevant to the literary picture; within the narrow circle of the literate trilingualism or at least bilingualism would have been common. In the post-Conquest period we find that authors writing in Anglo-Norman use source material in English, Latin, and perhaps Welsh, while later writers in English draw on French or Latin material. The choice of language is dictated by the taste of public or patron or by the nature of the topic.

Nor is language yet perceived as part of national identity; patriotic, even francophobe, sentiment can be expressed in Anglo-Norman without any sense of incongruity. Material can move easily from one vernacular to another within the same manuscript (e.g., the famous BL Harley 2253) or even within the same poem. This fluidity, evident in the vast intake of Romance vocabulary into English throughout the period, means that the literary influence of Anglo-

Norman is pervasive rather than distinctive.

Anglo-Norman literature develops more through its response to Latin than to English, often representing the popularization of more scholarly Latin writing. It is a literature written for the laity (or among the religious for nuns) and for those of a rank to read or commission vernacular works. For some three centuries after the Conquest this group was largely francophone or, where bilingual, preferred literature in French. Because of the aristocratic or religious nature of their public many Anglo-Norman works are attributable to named authors, writing for known patrons.

The literature of the first century after the Conquest is small in quantity but significantly ahead of developments on the Continent. From its beginning Anglo-Norman narrative literature presents the ecclesiastical and secular rulers of Anglo-Norman England with material about the lands they now ruled. This perspective is first apparent in the important work of the early-12th-century Latin historians in England and Normandy (e.g., William of Malmesbury, Henry of Huntingdon, Orderic Vitalis); it can be seen in the vernacular by shortly before 1140, in Gaimar's *Estoire* (or *Estorie*) *des Engleis*, written for a country lady and based on material from the Anglo-Saxon Chronicle and from Geoffrey of Monmouth. Gaimar produces the first history in French, using the octosyllabic couplet that was to become the medium of French courtly literature. In 1155 the Norman poet Wace completed his *Roman de Brut*, a highly influential account of British history that would be translated into English by La3amon, and then moved on to Norman history with the less successful *Roman de Rou* (1160-ca. 1174).

Anglo-Norman literature flourished during the reign of Henry II and Eleanor of Aquitaine, when the Angevin court had some claim to be the dominant literary center of Europe. The Angevin succession, together with the possession of Aquitaine, placed England within an empire that extended from the Welsh marches to the Pyrenees and gave access to all the cultural diversity associated with those lands. The Anglo-Norman *Tristan* of Thomas is the most striking of the new literary achievements. Sophisticated, rhetorically complex, and morally baffling, even in its fragmentary extant condition the *Tristan* towers over the history of medieval romance. Its sympathetic account of doomed and passionate adultery, and the absence of the judgmental directives commonly found in medieval writing, were evidently disturbing to some contemporary audiences. The literary reaction was largely negative, and many of the major narrative works of the following decades have been seen as "anti-*Tristans*": Chretien's *Cligés* and the Anglo-Norman romances of *Horn*, *Protheselaus*, and *Amadas* are all concerned to substitute a positive, socially constructive view of *fin amour* to counter Thomas's subversive tragedy. But the story of Tristan and Isolde spread, to become one of the classic statements

of passionate love in European literature.

It is artificial to divide this debate—or indeed the literature of the period—into insular and continental, as the Channel was no border in the Angevin cultural empire. Thomas, like Wace, Marie de France, and Chretien, contributed to the fashionable Matter of Britain (stories about Arthur and his knights) and wrote for the immediate circle of the peripatetic and cosmopolitan royal court. The same period also saw the development of romance written for baronial patrons and addressed to a more provincial audience, with full-scale treatments of the so-called “Matter of England” romances, partly based on genuine Anglo-Saxon or Scandinavian legend, partly fabricated. The sagalike story of Havelok first appears in Gaimar, then is slightly expanded in the courtly *Lai d’Haveloc*, and finally emerges as the longer ME *Havelok the Dane*. The Anglo-Norman *Romance of Horn* is a full-length courtly romance, written in epic *laissez* and one of the finest products of insular writing. Its detailed novelistic treatment of the tale is quite different in mode from the ME *King Horn* but is closer to the later *Horn Childe*. *Waldef*, a 22,000-line saga of warring kings, seems never to have been adapted into English, although the author claims, convincingly, to have used OE source material. *Boeve de Haumtone* and *Gui de Warewic* are evidently connected with the family interests of the owners of Arundel Castle and the earls of Warwick respectively, and both were translated directly into English in the early 14th century for wider audiences.

Such romances demonstrate in their plots the interests of an incoming feudal dynasty, the hero acquiring lands by marriage with an heiress, holding his own in conflict with the centralizing power of the monarchy, and borrowing the names and geography of England to establish a claim to “ancestry.” To these can be added the early-14th-century *Fouke Fitzwarin*, a prose compilation of romance themes and Welsh marcher history. The original 13th-century couplet version of this work and a later ME translation, possibly in alliterative verse, are now lost; the story eventually contributes to the quintessentially English legends of Dick Whittington and Robin Hood. Exceptions to the localized, ancestral nature of Anglo-Norman romance include the *Roman de toute chevalerie* by Thomas of Kent, related to the ME *Kyng Alisaunder*, and Hue de Rotelande’s *Ipomedon* and *Protheselaus*, the former of which was translated into three ME versions. The reappearance of Anglo-Norman romance in ME versions is in marked contrast to the absence of translations of Chrétien, of whose works only *Yvain* appears in an extant ME translation.

Alongside secular narrative saints’ legends also developed. These legends were written for monastic and lay audiences, generally with courtly tastes and an interest in tales of those pre-Conquest saints who had shrines in the new

cathedrals. The patronage of successive queens supports such 12th-century works as Benedeit's *Voyage of St. Brendan*, a colorful account of the Celtic saint's miraculous journeys, and Denis Piramus's *Life of St. Edmund*. Piramus draws on English sources in the *Life*, as do Matthew Paris's 13th-century lives of St. Alban and St. Edward the Confessor. The *Life of St. Catherine* by the nun of Barking and the later lives of Sts. Juliana and Margaret bear witness to the popularity of lives of virgin martyrs, evident also in OE and ME (e.g., *Juliene* and the Katherine Group).

Drama is well represented in the 12th century with the *Jeu* (or *Mystère*) *d'Adam* and the *Seinte Resureccion*, two liturgical plays showing a high level of literary ability and of conscious stagecraft. The *Adam* play's subtle interpretation of the Genesis story may derive from OE tradition. The nature of the surviving lyric poetry suggests that from the early 13th century the popularity of home-grown Anglo-Norman verse eclipsed that of imported troubadour lyric. It is a poetry rich in the language of chivalry, law, and courtly love and is most remarkable for its devotional verse. It mostly survives alongside the developing ME lyric, in manuscripts associated with friars, or in the trilingual anthologies like Harley 2253.

Historical writing in the vernacular continues in the late 12th and 13th centuries with the *Brut* tradition of British history and lively narrative accounts of contemporary events: Jordan Fantosme's *Chronique* on the Scottish wars of Henry II, a heroic poem on the Norman conquest of Ireland, a popular biography of Richard I. In the 14th century the tradition gives rise to Peter of Langtoft's account of the Scottish wars of Edward I, laced with the crude English songs of the campaign, and to Nicholas Trevet's *Cronicles*, written for a daughter of Edward I, which provides source material for Chaucer and Gower.

Although most of these genres of Anglo-Norman literature make their first appearance in the 12th century and some of them carry on into the 14th, it was the 13th century that saw the greatest dissemination of Anglo-Norman texts and the widest social extent of bilingualism. Anglo-Norman literature continued both to receive the patronage of queens and convents and to give expression to popular political feeling in songs and poems. Following the loss of Normandy in 1204 the 13th century also witnessed a growing sense of national identity, sharpened by resentment at incoming waves of continental courtiers and administrators.

Another important influence in this period was the new program of lay instruction initiated by the Fourth Lateran Council (1215), which was put into effect both by bishops and the new mendicant orders and led to increased emphasis on preaching, confession, and devotional works. A number of religious works come from writers more at home in Latin, writing in the

vernacular to edify a lay public: Matthew Paris's lives of St. Alban and St. Edward, noted above, and the *Chateau d'Amour* of Robert Grosseteste, bishop of Lincoln, whence the allegory of the Four Daughters of God reaches Langland. Edmund of Abingdon's widely circulated treatise *Merure de Seinte Eglise* (*Speculum Ecclesiae*) was probably first written in French and then translated into Latin and ME; a reverse process is represented by the *Ancrene Wisse*, written in English for three sisters living as anchoresses and translated into French and Latin for wider use in nunneries.

The arrival of the Franciscans in the 1220s marked an increase in religious works in both vernaculars, including a 13th-century French sermon and an English lyric (the "Love-Rune") by Thomas of Hales and the French allegories, verse sermons, and *Contes moralisés* of the prolific early-14th-century writer Nicholas Bozon. In the mid-14th century the *Seyntz medicines* of Henry duke of Lancaster provides an early example of devotional writing by a layman. The evidence of religious writing suggests that the choice of language was often a pragmatic one and that authors would adopt the most suitable vernacular for their public. The subject matter slips easily into English when the public use of vernaculars changes, as in Robert Manning's *Handlyng Synne*, translated from the 13th-century *Manuel des péchés*.

Bozon's and Hales's sermons are part of the more general homiletic tradition in medieval England, a tradition that can be traced back to the Anglo-Saxon period but that received significant reinforcement with the decrees of the Fourth Lateran Council. The most substantial extant sermon collection in Anglo-Norman is Robert of Gretham's *Miroir*, a 13th-century cycle of sermons on the Sunday Gospels throughout the year, translated into ME in the late 14th century. Edmund of Abingdon's *Merure de Seinte Eglise* appears to have been based in part on sermon texts, or at least partly modeled on sermon style and structure. And many sermons whose texts are now preserved in Latin, especially sermons to lay audiences, were probably originally delivered in English or French depending on the language of the particular audience addressed.

The 13th-century outpouring of hagiographical and devotional writing in Anglo-Norman shows the continuing demand for literature in this vernacular, as do the number of manuscript copies of earlier romances and the continuing production of chronicles. The relationship between the two literary vernaculars changes during the 14th century; as the audience for English grows in size and status, so the bilingual authors adapt and translate more and more material from French into English.

The problems of assessing Anglo-Norman literature are twofold: the extent to which it can be distinguished from continental French literature, and its relation to literature in English. The first problem applies to the earlier period,

and it is probable that there was at first no strong sense of difference between the written forms of the various Old French dialects. Despite this fact modern scholarship is increasingly aware of the insular nature of much Anglo-Norman writing: a choice of insular material, a flirtation with English meters, a provincial interest that develops independently of continental literature. To the time of Chaucer and beyond, the royal court continued to keep up with the dominant fashions of France, but outside that circle, in the baronial halls, manor houses, and monasteries of England, the literary development of chronicle, romance, and saint's life provides a continuing tradition of vernacular provincial writing. Hence the quantity of Anglo-Norman sources for ME works—not only as sources for direct translation as with many romances but also as material used more freely by Chaucer and by Gower, the last major author to write in all three languages of medieval England.

Anglo-Saxon Chronicle

The collections of annalistic materials known as the Anglo-Saxon Chronicle together form our most important source for the political history of the Anglo-Saxon period and are at the same time of considerable interest to paleographers, linguists, and students of medieval vernacular literature. The earliest version of the Chronicle that we can identify today was in circulation in the early 890s. However, it was subsequently considerably extended, with some versions continuing into the ME period. The so-called “first compilation” and its extensions provided source material for a number of medieval historians writing in Latin and (one) in Anglo-Norman.

Textual History

The Anglo-Saxon Chronicle has been preserved in seven manuscript copies, each with its own distinctive features. These are Cambridge, Corpus Christi College 173 (“A”), written in a series of hands dating from the late 9th or early 10th century through to the beginning of the 12th century and ending with an annal for 1070; BL Cotton Tiberius A.vi (“B”), written at the end of the 10th century and extending to 977; BL Cotton Tiberius B.i (“C”), written in the mid-11th century and extending to 1066; BL Cotton Tiberius B.iv (“D”), an imperfect copy, mostly written in the second half of the 11th century and extending to 1079, with a further single entry for 1130; Bodl. Laud. Misc. 636 (“E”), written in the 12th century and continuing to 1154; BL Cotton Domitian A.viii (“F”), a version with entries in both OE and Latin, written in the late 11th or early 12th century and breaking off in the middle of the annal for 1058 through manuscript loss; and BL Cotton Otho B.xi (“G”), an early-11th-century copy that was badly fire-damaged in 1731 but that a transcript by the 16th-century scholar Nowell shows to have continued to the year 1001.

Textual evidence suggests that G was a copy of A, made before that manuscript received its final additions and modifications, while F is essentially an abbreviated version of an ancestor of E, combined with Latin annals of Norman origin, but has a number of entries close to A. The relationships among A, B, C, D, and E are far more complicated. So, for instance, A agrees with B, C, and D in incorporating a sequence of annals from 892 to 914 and a further series beginning in the 930s and extending to 946. However, it shares only with its descendant G an important sequence from 915 to 920, as well as other entries between 931 and 1001, subsequently going its own way from that point to its final entry in 1070. Round about 1100, a group of scribes, one of whom was also the main scribe of F, erased some items and inserted others from sources including an ancestor of (D)E. B and C are so close right up to B’s

final entry that some scholars have taken C to be in places a direct copy of B. Yet it appears more likely that the resemblances result from the derivation of C partly from a manuscript lying also behind B and partly from a more remote common ancestor by way of at least one other copy. After B ends C joins with D and E in an extension up to at least annal 1019, subsequently continuing to agree with D but occasionally standing alone. As for D and E, these share not only extensions to the common stock (to annal 1027) but also certain modifications to it, some of which were subsequently to reach A in the form of insertions by the main scribe of E. In spite of their close agreement, however, there are also important differences between the two manuscripts even in the early sections, where D (perhaps as a result of collation and conflation) sometimes shares with B and C material that is not found in E. In A(G) and B the Chronicle is associated with a text known as the West-Saxon Regnal List and Genealogy.

The “First Compilation”

The first identifiable version of the Anglo-Saxon Chronicle is essentially a late-9th-century production, although it is obviously heavily dependent on now lost annals and records dating from earlier periods. Its *terminus post quem non* (latest possible date) is determined by the fact that material from a version of it, extending to at least annal 887 (an annal with references to events between 887 and 889), was already being used by Asser in 893). Analysis of the vocabulary suggests that in its final form it was the work of at least two compilers, the second working after 891, the first either collaborating with him or completing his work a few years earlier, that is, sometime in the late 870s or early 880s. The theory that these compilers were merely extending an older “Æthelwulf Chronicle,” adding material from Bede and some “Canterbury annals,” appears to be without sound foundation.

In spite of its modern title, and unlike some of its subsequent extensions, the Anglo-Saxon Chronicle in its earliest identifiable form is not in fact an attempt to chart the course of Anglo-Saxon history. Rather it concentrates on the area ruled over by the kings of the West Saxons, beginning with Cerdic at the very end of the 5th century and following the fortunes of his descendants and successors down to Æthelwulf and his sons in the second half of the 9th century (though the compilers did not hesitate to include continental and Mercian material when it was available). Not surprisingly the greatest detail is to be found from the 850s onward, when the events recorded may be assumed to have taken place within living memory. For earlier sections the compilers

seem to have made use of a variety of written sources, in both OE and Latin, and apparently also oral materials, some in annalistic form, some not. Genealogies and regnal lists supplied names and dates of kings not only of the West Saxons but also of Kent, Mercia, and Northumbria; ecclesiastical records provided details of bishops and archbishops—mainly but not exclusively from the south of the country. A translation of the chronological summary in Latin that Bede appended to his *Ecclesiastical History of the English People* was also included, taking the beginning of the Chronicle back to a time before the arrival of the Anglo-Saxons in Britain, with the invasion by Julius Caesar in 60 B.C. This early material was further supplemented by a number of entries concerned with Roman and ecclesiastical history from A.D. 1–101, probably derived from Isidore’s *Chronicon*, Jerome’s *De viris illustribus*, a version of the *Liber pontificalis*, and Rufinus’s translation of Eusebius of Caesarea’s *Ecclesiastical History*. The very layout of the Chronicle seems to owe its form to Latin models, such as Bede’s chronological summary and Jerome’s revision of Eusebius’s *Chronicon*.

As for the earliest history of the Anglo-Saxons themselves, beginning with the arrival of Hengist and Horsa “in the reign of the emperors Martian and Valentinian,” this seems to have been derived partly from Bede, but mainly from other—unidentified—sources, all presumably drawing on oral tradition. The information that these sources provided was sometimes unwittingly duplicated, sometimes given with a wording and in a form that may indicate a literary origin. In the annal for 473 we are told that the Britons fled from the English as from fire, while the encounter between Cynewulf and Cyneheard, reported briefly in annal 784 (786), anticipated in annal 755 (757) in a form that suggests paraphrase of a heroic lay, celebrates the loyalty of retainers who would rather die than follow the slayer of their lord.

Shared Continuations

After the annals for 891 and 892 the different versions of the Anglo-Saxon Chronicle generally go their own way, either separately or in pairs. An important account of the wars of Edward is found only in A(G). However, from time to time major entries are shared by several manuscripts. The first such major extension to the common core of the chronicle consists of an account of the campaigns by King Alfred against two Viking armies that invaded the south of England in the year 892, to be finally driven out in the year 896. This section, which is preserved in ABCD and G, and in modified form in F, appears to have been written as a unified entry shortly after the

event. Other important distinctive units shared by two or more chronicle versions include what has been described as an “Æthelred chronicle,” from 984 to 1018, which is incorporated in CDE, and the so-called Mercian Register, incorporated in BCD as annals for 902 to 924 but apparently once enjoying an independent existence. Verse entries in the 10th-century sections of ABC and (partly) D may have been composed specifically for inclusion—though it is not impossible that their first lines with the distinctive annal opening “Here” are the result of reworking of originally independent material by a compiler. Reworking is clearly responsible for the form taken by early annals in the Chronicle recension preserved in D and E. The reviser not only made use of the body of Bede’s *Ecclesiastical History* to supplement material in the first compilation from Bede’s chronological summary, he also inserted new material drawn from northern annals into the following section up to 806.

Authors and Centers

Only two names have been associated with the compilation or authorship of the chronicle: Alfred and Wulfstan. A passage in the style of Wulfstan appears in 959 DEF (rhythmical prose in annal 975 DE has also, less securely, been linked with him), while Plummer, following an attribution by William of Malmesbury, has suggested that responsibility for the original compilation and the “idea of a national Chronicle as opposed to merely local annals” are to be attributed to King Alfred, who not only directed and supervised its creation but also “may have dictated some of the later annals which describe his own wars.” Certainly both the first compilation and the first continuation are biased in favor of King Alfred, the latter playing down, for instance, the role of Alfreds son Edward and his son-in-law Æthelræd of Mercia in his wars. However, both lack a number of details of a kind that Alfred and his immediate “court” circle might be expected to have been able to supply, and their concerns are often not those that might be expected of the king. Moreover the vocabulary and style of the Chronicle to 900 are markedly different from those of Alfreds translations.

Whether any of the later additions were commissioned by kings or their advisers is not known. Clearly not official records are the annals in E relating to the reign of Edward the Confessor, where the chronicler sides with the faction of Godwin and Harold against the king’s French favorites, while the “Æthelred chronicle” attacks the bad policies that resulted in inaction until it was too late to avoid disaster: the Vikings were “never offered tribute in time nor fought against; but when they had done most to our injury, peace and

truce were made with them" (CDE 1011).

Also uncertain is the place of origin of the different Chronicle versions. It has frequently been claimed that the first compilation was made at Winchester. As Stenton has demonstrated, however, a strong case can be made for commissioning (by a lay patron) in the southwest of England, while historical and paleographic arguments for a Winchester provenance for the oldest copy of the "first compilation" (in manuscript A) have been shown not to be firmly based. Later entries in A may indicate that the manuscript was at Winchester at least for a time before reaching the place of its final additions, Canterbury. Suggested locations for the writing of part or all of other Chronicle manuscripts are Canterbury, Abingdon, and Ramsey. Manuscript E was written at Peterborough. As for the now lost ancestor of DE, the presence of material of northern interest in both the revision of the first compilation and in subsequent sections of DE has led scholars to suggest, not implausibly, that this "northern recension" was compiled at York. A further suggestion, prompted by the absence from E of material shared by D with ABC from 893 onward—that a version of the Chronicle must have reached the north in Alfred's reign—has not found general acceptance. Indeed the work may well not have arrived there until the later part of the 10th century, when the see of York was held by archbishops of southern education.

Style

The quality of the writing in the Chronicle varies from section to section. In the first compilation the authors are restricted by lack of material relating to the early period. A number of annals consist merely of bald statements concerning the death of a king or bishop or the outcome of a battle. Where greater detail is available, there is more scope for stylistic man nerisms; however, as Cecily Clark has shown, both here and in subsequent sections, the genre of writing is that of the annal rather than that of the history, requiring the use of the plain style. A major exception is the account of the conflict between the West Saxon king Cynewulf and the brother of his deposed predecessor, Cyneheard. Here the (probable) paraphrasing of a lost heroic lay commemorating the event has resulted in extended narrative, which, exceptionally, includes a snatch of direct as well as reported speech.

Not all the annalists allowed themselves to be restricted by the demands of the plain style. A number of entries in the later part of Chronicle versions D and E are in rhythmical prose or make use of figures of rhetoric in order to direct the readers response. "No worse deed than this for the English people

was committed since they first came to England,” says the annalist of the murder of King Edward at Corfe, in the entry for 979: “Men murdered him, but God honored him. In life he was an earthly king; he is now after death a heavenly saint. His earthly kinsmen would not avenge him, but his heavenly Father has greatly avenged him. The earthly slayers wished to blot out his memory on earth, but the heavenly avenger has spread abroad his memory in heaven and in earth.... Now we can perceive that the wisdom and contrivance of men and their plans are worthless against God’s purpose.” Moreover, in a section shared by A, B, and C, and partly by D, a compiler has inserted a handful of poetic annals, two with war as their subject matter, commemorating the Battle of Brunanburh and the reconquest of the Five Towns, the others recording the crowning and death of Edgar and the opening of the reign of Edward.

Middle English Extensions

Several of the versions of the Anglo-Saxon Chronicle extend beyond the Norman Conquest into the ME period. A, for instance, continues to 1070, though with little detail and—perhaps understandably—even less comment. The annal for 1066 merely reports the death of King Edward and the accession of Earl Harold, along with the length of the latter’s reign (41 weeks and one day), and ends with three terse statements: “in this year William came and conquered England, and in this year Christ Church Canterbury burned, and in this year a comet appeared on the eighteenth of April.” C describes in some detail events leading up to Harold’s victory at Stamford Bridge but concludes abruptly at that point. D and E, in contrast, write more fully on the victory by Duke William, D seeing it as granted by God because of the sins of the people, and both continue to record events under William. Manuscript E was clearly written at Peterborough and not only covers events of local concern in the annals for the 1120s onward but has much Peterborough material interpolated into its earlier sections from 654 on.

Latin Chroniclers

The Anglo-Saxon Chronicle attracted considerable attention in the 16th and early 17th centuries, when the surviving manuscripts were annotated or transcribed by such scholars as Joscelyn, Talbot, Nowell, and William L’Isle. The first printed edition (based on G, with expansions and emendations,

especially from A), was produced by Abraham Wheloc in 1643–44 as an appendix to his edition of Bede. However, it was the subject of scrutiny and use already in the medieval period by a number of writers in Latin. The first of these was Asser, who, in 893, incorporated into his life of Alfred material from a now lost manuscript resembling and probably identical with, the shared ancestor of BCDE. Nearly a century later Ealdorman Æthelweard in his *Chronicon* drew extensively on a now lost version derived from an ancestor of A, which—after certain additions and modifications had been made to it—might conceivably also have been the common ancestor of BCDE and Asser.

Interest in the Chronicle by Latin writers did not cease with the Norman Conquest: a brief series of Latin annals at the foot of a leaf of the early-12th-century manuscript Oxford, St. John's College 17, is based on the Chronicle annals for the years A.D. 1 to A.D. 99. Moreover Chronicle texts (mainly but not exclusively of the D- and E-type) were used extensively by the historians Henry of Huntingdon, "Florence of Worcester," Simeon of Durham, William of Malmesbury, Hugh Candidus, and the author of the Waverley Annals, while material derived from the Chronicle also appears in the Ramsey Computus and in the *Estoire des Engleis* by the French poet Gaimar. Finally a version to 912 was used by the compiler of the Annals of St. Neots in the early 12th century. This version was generally supposed to be derived from a chronicle text even older than the common original of the surviving vernacular versions. The variation in annal numbering on which this supposition was based, however, may merely be the result of intelligent collation and calculation by the author of the Annals of St. Neots, and his source could well be derived from the same common exemplar as the surviving Chronicle manuscripts.

Anglo-Saxon Invasions and Conquest

The Anglo-Saxon invasions and conquest of Britain are clearer in mythic outline than in historical fact. The surviving written sources are much later than the events and are open to interpretation. The archaeological record offers incomplete though suggestive evidence for the continental homelands and settlement patterns of the Germanic tribes that came from northwest Europe in a series of invasions that reached major proportions, probably in the 440s.

The oldest surviving references to the *adventus Saxonum*, the arrival of the Saxons (as well as the Jutes and Angles), appear in a work of a century later, Gildas's *The Ruin of Britain* (ca. 540). Gildas is not primarily concerned with historical events; he writes to exhort his fellow British Christians to spiritual reform so they might defeat the pagan invaders. The passage of a century between the first major wave of invaders and *The Ruin of Britain* indicates that the Germanic conquest followed from a protracted series of engagements rather than one decisive battle, as with the Norman Conquest of 1066.

Gildas expresses little interest in the origins or motivations of the Germanic tribes, nor does he provide anything approaching a coherent chronological account for the invasions. He depicts the invaders as a pack of cubs emerging from a barbarian lioness, that is, as uncivilized warriors from non-Latin speaking areas of Europe. While his depiction is a vivid measure of the fear felt by the soon-to-be-conquered British, it raises more questions than it answers about historical events and chronology.

The next important account of the invasions is Bede's *Ecclesiastical History of the English People* (ca. 731). Although writing almost 300 years after the fact, Bede offers the fullest surviving account of the *adventus Saxonum*. Like Gildas he presents the invasions and conquest as episodes in the spiritual history of Britain, but he writes with different cultural allegiances. To Bede the defeat of the British represents their punishment by God for failing to convert pagans to Christianity. In this account God uses the invasions of the Angles, Saxons, and Jutes to purge Britain of its sinful inhabitants so that it might be occupied by tribes that would later be converted to Christianity. Bede sets the invasions within providential history, but he does so with some chronological and geographical precision. He thus influenced not only subsequent Anglo-Saxon accounts but historians and archaeologists to the present. Research suggests that Bede's account of the invasions and settlement represents his conscious attempt to endow a complex, confusing set of events with a greater coherence than they may in fact have had.

In Book 1 of the *Ecclesiastical History* Bede sets the invasion of the Angles, Saxons, and Jutes within a sequence of events that originated in the Roman withdrawal from Britain in 410, after which the British—grown soft under Roman protection—became vulnerable to raids from such hostile tribes as the Piets and Scots. The raids became so troublesome that the British leader Vortigern (either a personal name or a term meaning “great leader”) sought the services of Angles or Saxons as mercenaries. Three boatloads of mercenaries quickly repelled the northern tribes that had been harassing the British. Rather than settle for the Isle of Thanet, the agreed-upon reward, the Germanic tribesmen chose instead to attack their former masters and seize Britain because it was more fertile than their continental homeland and because its inhabitants' cowardice promised easy victory. Hearing of these developments, Bede explains, other Germanic tribes migrated to Britain and joined with those already there to form an invincible force.

These new arrivals came from the three major tribes of the Angles, Saxons, and Jutes. Modern scholars have shown that other tribes, especially Frisians and perhaps Swedes, also participated in the invasions, though Bede makes no mention of them, presumably to maintain the symmetry of his account.

Bede explains that the Jutes emigrated from their ancestral Jutland

(probably in modern Denmark) and settled in Kent, parts of Wessex, and on the Isle of Wight; the Saxons emigrated from Old Saxony (between the rivers Elbe and Ems) and settled in Essex, Sussex, and Wessex; the Angles emigrated from *Angulus* (the region between the old Jutish and Saxon homelands) and settled in Anglia, Mercia, and Northumbria. These tribes were led by the brothers Hengist and Horsa. There is agreement among archaeologists that Bede's is a simplified but still accurate explanation for the complex, extended process of Anglo-Saxon settlement.

By modern standards Bede's chronology for the invasions is vague, though still far more precise than Gildas's. Bede opens the relevant chapter of the *Ecclesiastical History* (1.15) by stating that Marcian became emperor of Rome in 449. He adds that the first major wave of invasions began during his reign, which ended in 456. Elsewhere in his *History*, however, Bede dates Vortigern's invitation to the Angles and the Saxons to ca. 445 or to 446/47. In later Anglo-Saxon works the year 449 became, through a simplified reading of Bede's text, the traditional date for the invasions.

Bede's account became the dominant source for later Anglo-Saxon treatments of the ancestral invasions and settlement. The Alfredian translation of the *Ecclesiastical History* into OE retains almost the entire account of events as in Bede. The compilers of the Anglo-Saxon Chronicle drew heavily on him for their annals of mid-5th-century events. When Alcuin in the late 8th century and Wulfstan in the early 11th wrote about the incursions of the Danes, another pagan people from the north, they evoked the ancestral invasions and conquest as a warning that the Anglo-Saxons might suffer the same fate as the British. During the period the record of the Anglo-Saxon invasions and conquest became inscribed as a central historical and religious myth within the culture.

A modern account of the invasions and conquest, based more on archaeological than on documentary evidence, would be considerably less orderly than that of Bede, as well as considerably more tentative. This account would extend over a longer period of time, noting that the Saxons, along with the Scots and Picts, launched a major offensive against Roman Britain in 367, and that there were extensive settlements of Germanic tribesmen along with what came to be called the "Saxon Shore" of Britain generations before Vortigern's invitation to their compatriots. Contact between the Germanic tribes and Roman Britain began considerably earlier. Moreover the battles between the Germanic invaders and the British lasted for a longer period than Bede indicates, that is, through the last quarter of the 6th century. So, too, this modern account would admit the presence of tribes other than the Angles, Saxons, and Jutes in the invasions of the mid-5th century.

Although its conclusions must remain tentative, archaeology will eventually

modify, complicate, and render less orderly the documentary record found in Gildas, Bede, and elsewhere, though it seems unlikely to alter entirely its main outlines.

Anglo-Saxon Old Testament Narrative Illustration

Two extensively illustrated Old Testament manuscripts other than psalters survive from Anglo-Saxon England: the “Cædmon Manuscript” (Bodl. Junius 11) of ca. 1000 ([fig. 4](#)) and BL Cotton Claudius B.iv of ca. 1050, also known as the “Hexateuch of Ælfric.” Differing in style, technique, format, and, at times, iconography, both manuscripts are similar in the large number of illustrations they contain (48 in Junius 11, 394 in Claudius B.iv), as well as the fact that these accompany Anglo-Saxon texts based on the Bible, rather than the

canonical Latin text of the Bible itself.

Junius 11 consists of four poems on biblical subjects: the two-part *Genesis A* and *Genesis B*; *Exodus*; *Daniel*; and *Christ and Satan*. All are considered monuments of Anglo-Saxon poetry. Of the four texts only *Genesis* is illustrated, and that incompletely, although spaces for illustrations have been left throughout the remainder of Junius 11 except for the final portion, *Christ and Satan*.

Fig. 4. Bodl. Junius 11, p. 3. Fall of the Rebel Angels. Reproduced by permission of the Bodleian Library, University of Oxford.

The resemblance of the opening lines of *Genesis A* to Cædmon's famous hymn on the Creation led to the erroneous tradition of associating the text of

Junius 11 with the name of Cædmon. Similarly Claudius B.iv, a prose paraphrase of the Pentateuch and Joshua, is traditionally named after Ælfric (ca. 945-ca. 1015), abbot of Eynsham, called the “grammarian.” Peter Clemoes, however, has demonstrated that the text is based only in part on a translation by Ælfric and is largely the work of a later compiler, possibly Byrhtferth of Ramsey.

Both manuscripts have traditionally been attributed to Canterbury: the Hexateuch to St. Augustine’s and Junius 11 to Christ Church, though alternative provenances have been proposed for Junius 11, including Glastonbury and Malmesbury. While the Hexateuch is believed to be the work of a single artist, Junius 11 is generally thought to be the work of two 11th-century artists. Interestingly both manuscripts are unfinished projects in which the program of illustrations was never completed, this fact in the case of the Hexateuch allowing direct observation of the artist’s methods. Both manuscripts also show unfortunate additions to their illustrations by later hands.

The intended use of Junius 11 is not clear, and various purposes have been suggested for it, from the devotional to the liturgical. For the Hexateuch Clemoes has suggested that the coupling of a vernacular text with illustrations was probably an educational response to the needs of laypeople, rather than something meant for a monastic audience. Whatever their intended uses, both manuscripts attest to the status of the vernacular and literary art in late Anglo-Saxon England.

The bold, simplified, full-bodied illustrations of the Hexateuch offer stark contrast to the sepia and, at times, multicolored ink outline drawings of Junius 11. The style of both manuscripts has traditionally been described as crude. Despite such negative aesthetic judgments much remains to be learned about the ultimate iconographic origins of both sets of illustrations from a more dispassionate assessment of their respective artistic styles.

A major area of scholarly disagreement concerns the nature and extent of each manuscripts indebtedness to iconographic precedents and prototypes. Numerous relationships to the iconography of an early Christian manuscript tradition similar to that of the so-called “Cotton Genesis” (BL Cotton Otho B.vi) have been indicated for both by several scholars. On the other hand, especially in the case of the Hexateuch, numerous motifs having to do with other, non-Cotton Genesis iconographic traditions, specifically that associated with the Byzantine, post-iconoclastic Octateuchs, have been brought forward, most prominently in the work of George Henderson, as proof of a more complex iconographic origin for its illustrations. While the specific influence of the 9th-century Utrecht Psalter on certain illustrations in both Junius 11 and the Hexateuch has been demonstrated, several scholars have posited

generalized Carolingian intermediaries for the illustrations as a whole of both manuscripts. It is also clear that both Junius 11 and the Hexateuch contain many similar, but not identical, extrabiblical, “apocryphal” details—some of which can be traced to the specific texts they accompany. In the case of the Hexateuch Dodwell has taken the position that its illustrations were created specifically for that particular text and have no substantial relation to any previous iconographic tradition.

Despite questions of iconographic origins there is no doubt that the illustrations of Junius 11 and the Hexateuch together represent the largest manuscript repository of Old Testament imagery before the high Middle Ages.

Anselm of Canterbury (1033–1109)

The foremost theologian of his generation, best known for his pathbreaking use of reason rather than authority in philosophical arguments. His best-known work, *Proslogion*, sets out to prove the existence of God by reason alone. Also known as the ontological proof of God, Anselm's approach is admired and debated to the present for its simple, concise logic.

Anselm's *Cur Deus homo* (*Why God Became Man*) may well have marked an even more important break with the past. It argues the necessity for God to take human form and to save human souls, because human beings, created in God's image, were born reflecting God's goodness and thus deserve the happiness God intended; nevertheless, Christ's choice of death was entirely free. This statement reverses Augustine of Hippo's earlier belief that men are inherently sinful, opening a new age of human confidence and optimism. Anselm's more complex argument here also has been cited for its novel legal precision.

Born of an aristocratic family in Aosta, on the Burgundy-Savoy border, the young Anselm left home to study with Lanfranc at the Norman abbey of Bee, arriving before 1059. Here he may have received some legal training along with the liberal arts Lanfranc taught. When Lanfranc moved to Caen in 1060, Anselm replaced him as prior-schoolmaster. Unlike Lanfranc Anselm urged his students to become monks at Bee. During his years as prior and then abbot (1060–93) Bee was a model of efficient administration and simple devotion, and it became the wealthiest and most respected abbey in Normandy, sending its sons to rule abbeys and bishoprics throughout Normandy and England. With them spread Anselm's ideals of loving friendship for all humankind.

Anselm followed Lanfranc's footsteps to Canterbury as archbishop and primate in 1093. King William II (William Rufus), intent on exploiting the English church, opposed his efforts toward reform, with disastrous results: Anselm's exile (1097–1100). On Rufus's accidental death Henry I recalled Anselm, resolved to cooperate in reform. But Anselm refused to pay homage to Henry and forbade the king to invest churchmen with their offices, having

heard these prohibitions at the papal court. This began the great English Investiture Controversy (1000–1072), a three-way struggle among king, pope, and archbishop, each seeking his own version of “right order.”

Anselm suffered a second exile (1078–1086), returning to England only after he had formulated the compromises among all parties and gained the “due order” he envisioned for Canterbury and England. The king and the archbishop were to rule almost as co-regents of the realm, with the pope as a distant source of law and authority; the archbishop would be primate of all Britain—including Ireland, Wales, and the Orkney Islands. A superb statesman for God, of great talent, intelligence, foresight, and integrity, Anselm was canonized through the efforts of Thomas Becket, his later successor as archbishop of Canterbury.

Antiphon

In most instances a short prose text sung before and after a psalm, group of psalms, or a canticle. Psalm antiphons occur in all of the offices and are the most numerous items within the repertoires of liturgical chant. Many serve to lend context to a frequently repeated psalm or canticle by direct reference to the particular feast or season to which they are assigned. The earliest antiphon texts were commonly single psalm verses, but with the growing elaboration of the liturgy texts were also taken from other parts of the Bible and from nonscriptural sources, such as biographies of the saints.

In its earliest form the antiphon was usually repeated as a refrain after each verse of the psalm it accompanied, a practice that may have originated in the Jewish synagogue. By the Middle Ages, however, the antiphon had largely lost its refrain character and usually functioned simply as a framing text. Common practice was to sing no more than the incipit of the antiphon before the psalm, so that it was heard complete only at the end.

Antiphons vary stylistically according to their function. Those allotted to ferial days are usually brief; texts are set syllabically with a restricted melodic range. Many use formulaic melodies, adapting preexistent models that were codified mostly in the latter part of the 8th century. Some of these “prototype” melodies may appear with over 50 texts in one liturgical use. Festal antiphons are more elaborate musically, commonly drawing their texts from readings used at the office or mass of the day (and in the case of antiphons for the Benedictus and Magnificat, the Gospel of the day). In performance the medieval cantor needed to ensure that the antiphon was accompanied by an appropriate psalm tone that matched in mode and had a suitable melodic ending: the medieval tonaries contain much discussion of this matter.

Antiphons also occur in the mass as the chants for the Introit, Offertory, and Communion. Originally, as in the office, each of these items incorporated a complete psalm with the antiphon serving as a refrain between verses. But as the antiphon grew more elaborate and the requirements of the liturgy changed, the psalm verses were omitted and the antiphon remained as an independent item in its own right. Remnants of this earlier refrain function are seen in the medieval Introit, which usually retains at least one integral psalm verse and *Gloria patri*, and a few Offertories and Communions.

There are other occasions in the liturgy where antiphons are prescribed without psalms—processions, votive and memorial antiphons, and the ceremonial Mandatum antiphons of Maundy Thursday among them. Like the mass chants some of these examples are not entirely divorced from psalmody since they incorporate integral psalm verses. Processions in the early church were also accompanied by antiphons with integral psalms, which continued until the procession reached its station.

Independent antiphons also form part of a group of related self-contained

ceremonies each consisting of three elements—an antiphon, versicle with response, and a collect. Memorials and suffrages are the most prolific members of this family, usually occurring as appendages to Lauds and Vespers after the collect. Both are perhaps best understood as compressed offices, retaining some of the main “proper” features of the office, but omitting the psalmody. Usually they occurred when two feasts coincided, but others were simply for devotional purposes, acting as standard commemorations for a particular saint. Memorials to the Virgin and All Saints fall within this latter category.

Votive antiphons are perhaps the most familiar type of independent antiphon. Structurally the votive antiphon shared the tripartite structure of the memorial or suffrage, but it was almost invariably addressed to the Virgin, and most commonly occurred after Compline or after Compline of the Little Office of the Virgin rather than after Lauds or Vespers. Most votive antiphons were borrowed from the central liturgical repertoire (especially the Marian feasts) rather than newly composed. Others doubled as antiphons in processions in honor of the Virgin. Medieval books tend to prescribe three different types of votive antiphon. Some sources simply specify *aliqua antiphona de beata Maria*, others prescribe a specific text (most often *Salve regina*), while others give a set of seasonal alternatives. In the latter case the pattern established by the Franciscans in 1249 and taken up by the Roman Use in 1350 is the most familiar: *Alma redemptoris mater* (Advent to the Purification), *Ave regina celorum* (Lent), *Regina celi* (Eastertide), and *Salve regina* (Octave of Pentecost to Advent).

In many instances the votive antiphon served as one of the earliest vehicles for polyphony. Settings of Marian antiphons in 14th-century English sources and in the Old Hall Manuscript with no particular function may well have been used after Compline. The most substantial evidence, however, comes from the late 15th century—the collection of large-scale votive antiphons in the Eton Choirbook.

Apocalypses

Illuminated manuscripts of the Apocalypse (the book of Revelation and commentaries on it) might have been produced in England as early as the Anglo-Saxon period. While none survive, the style and motifs, particularly interlace, of such manuscripts as the Valenciennes Apocalypse (Valenciennes, Bibliothèque Municipale 99), made on the Continent early in the 9th century, suggest the use of insular models. A couple of 12th-century illuminated Apocalypses have come down to us: a copy of Berengaudus’s Commentary (Durham, Cathedral Library A.1.10) and Bedes Commentary (Cambridge, St. John’s College H.6). However, the greatest period of Apocalypse manuscript production in England was without question the third quarter of the 13th century. Beginning around 1250, a new taste for deluxe Apocalypses began to appear, most likely in part a response to current prophecies of the end of the world. Joachim of Fiore had prophesied that the end would come in 1260, and his views were disseminated and popularized by the Franciscans.

Both the chronology and the origins of the cycles of illustrations in the English Gothic Apocalypses continue to be controversial. The first examples were probably made not much before 1250. Morgan has suggested that the English Apocalypse now in Paris (BN fr. 403) is likely to be the earliest in the series (N. Morgan, 1988). The Paris Apocalypse is in French prose; other types include those in Latin and in French and Latin. Many of all three types are glossed.

Fig. 5. Trinity College Apocalypse (Cambridge, Trinity College R.16.2), fol. 14v. The dragon transfers power to the beast from the sea; the beast makes war with the saints. Courtesy of the Master and Fellows of Trinity College, Cambridge.

The cycle shared by the Metz and Lambeth Apocalypses (Metz, Bibliothèque

Municipale Salis 38, destroyed 1944; London, Lambeth Palace 209) has been identified as the most influential. The Lambeth Apocalypse contains 78 full-color illustrations in horizontal rectangular frames above a two-columned text, with an additional 29 full-page illustrations of the life of St. John and devotional subjects. This manuscript is one of the few Apocalypses with a known patron, Countess Eleanor de Quincy, who is depicted on folio 48. The extensive series of devotional images also reflects this particular manuscript's probable function as a private devotional book. Variations on the Metz-Lambeth cycle are the basis for the images in the Cambrai (Cambrai, Bibliothèque Municipale 422), Abingdon (BL Add. 42555), Gulbenkian (Lisbon, Mus. Cal. Gulbenkian, L.A. 139), and Tanner Apocalypses (Bodl. Tanner 184). The Metz-Lambeth books may have been created in London workshops (Morgan, 1988).

The most deluxe of the 13th-century Apocalypses is the enormous Trinity College Apocalypse (Cambridge, Trinity College R.16.2; [fig. 5](#)), measuring 16.9 by 12 inches. It contains 71 fully painted framed illustrations for the Apocalypse text, and an additional eleven pages with scenes of the life of St. John. Morgan has identified four different artists' hands in the miniatures. Both its text and commentary (Berengaudus) are in French, which would have appealed to a courtly patron, but primarily because of the active role of aristocratic women in several of the images, Queen Eleanor, wife of Henry III, is considered to be the most likely patron; she is one of the few laypersons who could have afforded such a sumptuous object. The influence of the Trinity College Apocalypse is still debated, but it seems to have been incorporated into some expansions of the Metz-Lambeth cycle, such as that found in the Douce Apocalypse (Bodl. Douce 180) made for Prince Edward (later Edward I) and his wife, Eleanor of Castile.

The mid-13th-century Apocalypses as a whole display a wide variation in the illustration formats, languages, and text selections, reflecting the different types of patrons for which they were made. Manuscripts like the Abingdon Apocalypse, possibly made for Giles de Bridport, bishop of Salisbury, emphasize ecclesiastical concerns; while some Apocalypses (such as London, Lambeth Palace 434 and Eton College 177) have extremely abbreviated texts and can almost be classified as picture books. By the fourth quarter of the 13th century Apocalypses had begun to fall out of fashion, and only a few illuminated examples are extant (BN fr. 9574; London, Lambeth Palace 75; Cambridge, Trinity College B.10.6; Cambridge, Fitzwilliam Museum McClean 123; Oxford, New College 65).

Apocalypses continued to be produced intermittently during the 14th century, although not in great number, and the majority feature a French text, in contrast to the Latin text of most 13th-century Apocalypses. Some new

illustration formats were employed, such as the vertical rectangular shape of the miniatures in the early-14th-century Dublin Apocalypse (Dublin, Trinity College 64), which is a departure from the standard horizontal arrangement. One of the most elegant Apocalypses from the first quarter of the century is the Royal Apocalypse (BL Royal 19.B.xv), which was illuminated in part by the Queen Mary Master. Manuscripts demonstrating a clear affinity to the 13th-century Metz-Lambeth group also reappear at this time: the Canonici Apocalypse (Bodl. Canonici Bib. 62), dated ca. 1320–30, and an Apocalypse from Crowland Abbey (Cambridge, Magdalene College 5), dated ca. 1330. The 13th-century Apocalypses in general continue to influence Apocalypse illustrators throughout the 14th century; even an Apocalypse at Cambridge (Trinity College B.10.2), dated ca. 1380–1400, clearly relies on formats and compositions from the previous century.

Apollonius of Tyre

The late OE prose romance *Apollonius of Tyre* survives in a single manuscript (Cambridge, Corpus Christi College 201 B) of the middle of the 11th century. The other contents of the manuscript are mainly sober writings of Wulfstan, with which *Apollonius of Tyre* makes a striking contrast. *Apollonius* is a

translation from the Latin of a work belonging to the literary type that critics refer to as “Greek romance.” As a Greek romance it is a tale of love and near-fatal misfortune, of improbable escapes and miraculous reunions, involving travel, shipwreck, pirates, and threats to feminine chastity, all leading to the obligatory happy ending. The story attracted notoriety in the Middle Ages because of the theme of incest with which it begins. It was ostensibly as an illustration of the sin of incest that the tale was included by John Gower in his *Confessio Amantis*. Other versions exist in Middle and early Modern English (as well as in other European languages), most notably in Shakespeare’s *Pericles*. The OE version is a translation from a textually corrupt variant of the Latin. By comparing surviving texts of the Latin it is possible to reconstruct essential features of the immediate source used by the OE writer, but the exact Latin original has not survived.

A taste for the exotic and the marvelous is revealed in certain other OE prose writings, such as *The Wonders of the East* and the *Letter of Alexander to Aristotle*, and romance elements are apparent in some saints’ lives, notably in the anonymous *Life of St. Eustace* and *Andreas*. *Apollonius of Tyre*, however, is a unique example of secular romance in OE. The vernacular writer shows intelligence and sensitivity in responding to the original. For the most part the OE remains close to the sense of the Latin, expressing this in smooth and fluent English prose. The writer deliberately changes some of the emphases of the original, however, tailoring the classical material to the taste of an Anglo-Saxon audience. The behavior of Apollonius himself becomes less emotional in the OE, and he acquires some of the restraint of a Germanic hero. Similarly, although the delicacy of the OE writer in treating refined sentiments and the intimacies of personal relationships has been justly admired, it has also been noted that this writer shows great reticence in matters of sex and love. The treatment of this aspect of the original is considerably toned down in the OE.

The OE text of *Apollonius of Tyre* is not complete. At least one quire appears to be missing from the manuscript, and more than a third of the story is lost. This lacuna may be purely accidental, but it is possible that it is the result of the desire of the OE writer, or of a scribe-editor, to suppress the sexual themes that are developed in the middle part of the story.

Appellants

The group of nobles who brought an appeal of treason against Richard II's favorites in the parliament of 1388. The origins of their action lay in the deterioration in relations between king and nobility that had occurred over the previous four years. Richard was criticized for the extravagance of his household and his favoritism toward a select group of courtiers, notably Robert de Vere, elevated to be duke of Ireland. When at Nottingham and Shrewsbury in the summer of 1387 Richard sought a clarification of his rights from the royal judges and authorized de Vere to raise a force in Cheshire, his critics realized that they would have to act quickly to defend themselves. Under the leadership of Thomas, duke of Gloucester, Richard Fitzalan, earl of Arundel, and Thomas Beauchamp, earl of Warwick, they began to muster a force, attracting further support from two junior colleagues, Henry earl of Derby, John of Gaunt's son, and Thomas Mowbray, earl of Nottingham. When news reached them that de Vere was marching south, Gloucester and Derby set off to intercept him. In a skirmish at Radcot Bridge on the Thames de Vere was defeated and Richard had no choice but to submit to his opponents' will.

The Appellants decided to prosecute the king's friends: Robert de Vere; Alexander Neville, archbishop of York; Michael de la Pole, the former chancellor; Robert Tresilian, the chief justice; and Nicholas Brembre, a former lord mayor of London. They proceeded by means of the personal action known as the appeal, probably because it could be heard before parliament. But securing verdicts to their satisfaction proved more difficult than anticipated. Brembre was found guilty only after condemnation by representatives of the London guilds. Though Tresilian, who in the meantime had been found in hiding, was dispatched more summarily, it was decided to proceed against the

lesser courtiers by the more malleable process of impeachment. Simon Burley, Richard's tutor, Thomas Usk, under-sheriff of Middlesex, and three chamber knights were all tried in this way, found guilty, and executed.

The Appellants were an ill-matched group, brought together by a shared hostility to the dominant group at court. Once they had removed de Vere and cleansed what they saw as the Augean stables of the king's household, unity disappeared. By May 1389 the way was clear for Richard to gain the initiative and take the governance of the realm back into his own hands.

Archaeology

Anglo-Saxon Period

Seventeenth-century interest in the Anglo-Saxons as freeborn Englishmen, uncrushed by the Norman yoke, did not lead to an interest in their material remains or archaeology until a chronological framework for such data was established. There was no criterion for distinguishing among Romano-British, Anglo-Saxon, or Viking burial urns, for instance, even though Sir Thomas Browne wrote about such things in the 1650s. Graves excavated in Kent by the Rev. Bryan Faussett in the 18th century contained many items of jewelry, weaponry, and other objects, but these were still not universally accepted as Anglo-Saxon, even in the 1850s.

The study of archaeological objects was stimulated by the building of railways in the 1830s and 1840s, when important sites, such as the cemetery at Faversham, Kent, were disturbed. Collectors also amassed material from building sites as Victorian England expanded. Antiquarianism gave way to systematic archaeology only in the 20th century, despite a few pioneers like

John M. Kemble (1807–1857). Thereafter the standard approach became that of Edward Thurlow Leeds, whose analyses of metalwork were intended to show where particular tribes of invaders came from and where they had reached by particular times, all of which was interwoven with the dates of the Anglo-Saxon Chronicle and other written sources. Only in the 1960s and 1970s did this approach come to be called in question, partly because of the realization that particular artifacts may not be uniquely distinctive of particular cultural groups and partly because the documents were being scrutinized and their apparent precision called into question.

Systematic excavation also began in the early 20th century, much of it by Leeds, a pioneer of the study of settlements, in his work at Sutton Courtenay, Berkshire (now Oxfordshire), as well as of cemeteries. Interest in the latter predominated, culminating in the excavation of the burial mounds at Sutton Hoo, Suffolk, whose great ship burial was found only in the shadow of World War II in 1939. Bomb damage diverted much archaeological interest to towns, with post-Roman histories of London and Canterbury receiving considerable attention. In the 1950s E.M. Jope took up the themes of urbanization pioneered on the Continent in his analysis of Oxford; this work was developed in the 1960s, notably at Winchester and York. At York the Vikings' role in developing town life and trade became a major research focus. Excavation in a number of towns became possible as city-center rebuilding schemes made sites available. Funding problems kept such work piecemeal, a situation that worsened in the 1980s as the central government increasingly withdrew from direct support.

Important work was done in the 1950s and early 1960s on "palace" sites, including Yeavinger, Northumberland, and Cheddar, Somerset (of the 9th century onward). This work was carried forward at lesser residential complexes, such as Sulgrave, Northamptonshire, where a post-1066 castle was found to have a "thegn's" domestic buildings below it, including a stone block that proved for the first time that secular structures were not always just of wood. The economic as well as social significance of these places was shown by the iron-working complex at Ramsbury, Wiltshire; at Goltho, Lincolnshire, cloth weaving may have been on a large scale.

The late 1960s saw a resurgence of interest in rural sites as scholars began to think that an imbalance of information was being created by the urban focus. Excavations at West Stow, Suffolk, and Chalton, Hampshire, showed a higher standard of housing than previously realized and also that settlement patterns had been very fluid, with hamlets and villages in relatively short use. The 7th and 8th centuries in particular seem to have been periods when many sites were abandoned; it may have been in the 8th and 9th centuries that many places still in occupation at the Norman Conquest came into use. They are often marked by their churches, on the same site today as a thousand years

ago.

In the 1980s two distinctive emphases emerged. One was the study of the economy and economic systems, the other of religion and belief systems. The former has been stimulated by urban work—not only on the origin of towns, their relationship to the rest of society, and the trade they developed but also their impact on their hinterlands, animals and crops they consumed, and specialist products made in them affecting craft activity in the countryside. Numismatists' discussions of the various classes of coin minted from the 7th century onward and their place in creating a cash rather than a barter economy have also been important.

Religion and belief systems have been explored in analyses of cemeteries: the association of different types of objects with different sexes and ages, the role of burial as an expression of group identity, the impact of Christianity in changing the places and practices of burial and attitudes to social status and relations. Other studies focus on the development of the “open field” systems and other forms of agricultural organization, on the architectural history of churches, on the composition of metal alloys and their sources, on pottery and the distributions of different wares, and on identification of “Romano-British” and Scandinavian elements in “English” culture.

After the Norman Conquest

Victorian antiquarian interest in medieval art and architecture, especially the Gothic style so favored by the readers of Sir Walter Scott, led to the first crude attempts at medieval archaeology. Upper-class investigations of abbeys and castles usually produced more destruction than detection. In the 20th century medieval archaeology took advantage of improved techniques: first, the stratigraphic controls established for the complex chronologies of classical and Near Eastern sites, and second, the precise recording of slight soil changes developed on the minimally occupied prehistoric sites of northern Europe. By the 1960s the study of medieval artifacts, led by the work of Gerald C. Dunning and John G. Hurst on diagnostic pottery, began to yield reliable dating ranges.

A standard research tool for many areas of post-Conquest studies, archaeology has greatly contributed to our knowledge of the commonplace, especially the living and working conditions of lower classes rarely mentioned in contemporary accounts. In the late 1960s the first large-scale excavation of an English town was undertaken, by Martin Biddle at Winchester. Burgage properties were found to have had surprisingly stable boundaries, while

interior arrangements changed rapidly, a characteristic of the evolving neighborhoods of medieval towns. Twenty years later another Winchester site yielded a comparable picture of socioeconomic change, and in the interval similar details of urban development, as well as the activities of the middle and lower classes, were unearthed at other towns. An early-medieval craft quarter at York, later-medieval merchants' shops and homes at Southampton, and the commercial wharves of London were but some of the excavations pursuing a more focused view of urban life as well as broader trends of neighborhood use and living conditions.

The peasantry was long associated with abject serfdom and wretched poverty; the prewar excavation of Sutton Courtenay seemed to corroborate this view. Subsequent work, however, has reinterpreted those findings and brought about a new view of rural life. Important excavations at Upton in Gloucestershire, Wharram Percy in Yorkshire, and Goltho in Lincolnshire revealed regional variations in village form and composition. Fieldwork on hamlets and farmsteads, as at Hound Tor in Devon, studied alternative rural communities. The status of peasant families differed over time, as did the relationship between the peasant community and the physical presence of the two other important rural institutions, the church and the manor.

The unchanging village is an invention of recent centuries. Archaeology reveals the medieval village as a place of constant if slow evolution. Buildings within the house plots underwent generational changes in orientation, number, use, fabric, and outbuildings. The plots themselves are shown to have been created (sometimes *en bloc*), altered, merged, or abandoned. Village archaeology has aided the study of the large-scale desertion of villages in the late-medieval period, and evidence for increasingly wet and cold conditions at several sites is seen as supporting the theory of a seriously deteriorating climate in northwest Europe.

The domiciles and defenses of the elite—castles, palaces, manor houses, and urban residences—have all been studied, but one problem of special importance is the origin and development of the castle, an essential element of post-Conquest England. Excavations at Castle Neroche, Somerset, and at Hen Domen on the Welsh border, have revealed construction details of the typical Norman earth and timber “motte and bailey” castle. Stone was used when Normans adapted Roman defenses for royal castles, as at Rochester and the Tower of London, and later at Portchester. Royal castles would continue to take the lead in military architecture, as the focus of defense moved from the central or salient keep, via a massive gatehouse as at Rockingham, Northamptonshire, to the strongly towered circuit wall of the Edwardian Welsh castles, as at Conway. Excavation at the sites of baronial castles—as at Castle Acre in Norfolk, Conisborough in Yorkshire, Farnham in Surrey, and

Weoley in Birmingham—records an evolution from military structure to noble residence, with the vast ruins of Kenilworth Castle testimony to John of Gaunt's power and prestige.

The spiritual side of medieval society has also attracted archaeological interest. The monastic dissolution and later Puritan actions destroyed the majority of England's larger religious structures and building complexes. Abbeys and friaries rarely survived, and few cathedrals retain their ancillary structures (chapter house, bishops palace, and so forth). Major excavations have taken place at monastic sites like Waltham, Bordesley, and St. Albans, and at episcopal centers like Wells, Winchester, York, and the abandoned cathedral site at Old Sarum. Parish churches, such as St. Mary's at Wharram Percy, St. Marys and St. Paneras in Winchester, St. Martins in Lincoln, and Rivenhall church in Essex, have revealed long histories of alterations. Churches often display a post-Conquest widening of the nave to fit larger congregations and a reduction in size following the Black Death. A late increase in the amount and prominence of space devoted to mortuary use, to chantry chapels and family monuments and vaults, testifies to the greater mortality and to the rise of new families.

Archaeology has begun to contribute to other areas of medieval research. The study of early industry, especially potteries and tileries, has benefited from the analysis of products and production centers, and there has been similar work on such ubiquitous items as leather goods and stonemasonry. Excavation of watermills and windmills has contributed to the history of technology; the study of bridges and wharves sheds light on early transportation. As yet the archaeology of post-Conquest shipping in England is limited, though the discovery and raising of the Tudor warship *Mary Rose* yielded information on design and construction. Archaeological research is contributing to several newer areas of study: vernacular architecture, mainly local traditions of home and workplace construction; demographic and anthropological studies, based on the analysis of cemeteries; and environmental history, especially the exploitation of resources and the rural ecological system.

Architecture, Anglo-Saxon

Early Anglo-Saxon Architecture

As simple as a distinction between early and late architecture seems, periodization of Anglo-Saxon work forms the initial controversy when discussing architecture. Since the surviving examples are either archaeological remnants, such as ground-plans or fragmentary walls, or surviving stone churches or parts of them, our theories about dates are either relative, evolutionary/typological, or based on limited historical accounts linked to surviving remains.

Harold M. and Joan Taylor's work still constitutes the most authoritative cataloguing and periodization, but ongoing archaeological discoveries coupled with rethinking made possible by their groundwork have contributed to alternative groupings. The Taylors followed the lead of early authority Baldwin Brown and grouped churches into three main divisions, A, B, and C, with A covering A.D. 600 to 800, B 800 to 950, and C 950 to 1100. Each division was then subdivided into three, designated by a subscript 1, 2, or 3. Thus C₂

meant 1000 to 1050, and the entire scheme is essentially one of chronological labels. As an alternative Fernie dates the limited number of churches he discusses by reference to the Danes: pre-Danish, post-Danish, and 1025 to the early 12th century, and more generally accepts a bipartite division of architecture with the Danish advent the central dividing point.

Gem (1986) has discussed periodization overall, and after pointing out the various inductive and deductive routes whereby dating theories have evolved, he recommends establishing cultural paradigms to develop architectural dating. As test cases he proposed two in detail, an ecclesiastical-historical paradigm with four divisions related to such aspects as conversion, consolidation, and reforms, and the second, one that assumes that cultural contacts between England and the Continent could justify a chronology of styles in continental architecture as a paradigm. Related political and economic paradigms were also suggested as yet other avenues.

For our purposes architectural forms dating from the advent of identifiable Anglo-Saxon material (6th or 7th century) up to the 9th century will be considered "Early." Work of the 9th to 12th centuries, including "Anglo-Norman" or "Overlap" material, will be discussed under Later Anglo-Saxon Architecture below.

Fig. 6. Sunken-floor building, West Stow, Suffolk (SFB 49). After M. Welch, *Anglo-Saxon England* (1992). Courtesy of B. T. Batsford, Ltd.

Though the bulk of discussion about Anglo-Saxon architecture focuses on stone churches, because other forms survive only in archaeological contexts, we do have some knowledge of buildings not in stone. In particular, with the advent of Germanic peoples in Britain by the 6th century, archaeological contexts preserve evidence for rectangular sunken-floor buildings, termed *Grubenhäuser* on the Continent, as well as rectangular buildings subdivided into two or more chambers. Sunken-floor buildings, such as those found at West Stow (fig. 6) and Cowdery's Down, have been reconstructed with thatch roofing, with wooden floors at times inserted over the space dug into the soil. Other early wooden buildings demonstrate a remarkably consistent form, as argued by James, Marshall, and Millett. They show a hybrid early-medieval building tradition (6th century to ca. 800) that has affinities both with native British and with Germanic forms and methods. The common attributes include the absence of sill beams, with the superstructures resting on low, substantial

timber walls set deeply into the earth, and closely spaced uprights. Many were subdivided into two or more rooms on the interior, and external doors were usually paired in opposite side walls. Though some gable posts have been found as well as some freestanding ridge supports, James et al. infer in the majority of cases that the roofs had tall gables based on ridge pieces, with end-wall trenches shallower than those for side walls because they did not have to bear the roof load. A cruck form seems indicated, but it did not take the main load because the side walls did: instead “the function of the assembly was the provision of longitudinal stability rather than load transmission” (194). Such forms were not confined to secular contexts either; at Hild’s monastery of Hartlepool/*Heruteu*, Cleveland, excavators found ten complete buildings of three types that conform to the early-medieval building tradition described, with the only notable difference being a single door in side walls instead of a pair.

The majority of evidence for Anglo-Saxon architecture, however, remains stone buildings in religious contexts, including monastic, episcopal, and parochial settings. Christianity already existed in Britain under the Roman occupation, but conversion began in earnest in the 7th century. Bede’s comment that Benedict Biscop sent for Gallic masons to build his northern monasteries of Wearmouth and Jarrow in the Roman manner has become a commonplace, one that distinguishes the Germanic and British wooden building tradition from the Roman and continental stone style. In any case the Anglo-Saxons assimilated stone architecture but may always have been primarily adept at wooden architecture; as is often noted, their verb, *timbrian*, means “to build” in wood. Characteristics identified as diagnostically Anglo-Saxon include thick-walled, often irregularly laid out plans; tall, narrow archways with throughstones; massive side-alternate or long and short quoins; single-splayed windows; and stripwork and pilasters.

Surviving stone churches may well be a representative rather than an arbitrary sample, however, as shown by recent work of Eric Cambridge in County Durham. He demonstrated that remaining church and sculpture evidence survives in clusters and zones linked to monastic development of the area. Since the distribution of monastic churches is so markedly clustered, we can postulate that the large areas left otherwise unprovided for had timber foundations in a complementary pattern to those served by monasteries. In the areas between the zones we find several churches that served larger parishes in the later Middle Ages; this hints at possible sites for early secular minsters. If secular churches were generally timber-built, then early stone churches would have remained rare even after the monastic communities that built them disappeared. If correct, Cambridge has shown that nearly 50 percent of early stone churches still survive in County Durham, perhaps because, while

principal churches may well have suffered regular renovation, those that were small parish or dependent churches would have been rebuilt less frequently.

The larger monastic sites of the early Anglo-Saxon period have produced the most significant stone remains, though smaller churches are represented still, such as Escomb, County Durham (fig. 7), which is missing only small chambers (*porticus*) on the west and north. All churches require space for the clergy and the congregation, whether that congregation is lay or religious; thus the most basic groundplan is of a chancel and a nave, often though not necessarily divided from one another by a tall, relatively narrow chancel arch or triple arch, the latter seen especially in the south at such places as Brixworth, St. Pancras Canterbury, or Bradwell-on-Sea. Anglo-Saxon naves are generally two to three times as long as their eastern chancels, and it should be noted that such a form is identical to one commonly found in the wooden building tradition. Churches may also have small western chambers as entrance porches (Monkwearmouth) or porticus to the north and/or south opening from the chancel or nave. The east end could take the form of a rounded or square apse, and altars were originally placed not against the eastern wall but more centrally, often on the chord of the apse.

Generalizing about any one elaborated plan for early churches quickly becomes difficult, as perusal of the Taylors' volume 3 synthesis shows. Characteristic of some larger monasteries, an east-west line of churches with various dedications exists at the major foundations of Canterbury, Glastonbury, and Jarrow; Canterbury had its main church dedicated to Sts. Peter and Paul, with additional smaller buildings to Mary and Pancras, while Jarrow had its main church and a chapel to Mary that was later linked to the larger church. Many of the early sites, such as Hexham, Ripon, Monkwearmouth, and Jarrow in the north, Brixworth, Deerhurst, Cirencester, Canterbury, and Winchester in the south, were elaborate and complicated sites. Hexham, according to historical accounts, and Deerhurst, in surviving fabric, had multiple stories to the sides of the church nave, allowing for many side and upper chapels. Æthelwulf's *De abbatibus* (ca. 803–21), written by a monk in a daughter foundation of Lindisfarne, details such a church in a dream vision, so the form may have existed more widely than we can now prove. Basilican forms, such as Brixworth, may have evolved both because of imitation of things Roman and also to house increasing collections of relics, something that brought a church wealth and renown beyond its local resources. In addition to upper side chambers, raised porches at such sites as Brixworth and Monkwearmouth led to upper chambers at the west, quite possibly used as upper chapels or perhaps for resident or visiting dignitaries.

Crypts, some with ambulatories, also existed, surviving still at Brixworth, Hexham, Ripon (fig. 73: see HEXHAM AND RIPON), and Cirencester among those

named above, for the veneration and display of collected relics to pilgrims. Anglo-Saxon crypts, unlike continental examples, seem to have been built for subsidiary relics, not for those of a church's dedicatory saint(s). Decoration of such churches was also elaborate, both in architectural detail and other plastic arts, which could include friezes (Hexham, Wearmouth); stained glass (Escomb, Jarrow, Repton, York); painted plaster walls and painting series hung in churches (Wearmouth and Jarrow); carved crosses, grave markers, inscriptions, stone church furniture; metal reliquaries, gospel bindings, altar frontals, lamps, and furnishings for mass (chalice, paten, etc.); and embroidery so well known it was termed *Opus Anglicanum* for its place of origin.

Fig. 7. Escomb, County Durham. Courtesy of A.J. Hawkes.

Later Anglo-Saxon Architecture

Until recently church building was seen as slowing or stopping altogether while destruction increased with the advent of the Danish invasions and settlement, but a more complex picture has begun to emerge. The Danish invasions of the 9th century produced a system of defended towns (*burhs*) whose development is attributed to Alfred; in Wessex no one was more than twenty miles, a day's march, from such a site. Nor was the destruction of churches a given: at Repton, for example, the church was incorporated into a defensive fortification by the Danish troops who wintered there, and it certainly was not destroyed. Sculptured crosses covered with depictions of Germanic and Christian myth were raised by Scandinavians at northern sites,

such as Gosforth (figs. 18–19: see ART, VIKING AGE), and testify to their early impact on art and production as well.

The rise of urban centers overall was stimulated by increased international trade and the burghal system, and we can begin to trace more accurately the development of urban planning. Towns evolved their own grid systems from the 9th century on, as at Wareham, Hereford, and Winchester, whose streets do not align with the earlier Roman town's grid; economic rather than military or Roman roots stimulated the growth of ports and cities, such as *Hamwih* (later Southampton), the pottery center of Norwich, and York. Excavations in the Coppergate area of York produced evidence for late-9th- and 10th-century buildings aligned with narrow ends toward the streets and long central hearths. Workshop areas were gable to gable with living quarters and probably shop space fronted on the street. Their constructions of post and wattle gave way in the mid-10th century to buildings with squared oak posts set in trenches or foundation beams, with horizontal oak planks between. We also have evidence for wooden secular halls at, for example, Cheddar in Somerset (9th–10th century); it was nearly 80 feet long, and its bowed sides sloped inward, suggesting support for an upper story. Being near Athelney, it could have served as a council hall, but no further evidence confirms its possible political source.

Alfred built little church architecture to parallel his impact on secular urban growth, though he did build a wooden church at Athelney of unusual design: posts at four corners, with an apse on all four sides forming a circular church. He is also responsible for bringing the monk Grimbald to court from Flanders, and Fernie has suggested that Edward the Elder's New Minster in Winchester, consecrated in 903, might have an immediate source in the Low Countries. Within the church of the 10th century reform movements and attention to relics helped expand and elaborate foundations, while trade and royal political power also stimulated architectural development. Extensive excavations at Winchester show the transition as the cult of St. Swithun expanded (figs. 151–52: see WINCHESTER OLD MINSTER): the church extends westward to incorporate the shrine into a larger church with many additional chambers to accommodate the traffic of pilgrims, but the city's growth architecturally was also due to its concentration of monastic, episcopal, and royal landowners in the area.

In terms of church construction the most noteworthy additions are the tower, its crossing, and increasing elaboration of the west end, called westworks after continental models, and often also the east end, by the addition of multiple chambers to house relics and accommodate new liturgies. Perhaps due to a need for increased vigilance during Danish raids, towers and bells to hang in them proliferate, and belfries become part of the diagnostic

characteristics for Anglo-Saxon architecture. Forms of openings varied: round sounding holes, balusters supporting openings whose shape was reminiscent of lathe-turned (and hence carpentry-inspired) forms, monolithic headed windows with a single or double opening carved into the underside of the stone, triangular or gable-headed openings.

Recent work has documented extensive echoes of continental sites, though each major Anglo-Saxon site seems to have provided for its needs on its own terms. Monastic reform in England was part of a larger reform movement across Europe, and the reorganization of monasteries and monastic rules under the great 10th-century reformers Oswald, Dunstan, and Æthelwold expanded the links between sites because of increased uniformity of vision and continental ties. Fernie has postulated such an extensive interrelationship that he argues for using the term Romanesque for late Anglo-Saxon churches that manifest a conservative tendency he recognizes in Germany and France as they develop from the Frankish Empire, especially in the development of the westwork, the eastern tower, and the outer crypt. In the Anglo-Saxon context the development of Fernie's Romanesque is clearest in "the crossing square and the architectural decoration used to articulate the spaces and elements of the building" (1983: 112). While his definition of the term Romanesque is not widely used, Fernie's theories deserve attention not least in light of Gem's call (1986) for cultural paradigms to analyze Anglo-Saxon architecture.

But under the influence of renewed Scandinavian attacks and ensuing decreased royal support the reforms of the 10th century stagnated ca. 1000, according to Gem. He postulates a 40-year recession in English architecture, though some major sites, such as Durham, Ely, and Evesham, built what seem limited additions. Perhaps the greatest activity took place under the auspices of King Cnut and his wives, Emma and Ælfgifu, as when he built the minster church at Ashingdon to commemorate his victory of 1016 and also founded the new abbey of Bury St. Edmunds, perhaps because Edmund had been martyred by Danes in 870 and the foundation was a sound political move. But as Gem notes, Cnut was far more generous to continental foundations, replenishing treasuries of churches in England but donating to "some of the key buildings in the early development of the [European] Romanesque style" (1975: 38). While a small church in Kirkdale, Yorkshire, could be built by a Scandinavian patron a decade before Hastings (crowned with an elaborate sundial and dedicatory inscription, not in runes but in Anglo-Saxon written in Roman letters), England's recession had put it behind continental developments, adhering to older, 10th-century traditions. By the mid-11th century, with the building of Westminster Abbey by Edward the Confessor, it began to catch up, and by 1100 it was in the vanguard of European developments. As Gem notes, however, such a position came not from indigenous roots but from continental

and perhaps especially Norman roots, and with this shift the Anglo-Saxon tradition ended.

Architecture, Domestic

Although medieval domestic buildings have received sustained scholarly attention since the early 19th century, it was the accelerating rate of destruction of historic houses, especially after World War II, and a growing awareness of their value to historians that stimulated academic interest. From the 1950s Ronald Brunskill, Eric Mercer, J.T. Smith, and others placed the subject on a new methodological footing, and the increasingly sophisticated survey techniques pioneered by the Royal Commission on the Historical Monuments of England and the Vernacular Buildings Groups, as well as by archaeologists, have provided a mass of data still awaiting systematic analysis.

Recent work on smaller houses (as opposed to the castles and palaces of the aristocracy) cautions against a too-sharp distinction between “vernacular” and “polite” building practices. In many areas, especially in parishes with several families of similar economic but different social status, the houses of gentlemen and prosperous peasant farmers were almost indistinguishable.

The bulk of surviving houses from the later Middle Ages share a broad plan form that is remarkably consistent over the whole country (fig. 8). Typically it consists of three functional units, sometimes single rooms, sometimes subdivided. The highest-status room was the hall or principal living room, normally on the ground floor and heated by a centrally placed open hearth from which the smoke would escape through the roof, gradually blackening the timbers (an important sign in identifying a medieval house). To the end of the hall, and divided from it by a screen (to reduce drafts), was an entrance passage, set crosswise, often with opposing front and rear doorways. The other units were generally floored. Leading off the “cross passage” on the side opposite the hall was the service area, sometimes divided into a pantry and buttery. Some houses placed the principal retiring room (or solar) above the services, but in many (perhaps in most) the private room was situated at the other end of the house from the services.

Normally these three units were set end-to-end along the axis, the whole house measuring perhaps 12 to 15 feet wide by 25 to 30 feet (or more) long. Frequently, however, one of the end rooms would be placed crosswise, giving a T-plan overall; others placed both end units in this fashion, an H-plan. Cross wings afforded more commodious accommodation and were sometimes the hallmark of gentry houses. Wealthier gentlemen required additional quarters, for guests, retainers, and servants; by the 14th century these were often arranged around a courtyard with the three-unit, cross-passage range occupying one side, as was done in the colleges being built at Oxford or Cambridge.

Though such consistency of plan suggests a common derivation, it is not certain that this was the case. Some historians believe that the plan developed out of the primitive peasant “longhouse,” where humans and livestock lived

under the same roof, the dwelling (sometimes divided into two parts) divided from the byre or shippon (a cowhouse) by a cross passage, sometimes equipped with screens. According to archaeological evidence this house type appears to have prevailed over much of England around 1300, although by the later Middle Ages it was restricted to smaller areas on the highland fringes of Devon and Wales. More prosperous peasants, better able to exploit the market, built specialized agricultural structures, while extending their houses to reflect the shape and plan of their predecessors, an interesting example of cultural conservatism. Poor peasants, however, probably lived in insubstantial one- or two-cell houses.

On the other hand the distinctive three-unit, cross-passage plan that had emerged by the later Middle Ages might well have been a conscious statement of status on the part of richer peasant farmers and minor gentry modeled on noble rather than longhouses: an instance of cultural diffusion downward from aristocratic precedents. In the 11th and 12th centuries the various discrete elements of a noble dwelling—a separate hall, kitchen, retainers' hall, private rooms, chapel, and other such areas—gradually coalesced; by the 13th century many of these separate buildings had become rooms, now attached to the hall range. Whatever the origins of the standard pattern it seems to have been firmly established by the 14th century.

We accept that a certain level of prosperity must be reached before a family could build a permanent house (i.e., one able to last for several generations). William G. Hoskins's seminal work (in 1953) and the debate that followed deeply influenced the study of medieval domestic building. He argued for a strong correlation between peaks of prosperity and increased building activity. Criticisms of Hoskins's dating for the "rebuilding" underlined the scale of regional variation. A number of earlier "great rebuildings" emerged; in Devon and Kent, for instance, there was a marked upswing in house building between ca. 1480 and 1530, corresponding to the increasing buoyancy of the local rural textile industries. Poorer and more remote areas, such as parts of Cornwall and the northwest, hardly reached levels of prosperity sufficient to sustain any widespread building of permanent houses, while in parts of Oxfordshire and Essex (with a proximity to the London market), the first "great rebuilding" can be placed even earlier, in the late 13th and early 14th centuries.

Numerous interrelated factors, such as soil fertility, the location of rural industries, access to markets, and tenurial patterns, all played a part in determining levels of building activity. Equally, postmedieval developments may be of great importance in shaping the distribution pattern of surviving medieval houses. A downturn in postmedieval economy could favor the retention of older houses; conversely, increasing prosperity could lead to widespread rebuilding and erase or conceal substantial houses from the earlier

period. While medieval houses form a valuable source for historians, like most classes of evidence they are liable to distort the picture if used in isolation.

Rates of survival also depend on the means of construction. The 13th century saw considerable improvements in building techniques, presumably in response to increasing demands from gentry and prosperous peasants as well as nobles and ecclesiastics. Building methods show enormous regional variation and were dependent upon the local availability of materials. Only the very wealthy could afford to import bulky goods from farther afield; even so, peasant demand stimulated craftsmen, such as carpenters and smiths (to provide nails and hinges), and brought into being specialist firms of house builders who prepared timbers in a framing yard whence they were transported for assembly on site.

The most widely used materials were stone and timber, but where these were not easily available even gentlemen would build in mud (as in Devon). Box- or post-and-truss framing techniques (using large posts, ties, and principal trussed rafters) predominated in the lowland areas, whereas cruck framing (using pairs of heavy timbers from, or close to, ground level and meeting at or near the roof apex) was commonest in the highland zone. In both methods survival of the materials was ensured only when the timbers ceased to be placed immediately on the ground, where they were vulnerable to damp rot, and were raised on pad stones or sill beams that rested in turn on stone. This improved method appears to have become widespread in the 13th century and helps account for the rarity of surviving houses prior to this.

Timber buildings, especially when thatched, were vulnerable to fire in nucleated settlements and towns. Closely packed town houses were often divided one from another by fire-resistant stone walls. However, in other respects town houses did not differ from those in rural areas as much as might be expected. Many boroughs were not densely populated, and houses frequently conformed to the prevalent three-unit, cross-passage plan. Where pressures on land were higher, or boroughs were planned from the start, such houses might be aligned end-on to the street.

Toward the end of the 13th century some towns were developing highly specialized retail and service functions that resulted in variants on the normal patterns. Shops facing the street (with stalls secured by shutters) might have private accommodation above and an open hall to the rear. Secondary structures would be placed to the rear. In some cases it seems that cooking facilities were minimal; it is possible that food was cooked elsewhere, perhaps in neighboring bakeries, as is still the practice in some parts of southern Europe. Intense demand for retailing could lead to shops being provided at two levels along the street, but evidence for this survives only at Chester, and the Rows system may result from the peculiarities of the Roman urban topography

rather than the extraordinary demands of the market. Normally, it seems, increased retail demand led to subdivision of tenements along the street frontages, with workshops and other ancillary buildings placed at the rear.

Architecture, University and College

Oxford and Cambridge trace their origins to the 12th and 13th centuries. While students attended lectures in university buildings and in rented spaces, living arrangements were made on their own, except for those who lived in monastic houses. At first students lodged with townspeople, but soon hostels became common; these were buildings rented by groups of students and used for sleeping and eating. The university corporation, consisting of a group of male teachers, owned or rented facilities for meetings and ceremonies, schools for teaching, and a library.

By the late 13th century colleges began to make their appearance as permanent establishments endowed by benefactors, often for poor students, with specific regulations of discipline and study. The earliest perhaps was

Merton College, Oxford, founded in 1264. While it was not planned like a monastic cloister, the buildings are arranged in an unconnected manner around a quadrangular court: a collegiate church occupies the west side, the hall stands detached on the south side with the warden's lodgings, and some other buildings stand on the east and north sides. Most commonly colleges provided lodging and meals for masters only, not undergraduates. Books were kept in their chambers in locked chests, and devotions were usually held in the local parish church.

The builders of early colleges usually built slowly and piecemeal around the perimeter of small lots, ultimately achieving the maximum building space per acreage. This practice often resulted in misshapen quadrangles, revealing that patrons had little concern for architectural regularity. As new colleges were founded and existing ones expanded, urban space—constricted because of town walls—became scarcer and thus more costly, while a desire grew for larger quadrangles and more uniform architecture.

Corpus Christi College, Oxford (built 1352–7, was perhaps the first college to be planned around a close quadrangle with buildings all the same height. The hall, Kitchen, and master's lodge were on the south and chambers with the other three sides. It had no chapel. At Cambridge the first closed quadrangle, containing all the requisite buildings, was that of Pembroke College, begun in 1346.

New College, Oxford ([fig. 9](#)), built 1379–86, set new standards for collegiate architecture. Its founder, William of Wykeham, took a personal interest in its physical layout; planned with utopian vision and quickly built, the buildings were designed by his master mason, William of Wynford. The whole ensemble was given monumental character, and, since it made provision for all college functions—chapel, hall, library, treasury, warden's lodging, sufficient chambers, cemetery, and various domestic offices—it came to serve as the model for all later large foundations at Oxford. Its buildings were arranged around an enclosed 150- by 125-foot quadrangle, entered from the west side through a tower gateway, which is employed here for the first time. The west and south sides are devoted to chambers; the east side to rooms of common use. The upper floor contains the library, the lower the bursar's rooms. The chapel and hall were built as a great unified block on the north side. A transeptal-shaped antechapel occupies the western two bays of the seven-bay chapel. This was used for disputations in civil law, canon law, and theology. This unusual T-shaped chapel plan was later used in Oxford, but not Cambridge. The butteries and kitchen are in a wing that runs eastward from the hall into a courtyard external to the quadrangle. Westward from the whole of this group a cloister cemetery was laid out with a bell tower on its side. The practice of placing chapel and hall together in a monumental block along one range of a

quadrangle was adapted in the 15th century in Oxford at All Souls (begun 1437), St. John's (begun 1436), and Magdalen (begun 1473) colleges; this strategy was, however, not used in Cambridge.

Fig. 10. Oxford Divinity School, pendant vault. Courtesy of L. Hoey.

The next two centuries witnessed about eighteen more colleges founded at Oxford and Cambridge, for the most part following the basic pattern laid down at New College, both in organization and quadrangular arrangement. Colleges that were founded earlier rebuilt their buildings to conform to the new arrangement.

While the precise locations of the various functions around the quadrangle are not canonical, it was common to locate the chapel on the north side, especially in Cambridge, and use the warmer, southern side for chambers. The chapel was placed on the side of the quadrangle that lay nearest to the east-west direction for religious reasons. The eastern wall of the chapel usually was left free, so a window could be placed there. The quadrangle gateway was usually placed on a street, but occasionally entry was gained through a parish churchyard. Many colleges had subsidiary or special-function quadrangles.

There are several reasons for the use of the quadrangle in English colleges. Although college “programs” were similar to monasteries—unmarried men, working and living together under a rule or body of statutes—and the disposition of buildings in courts have their analogies with monastic architecture, collegiate architecture does not directly derive from monastic architecture. A similar pattern is seen in the great houses of the 15th century, which often included a chapel among the buildings arranged around the

quadrangles. Most important, the enclosed quadrangle functioned as defense against potential enemies, especially townspeople. The closing of the college with gates also gave academic authorities greater control over students, a concern that was a major factor in the growth of the collegiate system.

One of the most thought-out college programs was that for King's College, Cambridge (ca. 1446), which included, following Wykeham's precedent, a cloister cemetery. In 1448 Queens' College, Cambridge, was founded. Built around a closed quadrangle, the chapel and library are on the north side, the hall, kitchen, and butteries on the west, and chambers on the south and east. The material of construction is red brick. St. John's, Cambridge, begun 1511, is also notable for its redbrick construction.

Arising out of a national concern for the building of libraries, one of the most magnificent university buildings built was the Oxford Divinity School (1424–83), which has exceptional pendant vaulting in its lower story ([fig. 10](#)); the upper story was to house the celebrated manuscript collection of Humphrey duke of Gloucester.

In the mid-16th century a new innovation in quadrangular design appeared with the building of Gonville and Caius College in Cambridge: it was open on one side, bounded only by a wall and a monumental gate. It is this new pattern, which created the possibility of focal points and axial organization not inherent in the closed quadrangle, that was to influence collegiate design in America.

Architecture and Architectural Sculpture, Gothic

English Gothic architecture and architectural sculpture in many ways continue themes, styles, and trends begun in Romanesque art. In fact the transition from Romanesque to Gothic is gradual, with no clear division between the two. Architectural space gradually becomes more complex and architectural sculpture gradually becomes more naturalistic and spreads to cover more areas of the building. However, the compartmentalization that characterizes Romanesque architecture and the emphasis on surface ornament and surface effects that have characterized English art since the early Anglo-Saxon period survive in varying degrees throughout the Gothic. These survivals may be explained by the fact that English architects and artists never adopted the system or philosophy of the French style but only bits and pieces of the style, adapting them to their own tastes and traditions. Thus English Gothic architecture remains long, low, and somewhat heavy in comparison with that of France, and the relationship of sculpture to architecture is less fully articulated. In England sculpture often seems applied to, rather than an integral part of, the architectural program. It is important, however, to stress that English Gothic should not be seen as a poor cousin to French Gothic. It is a highly innovative response to international and national trends, designed to accommodate a different set of tastes, practices, and requirements.

English Gothic can be divided stylistically into four periods: 1) a Transitional period beginning ca. 1175 and lasting until the early 13th century; 2) the Early English style lasting from the early 13th century to ca. 1290; 3) the Decorated style ca. 1290-ca. 1350; 4) the Perpendicular style ca. 1350 through to the Reformation. While chronology and the defining characteristics of each of these periods have been changed and refined over the years, these basic divisions are those established by Thomas Rickman in his 1817 *An Attempt to Discriminate the Styles of English Architecture from the Conquest to the Reformation*.

Transitional Style (ca. 1175–early 13th century)

The initial spurt of building in the immediate post-Conquest period was followed by a pause in new programs and then a renewal ca. 1175, as new influences, particularly from the Ile-de-France, made their way into England. In the years 1174–75 the new style appears in the southeast in the choir of Canterbury Cathedral, in the southwest at Worcester Cathedral and Keynsham Abbey, and in the north at Ripon and Roche Abbey. The regionalism suggested by this division would remain a feature of English Gothic.

The Canterbury choir is perhaps the most famous of these early Gothic structures. Begun by the Frenchman William of Sens, it is also the most French in style, with sexpartite vaults and elegant carved foliate details. Yet even here the style is transformed by the English love of linear pattern and the retention of the English thick wall. The dark Purbeck “marble” (a type of limestone) shafts and the short responds of the vaults create a rhythmical light-and-dark pattern; along with the alternating octagonal and circular piers, they also serve to stress the horizontal layers of the structure rather than its overall architectural unity. The plan itself, with its two transepts and axial chapel, is also English. The increasing elaboration and rise in the level of the interior indicate the increasing liturgical importance of the spaces of the east end from choir to presbytery (fig. 35: see CANTERBURY CATHEDRAL) to the Trinity Chapel in which Becket’s relics were displayed. Becket’s martyrdom ensured the cathedrals lasting influence, although outside of southeastern England much of Gothic architecture is characterized by rejection rather than adaptation of the style introduced at Canterbury.

In the west of England linear patterns and dark-light contrasts were created through the use of complex supports in which the pier is surrounded by a thick cluster of shafts, as at Worcester (after 1175) or Wells (1180–90; fig. 146: see WELLS CATHEDRAL), rather than by the use of dark marble. The wall surfaces themselves remain relatively unadorned, stressing the massive English thick wall. At Wells the clerestory is expanded so that it is almost equal in height to the arcade, and the vault responds stop at gallery level. The result is a dissolving of the bay unit and a stress on the horizontal divisions of the elevation that may look back to such Romanesque structures as Tewkesbury or Gloucester. Statues of eight Anglo-Saxon bishops were placed on the choir screen ca. 1200, possibly as a reminder of the history of the church, certainly as part of the growing promotion of English saints and their cults, a stress on national identity and history that transcended the regional divisions of style.

In the north a strong French influence is evident at Ripon Minster (begun ca. 1170) with its spacious arcade and slender supports, yet here too the thick wall,

clustered piers, and the original flat wooden roof were all in the English tradition. Churches in the north also showed a regional preference for lancet windows.

Architectural sculpture in the Transitional period is limited. Figural sculpture gradually increased in quantity and naturalism, but drapery remained stylized, conceived as patterns of folds that adorned rather than clothed the body. The figural sculptures from St. Mary's Abbey, York (ca. 1190–1200), are fine examples of this style (fig. 12: see ARCHITECTURE AND ARCHITECTURAL SCULPTURE, ROMANESQUE). Innovation occurs in West Country sculpture of ca. 1220–30. At Worcester Cathedral the spandrels of the transept and Lady Chapel are carved with a variety of figures (many restored). While clearly in the tradition of the Romanesque historiated capital, the poses, dress, and interaction of these figures are more complex and naturalistic. One scene in particular shows a monk inspecting the drawing of a cross-legged architect, giving us a glimpse into the more practical side of Gothic architecture. A similar sense of individuality and character is conveyed by the figural sculpture on the choir screen and interior capitals at Wells.

Early English Style (early 13th century–ca. 1290)

The 13th century saw the development of two main versions of Early English Gothic. The first version, found mostly in south and southeastern England, can be seen at Salisbury Cathedral (1220–68) and related buildings. Salisbury (fig. 118: see SALISBURY CATHEDRAL) is unique among English cathedrals in being the only cathedral begun on a new site, and this has often been seen as the explanation for its unparalleled unity of design. The individual elements of the structure do derive from a variety of sources—the use of Purbeck marble accents in the transepts from Canterbury and Lincoln, the four-part vaulting and horizontal layering from transitional southwestern architecture such as Wells—but unity is achieved through the harmonious repetition of the Purbeck marble details and the lancet windows. The compound shafts of Wells and Worcester give way to restrained four-shaft piers in the nave, changing to eight-shaft piers in the choir, the change possibly indicating the increased liturgical importance of the choir. The low gallery level may look back to the Romanesque. The unity of interior space continues in the Lady Chapel, where slender piers and side aisles equal in height to those of the nave create an open space and diaphanous structure.

The second, and more elaborate, strand of Early English architecture is exemplified by Lincoln Cathedral (1191). Here, as at Salisbury, the English

thick wall survives but is joined, particularly in St. Hugh's Choir (begun 1191), by rich polychrome effects and sculptural ornament in the Canterbury tradition. The capitals throughout are covered with stiff-leaf foliage, the piers vary in design, and the profiles of the moldings and piers are rich and complex. In St. Hugh's Choir the aisle walls are ornamented with arcading and angels emerging from thick banks of clouds. The choir is crowned by the famous Lincoln "crazy vaults." The asymmetry of these vaults and the introduction of the ridge-rib work to dissolve the compartmentalization of the bay unit, but it should be noted that the traditional longitudinal emphasis of English architecture had been working toward similar ends for quite some time. Both Lincoln and Salisbury display the rectangular choirs and flat east ends that typify the English Gothic and that have their ultimate origin in Anglo-Saxon architecture.

The 13th-century chapter house at Lincoln ([fig. 38](#); see CHAPTER HOUSES) was as influential as the cathedral itself. It was the first of the great English chapter houses to be vaulted with a fan of ribs supported by a single slender column, like an inverted umbrella. The centralized plan of the English chapter houses distinguished them from their continental counterparts.

During the 13th century changes in the liturgy requiring an expansion of processional space led to an increasing complexity in the design of the east end of the church. Often this corresponded with the promotion of the cult of a local saint, as at Durham, where the chapel of the nine altars was constructed to house the shrine of St. Cuthbert in the 1240s.

Sculpture in the Early English period continued to spread across the interior and exterior surfaces of the church. The profusion of sculptural details applied to the interior of Lincoln Cathedral became a characteristic of English sculpture by the end of the 13th century. The marginal spaces of the church—capitals, corbels, bosses, etc.—became the locus of sculptural innovation, with narrative scenes giving way to elegant floral or foliate motifs or single inhabiting figures. The monsters and genre scenes that decorated these areas during much of the Romanesque period began to appear in yet more marginal areas, such as misericords. A fine example of an early-13th-century misericord decorated with dragons and foliage survives at Christchurch Priory, Dorset.

The period is dominated by two separate "schools," the first in the West Country centered on Wells and the second in London, with Henry III's Westminster Abbey as its major monument. By the middle of the 13th century traveling workshops comprising lay sculptors had emerged. Increasingly their names are preserved in contemporary documents.

The screen facade of Wells Cathedral (1230–50) is a prime example of West Country work ([fig. 122](#); see SCREEN FACADES). Here architecture becomes little more than a setting for figural sculpture. The portal itself is deemphasized so

that the facade becomes a great gateway under which we must pass to enter the church, the kingdom of heaven on earth, a foreshadowing of the entry of the saved into the heavenly Jerusalem. The Virgin occupies the central axis; in the tympanum over the door is the Virgin and Child, and above the portal the Coronation of the Virgin. The niches and quatrefoils are populated with statues of the resurrected, prophets, martyrs, confessors, angels, apostles, and scenes from the Old and New Testaments, capped by the large central Christ in Majesty (a modern replica). Originally the whole facade would have been brightly painted, resembling a giant altar screen, so that entry into the sacred space of the church became a literal echo of entry into the even more sacred space of the east end, and a symbolic echo of entry into paradise.

Stylistically the sculpture shows a strong French influence. The figures are monumental and elegantly dressed, with folds of drapery clearly relating to the bodies beneath. Poses are restrained and naturalistic, and faces carved with a sense of individuality free from all Romanesque distortion. The work and/or influence of the Wells workshop are evident in sculpture at Bristol, Hereford, and Salisbury and in Scandinavia.

An even greater French influence is evident at Westminster Abbey (1240s), where Henry III (and then Edward I) adopted the Rayonnant style associated with French royal patronage. Westminster Abbey ([fig. 147](#): see WESTMINSTER ABBEY) was intended to serve as mausoleum, coronation church, and royal chapel, and Henry's architects combined elements of the three French churches that served these same functions—St. Denis, Reims, the Ste. Chapelle—in its design. The elaborate surface decoration of the interior, however, is in the English tradition; it included Purbeck marble detailing, carved arcading, corbel heads, foliage, rosettes, and painted diaper patterns. The monumental figure sculpture, which included the famous censing angels in the transept spandrels, marks the beginning of the highly influential London (or Court) School of sculptors.

Decorated Style (ca. 1290–ca. 1350)

The late Gothic Decorated style initiated a trend toward smaller, more ornamental structures. The increasing laicization of society brought church, crown, and lay culture closer together. Not surprisingly a significant amount of artistic innovation took place within parish churches and secular structures. The slender piers and large windows that first appear in mendicant (i.e., friars') churches are quickly translated into the design of parish churches (e.g., at Boston or Hull) and the chapels and chapter houses of the great cathedrals. A desire for personal display at all levels of society resulted in the multiplication of private funerary chapels, elaborate tombs, and shrines capped by ornate canopies and gables, and a proliferation of luxurious and costly reliquaries. The architecture, sculpture, and metalwork of the period exhibit a common vocabulary of style and motif, perhaps best exemplified in works associated with Edward I (1272–1307). The Eleanor crosses, erected after the death of Edward's queen and based on French prototypes, straddle the line between monumental sculpture and miniature architecture, while displaying the delicate jewellike decoration of metalwork.

The buildings erected at this time are characterized by an emphasis on decoration and artistic inventiveness at the expense of structural and architectural innovation. The architect employed in Edward's rebuilding of St. Stephen's Chapel (1292–1348) at Westminster, Michael of Canterbury, also worked on the Eleanor crosses and incorporated many aspects of their design into the new structure. While the basic plan of the chapel is based on that of the Ste. Chapelle in Paris, the elaborate tracery of the canopies of the wall arcading, the ogee arches of the window tracery, and the ogee-reticulated tracery of the east cloister (ca. 1300) all derive from the crosses. The vault of the lower chapel is among the earliest examples of a lierne vault, in which short, decorative ribs run between the diagonal ribs, and an example of the innovative tracery patterns that became one of England's greatest contributions to late Gothic style.

After St. Stephen's Chapel the key monuments of the Decorated style are Exeter (1280 to the late 14th century) and York cathedrals, the choirs of Lichfield and Wells (1320–40), the Ely octagon (1322–24), and the cloister at Norwich. The rebuilding of the east end of Wells Cathedral has been attributed to the general desire to "gain greater privacy for the liturgical choir by transferring it from the crossing to the east arm," evident throughout England in the 13th and 14th centuries (Wilson, 1990: 199). This increased desire for

more private space and the proliferation of ornament within it are also part and parcel of the increasing mysticism and concentration on personal devotion that characterized the late Gothic period throughout Europe (as are the increased numbers of private chapels and monumental tombs).

The polygonal Lady Chapel at Wells is covered with an unusual domed vault decorated with a star-shaped pattern of tracery that emphasizes the chapel's centralized space. To the west of the Lady Chapel are four smaller chapels, two forming a miniature transept, and an ambulatory that makes the transition between the complex of chapels and the high east wall of the choir. The visual and spatial effects of this arrangement are complex. Looking through the arches of the east wall of the choir (originally blocked by a canopied screen), the chapels appear to be straightforward rectangular extensions of the choir; but within the ambulatory and chapels proper the thin supports and elaborate tracery patterns of the vaults and windows mold the interior into a series of distinct but interconnected spaces. The decorative tracery patterns of the chapel vaults are continued on the tunnel vault of the choir, where they echo the tracery patterns of the great east window.

Church furniture, wooden sculpture, and wooden construction became increasingly important in the first half of the 14th century. Decorative gables, ornate versions of those decorating the Eleanor crosses, covered choir screens and stalls, as on the 1308–10 choirstalls at Winchester, or the Exeter bishop's throne (1313–17). The narrative and anecdotal context of both misericords and roof bosses expanded (as at Wells), probably under the influence of manuscript illumination. In general these "marginal" images are carved with the same delicate style seen in monumental stone sculpture.

The Ely octagon, begun by the royal carpenter William Hurley after the collapse of the Anglo-Norman crossing tower in 1322, might be described as a canopied choirstall blown up to monumental proportions, as the liturgical choir and stalls were originally located directly beneath it. A technical masterpiece, it consists of an octagonal timber lantern supported by an octagonal masonry base. The lantern was originally painted to give the illusion that it too was built of stone. It functioned both as a bell tower and as a means of concealing the massive timber supports of the vaults.

On the exterior surfaces of early-14th-century churches and cathedrals the relationship between architecture and decoration was not as harmonious as it was on the interior. The screens of canopied niches filled with figural sculpture that cover the entrances of St. Mary Redcliffe, Bristol (1320), or Exeter Cathedral (1350–65) no longer follow the vertical and horizontal lines of the structure, as they did at Wells (1230–40), but conceal architectural form beneath an applique of surface ornament. Indeed at Exeter the sculpture dominates its architectural setting. The Exeter figures also exhibit a stiffness

and crudity of carving, possibly linked to the economic and social upheavals resulting from the Hundred Years War and the Black Death (1348–49).

Perpendicular Style (ca. 1350–1525)

The Perpendicular style takes its name from the narrow arched rectangular panels created by the tracery that covers both the walls and windows of late-14th- and 15th-century structures. It first appears in the south transept and choir of Gloucester Cathedral (1351–67), where the east wall of the choir is dissolved into a curtain of glass visually united with the masonry walls by an all-over grid of tracery. The verticality of the space is heightened by the pier shafts and the responds, which descend uninterrupted from the high vault. The colors used in the great east window are restrained and the figures worked in near grisaille (almost monochrome grey), suggesting a wall of sculpture that adds to the overall unity and harmony of the choir. Carved decoration is limited to the arches of the tracery panels and the bosses and angels that decorate the elaborate lierne vault. The overall effect is restrained, almost ascetic, in comparison with the bright colors and lavish sculptural decoration of the Decorated style. It may be the result of a deliberate turn away from worldliness and ostentation in the wake of plague, war, and social upheaval.

The division of architectural surfaces into panels of tracery that begins in the choir is taken one step farther in the Gloucester cloister. The east walk of the cloister is roofed with the earliest known fan vault, a vault consisting of projecting masonry cones covered with a pattern of blind tracery ultimately derived from the rose windows of Rayonnant architecture.

The Perpendicular style rapidly became popular throughout England. The decorative restraint and increased verticality of the Gloucester choir are evident in the high narrow arcades and unbroken vertical lines of the late-14th-century naves at Winchester and Canterbury. Monumental sculptural decoration is confined to tombs and to areas immediately surrounding doorways and altars.

The two great monuments of late Perpendicular architecture are both royal structures and reflect the splendor of court culture. St. Georges Chapel, Windsor (1475–1511), was built as a royal mausoleum and seat of the Order of the Garter for Edward IV. Architecturally the chapel is based on the plans of the great Perpendicular ecclesiastical structures, such as the Gloucester choir and the Canterbury nave; however, its shorter length and reduced height create an open interior that has much in common with contemporary great halls.

The last of the great Perpendicular buildings, Henry VII's Chapel at Westminster Abbey (1503–09), was also based on great church design and was intended to replace St. George's Chapel as the royal mausoleum. It too combines the traceried splendor of ecclesiastical architecture with the open space (and bay windows) of the great hall. On the exterior the sides of the building consist of alternating polygonal bay windows and masonry buttresses divided into narrow vertical panels of tracery. The turrets end in pinnacles with niches that originally held statues of apostles and prophets, and are capped by elaborately crocketed onion domes. The interior of the chapel is covered with delicate tracery and sculptural decoration, but its greatest glory is its high pendant vault, which seems to hang like a web from the great transverse arches. The illusion of weightlessness is amplified by the high profile of the tracery that causes the solid masonry to dissolve in shadow.

The figures of prophets that survive from Henry VII's Chapel are as remarkable as the architecture. Their deeply carved draperies and elaborate hats create strong patterns of light and dark akin to those of the vault. Moreover their highly individualized faces, postures, and dress create a sense of personality that foreshadows developments of the later 16th century. Taken as a whole Henry VII's Chapel and its sculpture provide a fitting swan song for the English Middle Ages.

Architecture and Architectural Sculpture, Romanesque Architecture

The development of Romanesque architecture in England is inextricably linked to the Norman Conquest of 1066 and the church reform of the 11th and 12th centuries. Both the new political dynasty and the new religious orders demanded the construction of new buildings designed to impress through their strength, size, and beauty (not to mention the labor necessary to complete them). The massive walls, imposing towers, and enormous size of both castles and churches were the ideal symbols of king and Church Militant.

Edward the Confessor's church at Westminster Abbey (begun ca. 1050) is frequently cited as the first true Romanesque church in England. Though built before the Conquest, it was Norman rather than English in style, with towers at both west end and crossing and a spacious nave. Its scale, however, was unprecedented in either country. It served as both the shrine for Edward's relics and as coronation church for William, an apt symbol of the merging of Anglo-Saxon and Norman traditions in the English Romanesque.

English Romanesque architecture was brought to maturity in the 1070s with the construction of St. Augustine's Abbey and the cathedral at Canterbury under Archbishop Lanfranc. Modeled on the church of St. Étienne at Caen, where Lanfranc had been abbot, Canterbury Cathedral had a typical Romanesque plan: two-towered facade, long nave with side aisles, pronounced transepts with side chapels, crossing tower, and choir and apse for use by the clergy. The elevation consisted of arcade, gallery, and clerestory levels. The repetition of the bay unit within the church served both to compartmentalize space and to create a harmony of arched forms. Lanfranc's Canterbury was clearly not a mere copy of St. Étienne. The clerestory at Canterbury does not seem to have included a wall passage (as at Caen), and Canterbury has a crypt, while Caen does not. The remains of the large Anglo-Saxon cathedral were discovered in 1993 beneath the present nave. While the excavation reports

have not yet been published, the sheer size of the building may indicate that Lanfranc's Canterbury had more in common with its Anglo-Saxon predecessor than has previously been suspected.

The tradition begun at Canterbury was quickly transformed as it spread throughout England, and regional schools of architecture soon developed in the west Midlands, Lincolnshire, Hampshire, Yorkshire, and Northumbria. These schools combined the Norman plan and elevation with influences from Germany, Italy, Scandinavia, and Anglo-Saxon England.

Perhaps the most distinctive regional school was located in the west and southwest Midlands. The abbey churches of Tewkesbury (begun 1092) and Gloucester (now the Cathedral, begun 1089; [fig. 68](#): see GLOUCESTER CATHEDRAL) are fine examples of this style. The interiors of these churches tend to break up the compartmentalization of the bay unit. At Gloucester the monumental columnar piers of the nave rise to such a height that the gallery level is reduced to a band of decorative arcading. While less graceful than the triforium of the Gothic plan, the longitudinal emphasis created by the gallery at Gloucester looks forward to the linear articulation and longitudinal emphasis of Salisbury Cathedral ([fig. 118](#): see SALISBURY CATHEDRAL).

Monumental columnar piers are also present at Durham (begun 1093) in the north of England though here they alternate with compound piers, and their imposing bulk is softened somewhat by the enormous size of the church (modeled on Old St. Peter's) and by the geometric patterns carved into their surfaces. The interior of Durham is beautifully articulated by the sculpted details of arches, ribs, and label stops. Originally brightly painted, this interior represented a combination of early Christian forms with Romanesque style and the traditional English love of rich colors and surface patterns.

The western "galilee" at Durham, ([fig. 52](#): see DURHAM CATHEDRAL), added in the 1170s by Bishop Hugh le Puiset, served several functions. A porch or entrance chamber in English churches, the galilee is named after Christ's journey from Galilee to Jerusalem, a journey symbolically echoed by the entry of the clergy into the church from the galilee after the Sunday procession. The Durham galilee also housed the ecclesiastical court, an altar to the Virgin, and the relics of Bede. Durham was a high point of Norman influence in the north, yet as a shrine for both the relics of Bede and St. Cuthbert (enshrined in the central apse in 1104) it was also a symbol of the Anglo-Saxon tradition.

Some of the most unusual churches were built in the north, particularly in Yorkshire and Northumbria. The Romanesque cathedral at York (begun ca. 1080 by Thomas of Bayeux) was aisleless. In the east end the presbytery (eastern portion of the chancel) was constructed as a cell separated from the surrounding shell of the outer walls by two narrow corridors. These lateral corridors may have been connected by a passage separating presbytery from

apse. Relatively little remains of the structure of this east end, but it does seem to have been unusually long. Piers in the 12th-century undercroft at York are carved with decorative surface patterns similar to those found on the nave piers at Durham.

Piers carved in the Durham manner can also be seen in the nave of the Benedictine priory church at Lindisfarne (reestablished ca. 1082 as a cell of Durham). Like Durham, Lindisfarne also had a stone vault, and it is likely that both churches were built by the same group of masons. Unlike Durham, Lindisfarne had an aisleless choir and a shallow transept with an apse on the east side of each arm. The most unusual feature of the church, however, was its facade, described by McAleer (1984: 614) as a “quasi-screen” facade. The west front at Lindisfarne presents us with a screen of masonry divided by stringcourses (horizontal bands forming part of the design) into four levels and flanked by projecting stair towers. At the center is a projecting porch decorated with chevron ornament and flanked by blind arcading. The porch may originally have had a gable roof and contained a small gallery. The gable that currently crowns the whole of the west front dates to the 14th century. This type of facade is an original English feature and looks forward to the full-blown screen facades of the Gothic.

One of the most impressive of all Romanesque churches is Lincoln Cathedral (fig. 82: see LINCOLN CATHEDRAL), begun by Bishop Remigius between 1070 and 1092. The plan of the church was similar to that of Canterbury, the major difference being the addition of an imposing westwork. The western facade at Lincoln is not simply a screen but a massive block designed to resemble a fortified castle. Indeed the west end of the cathedral faced the local castle just across Ermine Street.

The surface of the facade is pierced by three great triumphal arches, a feature also found in contemporary castle architecture (as well as at Tewkesbury). As was the case with Durham, this church was meant to be a statement of Norman power. The three arches of the facade beautifully sum up the amalgamation of political and religious power that the church was designed to represent. They remind the viewer of military architecture and Roman triumphal arches, but they also echo the interior space of the cathedral, specifically the three great arched openings at the entrance to the east end.

The proximity of church and castle seen at Lincoln is by no means unusual. Quite often male religious houses and castles were built in close proximity to each other, a unified statement of domination over the surrounding landscape. Until recently women’s houses in Romanesque England have not received much study, perhaps because we have assumed that gender had no significance when it came to the construction and decoration of monastic buildings; however, Roberta Gilchrist (1994) has demonstrated that this is not the case.

While there were exceptions, women's houses tended to be built in marginal areas, on agriculturally poor land, and were rarely built in proximity to castles—that is, they were not used to make political statements in the same way that men's houses were. Women's houses also tended to be more sparsely decorated, though some of the more important houses, such as Barking or Romsey, are significant exceptions. Although the evidence is fragmentary, scenes like the Coronation and Assumption of the Virgin in the northern tympanum of the church at Quenington, Gloucestershire (ca. 1150), suggest that women's houses might also have had their own iconography.

Sculpture

While many Anglo-Saxon churches were decorated with sculpture, it is only in the Romanesque period that architectural sculpture becomes fully integrated into the fabric of the building. Beginning around doorways, windows, and the capitals of columns in the early Romanesque period, sculptural decoration soon spread to articulate and embellish the whole of the building. However, sculpture in medieval England almost always remains surface ornament, decorating architectural forms rather than creating its own space. Unfortunately, as is the case with Anglo-Saxon sculpture, much of the material, particularly figural sculpture, was damaged or destroyed by 16th- and 17th-century iconoclasts, or disappeared during remodeling or rebuilding campaigns. As with architecture English Romanesque sculpture is eclectic, influenced by Anglo-Saxon, Scandinavian, French, German, Italian, and Byzantine art, yet combining these influences to create a new and highly expressive style.

Within the monastery the church, chapter house, and cloister received the most elaborate decoration. The walls of the 12th-century chapter house at St. Augustine's, Bristol, are decorated with interlaced blind arcades, while the ribs of both arches and vault are carved with beading and chevron ornament. Arcading also decorates the walls of the chapter house at Gloucester, a structure perhaps best known for the rich chevron ornament surrounding its doorway.

In the cloister the capitals of the arcade could receive lavish decoration. Particularly fine capitals survive from the cloisters of Glastonbury Abbey (ca. 1150), Hyde Abbey, Winchester (1125–30), and Norwich (1130). A variety of ornament was used, from foliate motifs and grotesques, as at Hyde Abbey, to figural narratives (historiated capitals), as at Norwich. The piers of the cloister could also be decorated with figural sculpture. It has been suggested that the

reliefs of Sts. Peter and Paul from Ivychurch Priory, Wiltshire, might have been used in such a manner, though there is no solid evidence that this was the case.

The interior spaces of the church were frequently articulated by chevron or other types of geometric ornament applied to arches, moldings, and ribs. Label stops and corbels were enriched by human or animal heads. Durham Cathedral provides a particularly fine example of a fully articulated Romanesque interior. Sometimes, as at Durham, simple cushion or cubic capitals were used, with designs often painted onto their flat faces. Perhaps this practice helps to explain the similarity in style and iconography between many of the carved capitals and contemporary manuscripts. Capitals at both Westminster Hall and the crypt of Canterbury Cathedral, for example, have parallels in initials from Canterbury manuscripts as well as motifs found in the borders of the Bayeux Tapestry. It should also be remembered that at least some Romanesque artists were able to work in a variety of media. Master Hugo, the innovative illuminator of the Bury Bible (Cambridge, Corpus Christi College 2) was also a sculptor and a metalworker. Capitals of columns and responds, as well as label stops, could be carved with a variety of motifs from Corinthian acanthus to fabulous beasts and narrative subjects. While there is no rigid chronological development from simple cushion capital to historiated capital, it is generally true that narrative scenes became more popular and more complex over the course of the 12th century.

Exterior sculpture is concentrated around doorways, though corbel tables and stringcourses were also carved with ornament similar to that of the church interior. Grotesque human or animal heads were particularly popular on corbels, and probably had an apotropaic (evil-averting) function.

The reign of Henry I (1100–35) saw a flowering of sculpture due largely to wealthy patrons, such as Henry, his daughter Empress Matilda, and Bishop Roger of Salisbury, as well as the growing influence of Cluny. Already regional styles were beginning to emerge. The influence of the Scandinavian Ringerike and Urnes styles is evident in and around areas of Scandinavian settlement, such as Cumbria and East Anglia. Sculptors in these areas worked in a flat, highly patterned style, and were particularly fond of animal motifs, many of them derived from Scandinavian mythology, or the traditional iconography of combat (e.g., the boar tympanum of St. Nicholas, Ipswich). Dragons or serpents are frequently depicted in battle—with each other, with human beings, with St. Michael—and are probably meant to symbolize the battle between good and evil.

Royal patronage continued to play an important role in the development of Romanesque sculpture during the reign of Stephen (1135–54). The king is particularly associated with his foundation of Faversham Abbey in Kent (1148), built to house the royal mausoleum. Although only fragments have survived,

the Faversham sculpture provides some of the earliest examples of the use of Purbeck marble.

Even more significant as a patron was the king's brother Henry of Blois, bishop of Winchester and abbot of Glastonbury, whose economic and aesthetic interests opened the door to a wide variety of continental influences. It was Henry who popularized the use of Tournai marble for fonts, grave slabs, and architectural details in England. Not only were objects and unworked marble imported, but the Tournai style itself had a significant, though localized, influence in England. The lush foliate ornament decorated with chevrons and beading of the capitals surviving from the cloister of Glastonbury Abbey have parallels with capitals in Tournai Cathedral. Fragments of the door jambs from Wolvesey Palace, Henry's residence at Winchester, show the influence of Abbot Suger's St. Denis. Henry's collection of classical sculpture, purchased in Rome in 1151, has also been credited with influencing the great plasticity and naturalistic forms of the centaurs decorating surviving capitals from Winchester Cathedral.

Fig. 11. Lincoln Cathedral, west frieze, "Sodomy" panel. Drawing by C. Karkov.

Artistic patronage and political ambition were closely linked in the mid- to late 12th century. Patronage, particularly when it involved artistic innovation, was a sign of the wealth and prominence of a community. Henry of Blois had been educated at Cluny and no doubt desired his own houses to reflect some of Cluny's style and grandeur. The similarity of the Wolvesey Palace jambs to those at St. Denis suggest that he emulated, or even saw himself in competition with, Abbot Suger. Alexander "the Magnificent," bishop of Lincoln (1123–48),

emulated both Henry and Suger. Alexander rebuilt Lincoln Cathedral, adding a stone vault, sculpted decoration to the doorways, and a frieze to the western facade. Henry of Huntingdon boasted that Alexander had succeeded in turning Lincoln into “a strong church in a strong place, a beautiful church in a beautiful place: invincible to enemies as suited the times.” The narrative frieze is unusual in Romanesque England, though it does have parallels on the Continent (as at Selles-sur-Cher near Blois or Modena in Italy) as well as in Anglo-Saxon England (e.g., Hexham, Wearmouth, Breedon-on-the-Hill). The Lincoln frieze depicts both Old and New Testament scenes and, while it has no exact parallels, is similar in iconography to the sculptural programs of the Romanesque pilgrimage churches, although several of the scenes, such as the “Sodomy” panel ([fig. 11](#)), are unique.

Fig. 12. Moses, St. Mary's Abbey, York. Currently in the Yorkshire Museum. Reproduced by courtesy of the Yorkshire Museum.

Scandinavian influence continued well into the 12th century and is particularly evident on Hereford School sculpture, as at Kilpeck (ca. 1150), though here it is merged with continental influences. The grotesque beasts decorating the doorways of such churches as St. Peter, Aulnay-de-Saintonge

(ca. 1130), are assumed to have influenced the biting-beast heads on the voussoirs (the wedge-shaped pieces in an arch) at Kilpeck and other English and Irish churches, although an exact chronology is particularly difficult to establish. However, the ferocity of the English and Irish beasts and the way in which they grip the molding of the arch with prominent teeth and tongue are purely insular and can be traced back to such objects as the 8th-century Donore handle (National Museum of Ireland 1985:21 b, d, e) or the ca. 800 Book of Kells (Dublin, Trinity College A.I.6). The tiered figures of the chancel arch at Kilpeck are thought to have been influenced by similar figures at Santiago de Compostela, though the exact means of transmission remains hypothetical.

Sometime ca. 1150 carved roof bosses began to be applied to vaults. Peterborough Cathedral has some of the earliest (ca. 1150) and most interesting. The Peterborough bosses contain fantastical animals with heads and paws that bite and grip on to the ribs of the vaults—similar to the way in which the Kilpeck heads bite and grip the roll-molding.

Artistic links with the Continent expanded during the reign of Henry II (1154–89). Figural sculpture became both more popular and more three-dimensional at this time. Compare, for example, the relief of Sts. Peter and Paul (ca. 1160) from Ivychurch Priory, Wiltshire (a royal foundation), or the figural sculpture from St. Albans Abbey with the earlier Kilpeck figures. A love of rich surface pattern is still evident in the folds of the drapery and decorative details, but the figures themselves have a greater plasticity and more naturalistic sense of form and motion, and they make greater use of the effects of light and shadow.

The influence of Byzantine and Mosan (Meuse Valley) art also increased in the late 12th century. The York Virgin and Child of ca. 1155 derives from Byzantine models, while the life-sized apostles, prophets, and typological figures from St. Mary's Abbey, York (1180–85), are clearly influenced by Mosan metalwork (fig. 12). The surviving heads of the St. Mary figures show a fine sense of individuality, drapery falls in long heavy folds, and the poses display a classical weight shift. The exact position and arrangement of the York figures are unknown, but they are likely to have been arranged in tiers around the interior of the chapter house with New Testament apostles above Old Testament prophets and typological figures. Both the expanded use of large figural sculptures in an architectural setting and the increased classicism of the figures themselves point toward the naturalism and monumentality of Gothic architectural sculpture.

Armies and Military Service

Anglo-Saxon Armies

While many aspects of Anglo-Saxon military organization are subject to debate, it seems evident that the armies were national armies, and that normally all freemen were obliged to render some form of military service. The pre-Conquest military establishment, with roots in ancient Germanic society, pursued a path of development markedly different from that seen on the Continent, where increasingly, from the mid-8th century onward, heavy cavalrymen, the aristocratic knights of feudal society, emerged as the fundamental element in warfare.

The Anglo-Saxons instead remained committed to the infantryman. Although English warriors might ride to battle or in pursuit of the foe, they customarily dismounted and fought in the traditional shield-wall formation. The significance of this different development was reflected in the fact that prior to the Conquest English society was not based on the feudal structure, linked to knight service, as it was on much of the Continent.

Service in the *fyrð*, or national levy, together with work on bridges and borough defense, constituted the *trimoda necessitas*, the three forms of public burden imposed on all freemen and all lands by the throne. Initially the obligation of military service appears to have been calculated on the basis of each hide of land—seen as the amount of land required to support one family—turning out one man when summoned. In some regions service was naval rather than military. At some undetermined point in time, perhaps to realize a better quality of service, the obligation became that of one man from several hides, possibly from five. We lack clear evidence regarding whether the five-hide system was the basis of service in all regions or if it was a model or a political and military reality. In areas not neatly “hidated,” as in East Anglia or the northern Danelaw, other bases of assessment must have been utilized.

The *ceorls*, or free peasants, who made up the great *fyrð* are dim figures in descriptions of warfare found in the sources, a mere backdrop against which the professional warriors, the thegns (a hereditary class holding estates granted by the crown), and their semiprofessional retainers and mercenary soldiers, waged battle. Undoubtedly the average peasant was neither adequately trained nor equipped for the battlefield. It is also unclear if the *ceorl*’s military obligations required participation in distant conflicts. While in the 9th century they normally did not fight beyond their own shire, by the 11th century this had altered, though it is likely that the full *fyrð*’s primary military role remained local or regional defense.

On the other hand it is unlikely that the *ceorl* was a negligible factor in battle, as there is evidence that at least wealthier peasants possessed weapons and armor equal to those of less prosperous thegns. Nevertheless, the five-hide system may actually have constituted the basis of a select *fyrð*, a more efficient and better-equipped force composed of thegns, their retainers, on occasion mercenary troops, and more affluent peasants, in contrast to the general *fyrð* of all freemen.

Under any circumstances it was men of the thegn class and their retainers, or hearth men, who formed the efficient component of the military forces. Whether the obligations of thegns were, like those of the *ceorls*, based upon the hide system or on personal relations with their lord is open to debate.

Anglo-Saxon monarchs, as well as prominent thegns and magnates, took mercenaries into their service. Although constituting a small proportion of the

military forces, they served an important role as professionals on regular service. Æthelred II (979–1016), in his struggle with the Danes, employed Scandinavian mercenaries, such as Thorkell the Tall, who entered his service in 1012 with 45 ships. Under Cnut (1016–35) the corps of royal housecarles was established. Patterned after the Jomsvikings organized by his grandfather in Denmark, it was a guild of professional warriors with its own body of laws. These men, armed with battleaxe and sword, were the backbone of the Anglo-Saxon army until their virtual annihilation at Hastings. While many housecarles were landholders, their military service was essentially that of mercenaries based upon a regular stipend and personal loyalty to the king akin to the *comitatus*, or sworn warband, of ancient Germanic society. Many thegns and aristocrats also maintained mercenary retainers, of both English and foreign origin, variously designated as hearth men, *hiredmenn*, housecarles, *lithsmen*, or *butsecarles* (the latter two terms seemingly signifying those equally proficient on land or sea).

Armies after 1066

The fiefs that William the Conqueror granted his Norman and allied followers supplied the basic structure of English armies until the 14th century. Their tenure was by knight service; each fief was assessed at a certain number of knights calculated in round numbers of five, to serve for two months at the king's summons. The total service was about 6,000 knights.

This seeming symmetry did not last long, as the lack of heirs, division of land, and dowries produced fractions as low as one-sixteenth. Church tenants often preferred to pay scutage (shield money). Sheer neglect of service was met with heavy fines. Kings responded to begrudging and partial responses to military summonses by a policy of calling up some fraction of the total service owed by their tenants in chief; mostly they summoned their nobles. These men, an hereditary feudal core, became the recruiters and leaders of a quasi-professional force.

The details of a knight's military service lay more in the realm of custom than of written law. From 1181 the basic military obligations of all freemen, including fief holders, were spelled out in royal assizes, later codified as statute (Statute of Winchester, 1285; modified by further royal writs). Even after knight service lost its military priority, the king would fine men of sufficient property who did not accept their responsibilities: fines known as distrains of knighthood.

The army was mustered by royal writs addressed to tenants in chief and to

sheriffs in the counties (shires). The latter were mainly expected to raise the nonfeudal or subfeudal freemen, mostly as archers and spearmen. Small groups of more elite landholders came to oversee the raising of the forces, as a supplement to or replacement of the general service of lesser men under the supervision of the sheriffs. General military summonses, issued as commissions of array, were confined to armies called for service in the British Isles and to the lesser service of the archers and spearmen. In 1297 Edward I summoned all subjects with £40 of rent to serve in France, and he encountered resistance almost tantamount to rebellion. As late as 1346 general writs were still being issued, but not for service in France.

But it was in the great extension of the system of contract that the weaknesses of these arrays were solved. Contractual service has been traced back to the 12th century, but only in Edward I's reign was it used extensively in the raising of armies. In the conflicts of Edward II's reign both sides in the civil war raised troops in this way. It was Edward III who found the formula for raising troops, and techniques for using them, so as to stabilize his military forces at a sufficient size and level of leadership to help pave the way for the great victories in France.

Military contracts—known as indentures because the copy of each party was written on a single sheet and then separated by an indented cut—were of two principal types. Campaign indentures were usually for six months or a year. Others were for life. A campaign contract obligated the retainer to serve his lord with a given number of men-at-arms and (usually) archers for stated wages and other rewards. Usually there was a generalized commitment to serve when summoned rather than details of the muster. Wages and rewards were spelled out; for overseas war shipping was provided. As time went on, a share of ransom money among captor, retainer, and lord was defined in a “third and third of thirds” formula, so shares of ransom trickled upward. Life indentures helped back up and stabilize the fluid system of raising soldiers.

But the desired goals of victory abroad and peace at home depended much more on the person of the king than on the system. Nor should the contrast with “textbook” feudalism be exaggerated. Most of the contracting captains were already or became landlords with titles and chivalric notions. Neither did the size of armies change dramatically. Both sides at Hastings seem to have numbered about 7,000 fighting men. A single expedition or summons usually produced around 12,000 in Edward I's time and thereafter. A still larger force could be assembled, given time. The greatest English force recorded, over 30,000, was for the siege of Calais in 1346–47.

The supply of the armies was handled at first by commissioners exercising the royal right of “prise,” that is, the right to levy food and materials for royal use. This too was replaced in Edward III's time by contracts with merchants.

Contract was also extended to the levy of mounted archers who then operated in close cooperation with the knightly force in a mobile army that dismounted to fight and gave England her major victories.

Arms and Armor

Two major categories of arms predominated: those of the knightly class, which included men-at-arms (esquires or sergeants), knights, and noblemen, and those of the footmen, including mounted infantry. The depiction of the Battle of Hastings on the Bayeux Tapestry (fig. 13) shows that by the late 11th century it was usual for knights to have lance and sword, footmen to have spear or bow. The horses of the knightly class, ridden with stirrups and saddle, made possible a charge with couched lances, though it was still more usual to throw or thrust overarm. Axes, clubs, and spears were the chief weapons of the English, who fought on foot; over the years they gave way in the main to Norman weapons. The sword came to be distinctively knightly, the weapon of the final close combat and the instrument of knighting.

Evidence from art and architecture suggests that the heyday of the couched lance was between 1100 and 1300. Examples are the carved stone warriors in St. Mary's, Barfreston, an illumination in a mid-12th-century *Life of St. Edmund*, and some tiles at Little Kimble and at Chertsey Abbey (fig. 140: see TILES). In the 13th century its use is illustrated in the *La Estoire de Seint*

Aedward le Rei and recounted in tales of Edward I's battles in Scotland. Thereafter it belonged to tournament, not the battlefield. The very term "lance" came to mean the unit of two men-at-arms and a servant, rather than the weapon. At the same time a less significant weapon, the dagger, was added to many knights' equipment.

The sword is even more emphatically a knightly weapon than the lance, involving the noble quality of the personal encounter. The Bayeux Tapestry shows it wielded by both cavalry and foot. Its users may well have fought with lance or spear before turning to hand-to-hand fighting. Attached to the belt, it left the hands free for other weapons until it was drawn. The ritual of knightng expressed the sword's special status, and in effigies and brasses it figures large, the hand of the knight resting on the pommel. It is also prominent in battle scenes. The shield changed, too. From being kite-shaped or round it became triangular by 1200. Thereafter, with the advent of plate armor, it became redundant in warfare but survived in its heraldic role.

The archers, already essential at Hastings, became highly skilled and mounted longbowmen, respected partners of the men-at-arms. The Welsh, so vividly described by Gerald of Wales in the 12th century, had very likely made a major contribution to this development. The longbow was about 5 feet 8 inches in length and usually of yew wood, the arrows about 3 feet. Simple to make, it required strength and skill to operate; in the 14th century kings legislated in favor of regular training.

Siege weapons developed in response to castle development. As the stone towers of the Normans evolved into the elaborate concentric fortifications of the later 13th century, engines were invented that used balances to throw bigger stones farther and harder. These were not entirely superseded by cannon, using gunpowder and iron balls, at the end of the Middle Ages. At the same time that alchemists (notably Oxford's Roger Bacon) were absorbing and developing Sino-Arabic knowledge of gunpowder, practical men invented arrow-throwing guns. It was not until the siege of Calais in 1346 that there was an extensive use of cannon firing iron balls, and the art remained too primitive to supersede balance-operated artillery for another century.

For about 250 years the "lorica" of chain mail (interlocked rings of iron) was the chief body armor. The Bayeux Tapestry shows both sides wearing it. The main distinction between the Normans and the Saxons was that the former's leg mail was full, the latter's but knee-length. This was a distinction between mounted and foot and recurs at intervals thereafter, as depicted in the Peterborough Psalter (1222). The main changes before the advent of plate armor were the addition of new pieces: for the neck ("aventail"), hands, and feet. The aventail, just possibly indicated by the "bibs" of Normans in the Tapestry, is not clearly depicted until a mid-13th-century effigy, possibly of

William Marshal the Younger. Sometimes a “balaclava” of chain, often under a helmet, met this need. Around the year 1200 gloves and shoes of mail appear in statues at Hereford and wall paintings at Claverly. From then on such additions are the norm.

The biggest change in medieval armor was from chain to plate, made feasible by the development of lighter steels around 1200. The poet of the Battle of Bouvines (1214) celebrated the power of armor. But it could go too far. The chronicler of Bannockburn (1314) bemoaned the death of England’s hero, the earl of Gloucester, the weight of whose armor kept him helpless after he was thrown from his horse. The rise of plate can be traced in effigies and brasses. From around 1250 they show the addition of breast plate and in rough sequence, knee, elbow, finger, shoulder, arm, and leg pieces. A high point in cover and protection is exemplified by the armor of the Black Prince (d. 1376), depicted in his effigy at Canterbury. By then the separation of effective battle armor from the monstrosities donned for ceremony and tourney had already begun.

Fig. 14. Memorial brass of Sir Hugh Hastings (d. 1347), Elsing, Norfolk. After A.L. Poole (1958). Reprinted by permission of Oxford University Press.

The helmet went through a parallel evolution. Initially a conical hat, usually with a nasal piece, it was replaced or at least supplemented by a variety of

forms. A favorite in the 12th century was flat-topped and barrel-shaped, with full face covering, frequently of mail. Later versions had movable visors. In any case these helms, crowned with symbols of heraldry and plumes or crowns, were better suited to ceremonial use. A reversion to a simpler conical helm with some kind of face piece was much better for war.

These developments can be seen in the Bayeux Tapestry (the conical version with and without nasal), the Hereford statues (the primitive flat top with chain headware beneath), the brass of Sir Hugh Hastings at Elsing (a mid-14th-century conical helmet with hinged and pointed face piece; [fig. 14](#)), and, to take two late examples of war and tournament types, the effigy of Sir Oliver Ingham, also mid-14th-century, and the drawing of a judicial combat by John Rouse in the late 15th century. The barrel-shaped flat top survived to, or reappeared at, the end of the Middle Ages.

Footmen's armor was simpler and, where equivalent, later than that of knights. Mostly made of hard leather, there was often some minimal mail composition. The armor was capped with a plain helmet, round or conical in shape (basinet) or sallet (a metal cap). Though less protected, foot soldiers retained a flexibility of action that many knights must have envied.

Ars moriendi (The Art of Dying)

A genre of religious instruction focusing on preparation for death. Religious treatises or parts of treatises on the "art" of dying well occur with some

frequency in 14th- and 15th-century ME literature and are drawn from several distinct Latin and French sources. The earliest ME examples of the tradition occur as parts of the English translations of the *Somme le roi*, which includes a section on dying well (e.g., *The Ayenbite of Inwit*, *The Book of Vices and Virtues*, and Caxton's *Royal Book*). Parts of the *Horologium sapientiae* by Heinrich Suso (ca. 1296–1366) provided material for the late-14th-century *Scire mori* (*To Know How to Die*) and Thomas Hoccleve's rime royal *Ars sciendi mori* (ca. 1421–22).

Several early-15th-century ME works draw in whole or in part on Anselm of Canterbury's *Admonitio morienti* (*Advice to the Dying*), including the prose *De visitacione infirmorum* (*On the Visitation of the Sick*), a poem of the same title by John Audelay (d. ca. 1426), and part of the anonymous *Craft of Dying*. The primary source for the *Craft of Dying*, however, is the *Tractatus* (or *Speculum*) *artis bene moriendi*, one of the major Latin works in the genre, based on Part 3 of Jean Gerson's *Opusculum tripartitum* (written in French and translated into Latin ca. 1400–10). Other ME works in the tradition include the early-15th-century *Disce mori*, in which an *ars moriendi* introduces a lengthy encyclopedia of general religious doctrine; a miscellany published by Caxton called *Ars moriendi* (1489–91); and *The Art and Craft to Know Well to Die*, Caxton's translation of a French *ars moriendi* based on the Latin *Tractatus* (1490).

The genre continued to flourish among humanist, Reformation, and Counter-Reformation writers, from Thomas Lupset (*The Way of Dying Well*, 1534) and Thomas More (*A Dialogue of Comfort*, 1534) to Jeremy Taylor (*The Rule and Exercises of Holy Dying*, 1651).

Art, Anglo-Saxon

Early Anglo-Saxon Art

The term “early Anglo-Saxon” describes the period ca. 600–793, roughly covering the years from the conversion to Christianity to the coming of the Vikings. This is the period that sees both the birth of English art and the birth of the English nation, although early Anglo-Saxon art is not characterized by a distinct, homogeneous style but is rather a blanket term covering a variety of changing styles and artistic and cultural influences. It has often been said that early Anglo-Saxon art is a visual expression of power and status for both institutions (the church) and individuals (nobility), but in this it is no different from art elsewhere in early-medieval Europe. If anything can be said to characterize art for the entire 200-year span, it is its surface orientation and its multivalence.

The Anglo-Saxons loved glittering, colorful, highly decorated surfaces in all media. Manuscripts, metalwork, and sculpture all display *horror vacui* (literally, a fear of empty space). The Sutton Hoo jewelry, the Lindisfarne Gospels (figs. 84–85: see LINDISFARNE GOSPELS), the Franks Casket (fig. 63: see FRANKS CASKET), and the Bewcastle Cross (fig. 74: see HIGH CROSSES) are all examples of objects on or in which a rich complexity of interlace, animal ornament, and abstract or foliate patterns cover as much of the surface as possible. Manuscripts and metalwork in particular display a love of rich and shimmering colors, the polychromy that is such a prominent part of the 8th-century “Tara-Lindisfarne” style. Metalwork also exhibits an awareness of the effects of light. The stamped gold foils embedded beneath the surfaces of the garnets on so much of the jewelry from the early period serve to reflect and refract light, to add brightness to the stones, and to break up the surface of the object. The love of surface ornament continues in English art well into the modern era.

The complexity of surface design that characterizes Anglo-Saxon art is paralleled by the complexity of its symbolism. Powerful images are layered one upon the other to produce, in effect, super symbols on both pagan and Christian objects. On the Sutton Hoo gold buckle (fig. 137: see SUTTON HOO), for example, images of aggressive creatures—serpents, birds of prey—cover the entire top surface. The buckle becomes both a symbol of warrior power and an apotropaic object designed to ward off evil and protect its wearer. The fact that the buckle may also have served as a reliquary (almost certainly pagan) would only have added to its power.

This same layering of symbolism appears in a Christian context on the cross carpet pages of such manuscripts as the Lindisfarne Gospels (BL Cotton Nero D.iv), dated ca. 698, and in the sculptural program of the 8th-century Ruthwell Cross (figs. 111–14; see RUTHWELL CROSS). In the Lindisfarne Gospels animal ornament and crosses combine with, or are embedded in, other crosses to form complex and powerful symbols that enshrine and protect the written word. On the primary faces of the Ruthwell Cross scenes of Christian doctrine are embedded within the monumental stone cross and then glossed with Latin inscriptions—adding a further level of significance to their meaning. The narrow sides of the cross are carved with Mediterranean-derived inhabited vinescroll ornament, turning the whole into a monumental tree-of-life whose meaning is further elucidated by the runic poem inscribed around these panels.

There are many different artistic and cultural influences at work in the early period, including native British art, Celtic and Irish art, and the art of Scandinavia, the Mediterranean, Byzantium, and the European continent. There is also no single center of Anglo-Saxon art but rather a variety of regions producing works in a variety of styles. In the early 7th century the south of England, particularly the kingdom of Kent, was home to an especially fine school of metalworking. Kentish metalwork includes some of the most famous pieces of Anglo-Saxon jewelry, such as the Sarre and Kingston Down brooches. The Sarre Brooch is gilt-bronze inlaid with white shell, garnets, and panels of gold filigree. The Kingston Down Brooch is gold inlaid with blue glass, white shell, garnets, and panels of zoomorphic filigree. These grand brooches, worn singly, reflect both Frankish fashion and the polychrome style of Frankish jewelry, although the Anglo-Saxon color range is more limited, characterized particularly by a love of the red and gold color combination. Kent's dominant role in trade between England and Frankish Gaul is no doubt largely responsible for the profound Frankish influence on the art of the region. Both the Sarre and Kingston Down brooches are decorated with a complex design of multiple crosses, though it is unclear whether this was meant to have any Christian significance or was simply meant as a fine ornamental design. Perhaps it was both.

Looking at manuscripts, Christian content is unequivocal. With Christianity came literacy, the written word, the book, and the need for instruction—much of it visual. One of the two great early centers of Anglo-Saxon manuscript production was the monastic complex at Canterbury in Kent. Christianity in the south of England was a Mediterranean import, and Canterbury manuscripts do show a marked Mediterranean influence, probably via such manuscripts as the 6th-century St. Augustine's Gospels (Cambridge, Corpus Christi College 286). In 8th-century Canterbury manuscripts like the Vespasian Psalter and the Stockholm Codex Aureus (BL Cotton Vespasian A.i and

Stockholm, Royal Library A. 135; [figs. 141](#) and [133](#): see VESPASIAN PSALTER and STOCKHOLM GOSPELS), the relative three-dimensionality of the figures and the spaces they inhabit as well as the modeling of faces and forms are clearly derived from Mediterranean prototypes, though the forms themselves have become flattened and patterned, a feature particularly noticeable in the drapery. The influence of Hiberno-Saxon art is also evident in the trumpet spirals and peltae (shield-shapes) that decorate the arches around the figures, as well as in the elaborate treatment of the text. The Vespasian Psalter contains one of the earliest historiated initials (fol. 53), an insular, if not Anglo-Saxon, invention.

Both the text and miniatures of the Codex Aureus show the increasing influence of Hiberno-Saxon art, probably via Northumbrian centers, such as Lindisfarne. As in Hiberno-Saxon manuscripts the Incarnation page of the Codex Aureus has been picked out for special attention, and the text is embedded in flat panels of gold or pigment, as if it were metalwork. The book becomes, in effect, a precious relic.

A number of pages (e.g., fols. 16 and 131) display crosses surrounding discrete areas of text, the two worked in combinations of gold, silver, and colored inks, set off against a purple-stained background. Ultimately these patterns derive from the *carmina figurata* of Constantine's court poet Porphyrius, but the scribe-artist has given them a distinctly Anglo-Saxon twist. The gold and red (or purple) color combination is familiar from Kentish metalwork, but here it takes on a new meaning. The gold cross stained with purple is encountered again in both the Ruthwell poem and in the later *Dream of the Rood*, as well as on the 11th-century Brussels reliquary cross. It seems to have been a particularly powerful and long-lasting image for the Anglo-Saxons, calling up images of death and life, triumph and tragedy, and making the cross, once again, a multivalent tree-of-life. It is also interesting that while the color purple in Anglo-Saxon art certainly indicates a prestige object—as it did throughout the Middle Ages—it also seems to have had more of a sacramental symbolism than a royal one. This will change in the later period.

The lavish use of gold in southern manuscripts distinguishes them from manuscripts of the second great locus of book production, Northumbria. Today we associate these impressive works with the monasteries of Lindisfarne and Wearmouth-Jarrow, though Hartlepool, Whitby, and many of the lesser houses no doubt also produced impressive work. The northern houses were every bit as cosmopolitan as Canterbury. Their abbots and abbesses are recorded as traveling frequently to visit Rome and continental foundations. Hild planned to visit Chelles, while Benedict Biscop brought panels painted with biblical figures back to Wearmouth from Rome. Stained glass, surely an imported craft, has come from Jarrow, and the 9th-century poem *De abbatibus* records the

importation of an altar from Ireland to an anonymous cell of Lindisfarne.

Lindisfarne itself was a crossroads for influences from both the Columban west and Rome. A Columban (i.e., Irish) foundation, it eventually went over to Roman practice at the Synod of Whitby (664). It seems to have been the center of production for objects in a variety of media. The complexity of the carpet pages of the Lindisfarne Gospels has already been discussed. The evangelist portraits are equally interesting, both for their combination of the native taste for patterns of line and color with ultimately Mediterranean figural models and also for their combination of Greek and Latin language. The name of each evangelist is written in Greek, while each symbol is named in Latin (e.g., *Hagios mattheus, imago hominis*).

This interesting combination of languages may be characteristic of the objects and monuments associated with Lindisfarne. It appears again on a series of commemorative “name stones” from the monastic cemetery. The name stones all display central crosses of varying design, while names are carved in the four quadrants. On at least five of the stones one name is carved in runes, the other in roman letters. In at least two cases the same name is repeated. The reasons for the practice are unclear, but it is certainly indicative of the multilingual nature of the monastery. The Ruthwell Cross has also been associated with Lindisfarne, and its combination of Anglo-Saxon runic and Roman inscriptions has already been noted.

All of these monasteries, Canterbury, Lindisfarne, and Wearmouth-Jarrow, would have been elaborately decorated with architectural sculpture and painted plaster, only traces of which now survive. Churches would also have housed precious liturgical vessels, altar cloths, and other furnishings.

Two great schools of sculpture emerged in Mercia in the 8th century, one in eastern, the other in southwestern Mercia. In the east sculpture was primarily architectural. The 8th-century architectural sculpture at Breedon-on-the-Hill in Leicestershire (figs. 134–36: see *STONEWORK AS ECCLESIASTICAL ORNAMENT*) is an early and prime example of the work of this school. The Breedon sculpture includes friezes of plant scroll, some densely inhabited by a throng of battling men and monstrous beasts, many of which look forward to the grotesque creatures of the later medieval period. (The same is true of such 8th-century manuscripts as the Barberini Gospels [Vatican, Biblioteca Apostolica Barberini lat. 570], itself possibly produced in Mercia.) Compared with the monumental, iconic figures of the Ruthwell or Bewcastle crosses, these Mercian creatures exhibit an agility and expression new to Anglo-Saxon sculpture. The Breedon sculptures, as much of Anglo-Saxon sculpture, were probably originally painted, and the bright colors would certainly have added to the sprightly action of the scenes. The arrangements of single and paired animals included in these scenes are also characteristic of Mercian manuscripts, such as the

Barberini Gospels or the Book of Cerne (CUL LI.I.10), as well as of metalwork. There are also examples of figural sculpture at Breedon, which, though they may be of lesser quality, display the same lively expression seen in the friezes.

In southwestern Mercia high crosses tend to take precedence over architectural sculpture. Here, too, single and paired beasts, especially beasts caught up in plant-scroll ornament, are particularly popular. In both Mercian schools this abundance of creatures may be meant to represent the fertility of life in the Christian world.

In metalwork silver begins to take precedence over gold in the Mercian period, and an interest in dark-light effects—chipcarving, niello against silver, openwork decoration—replaces the polychromy of earlier metalwork. Animal ornament remains popular, but the elaborately interlaced animals of the 7th century give way to heraldic creatures often displayed against a background of fine interlace. The late-8th-century linked pins from the River Witham (Lincolnshire) or the early-9th-century brooches from the Pentney hoard (Norfolk) are fine examples of this style.

Whether we are dealing with brooches or architectural sculpture, the art of the early Anglo-Saxon period is aristocratic, designed to enhance the power of church and state, the two more often than not working hand-in-glove. We know that women, such as Hild at Whitby or, at a later period, Æthelflæd in Mercia, had a powerful role in shaping the emerging church and nation; yet they are all but invisible in the material record. There are few references to women artists in any media, and, while we know that the Anglo-Saxons were renowned for their textiles and needlework—produced primarily by women—few examples survive. This invisibility is undoubtedly due in large part to the Christianity that ironically gave women like Hild a power base. It may also be due to the biases of chroniclers, kings, and scholars throughout the centuries.

Later Anglo-Saxon Art

The later Anglo-Saxon period covers roughly the 10th and 11th centuries. The art of this period displays a more homogeneous style than that of the early Anglo-Saxon or Viking Age periods. The influence of Scandinavia and Carolingian France is still strong but is now joined by the influence of Ottonian Germany. A significant number of elements of earlier Anglo-Saxon style do also continue and in some cases are fully developed in this later period—chief among them being the use of rich patterns of line and color, the emphasis on surface effects, and an interest in grotesque, comic, and marginal imagery. These native features are combined with foreign influences to

produce an art so rich and original that the period has come to be known as the “golden age” of Anglo-Saxon art.

The 10th century ushers in a renaissance in most aspects of Anglo-Saxon life, including art. Alfred’s successors gradually conquered the areas previously held by the Scandinavians, a flourishing court life appeared, and the church gained new vigor under the Benedictine Reform. The sudden burst in the amount of and variety of subjects depicted in architectural sculpture is generally linked to the decoration (or redecoration) of reformed churches. Most significant is an increased interest in the depiction of figural subjects, as evidenced by the Romsey Crucifixion scenes (fig. 110: see ROMSEY ROODS) or the Bristol Harrowing of Hell; in style and subject both have analogues in contemporary manuscripts. The patterned folds and lively poses of the figures in the Bristol relief are close to those of the figures in the Tiberius Psalter Harrowing of Hell (BL Cotton Tiberius C.vii, fol. 14) or the ivory baptism of Christ in the British Museum (MLA 1870, 8–11, 1). While the Bristol figures do not display quite the expression or energetic lines of these latter works, they do display a new sense of classicism ultimately due to continental influence.

The late Anglo-Saxon “renaissance” is most profoundly noticeable on portable objects, such as manuscripts, metalwork, and ivory carving. Some of the earliest pieces to display the new style appear in the late 9th century, the Alfred Jewel (fig. 1: see ALFRED AND MINSTER LOVELL JEWELS) and Fuller Brooch (fig. 65: see FULLER BROOCH) being prominent examples. Both objects display evidence of interest in a new, more intellectually oriented type of symbolism. To the old repertoire of apotropaic animal ornament and abstract religious symbols (cross, fish, etc.) later Anglo-Saxon artists add personification. The Fuller Brooch is decorated with personifications of the five senses surrounded by a border containing symbols of the human, animal, avian, and vegetable kingdoms. The central figure on the Fuller Brooch is a personification of Sight. The enamel figure decorating the main face of the Alfred Jewel may also represent Sight; alternatively it may represent Christ, or even Alfred. Other new iconographic types include the Beast-Mouth of Hell, the disappearing Christ, and the rough-hewn cross, all Anglo-Saxon innovations.

The new interest in the human figure is significant and undoubtedly due to continental influences brought in with the Reform, combined perhaps with a growing concern for the contemporary world of men and women. This is also the period that sees the growth of narrative (an interest in visual storytelling), “scientific” books, the beginnings of portraiture (of a very general kind), and the development of a new artistic interest in the royal court, if not a court school of art.

The two great schools of late Anglo-Saxon manuscript illumination are located at Winchester and Canterbury (although the attribution of so many

manuscripts to these two centers alone has been called into question). While neither style is confined to the city for which it is named, both cities are major centers of artistic production.

The Winchester style is strongly connected to the royal court. King Edgar appears in one of the earliest Winchester manuscripts, the New Minster Charter (BL Cotton Vespasian A.viii) of ca. 966 (fig. 101: see NEW MINSTER CHARTER), while portraits of Cnut and Emma grace the New Minster Liber Vitae (BL Stowe 944) from the 1020s. The most famous manuscript of the late 10th century, the Benedictional of Æthelwold (BL Add. 49598; fig. 26: see BENEDICTIONAL OF ÆTHELWOLD) has also been shown to contain significant royal imagery. The Winchester style is characterized by lively, expressive figures, rich pigments, color washes and color outline drawings, a profuse use of gold, and above all by its fleshy acanthus ornament, derived ultimately from Carolingian art. The style is not limited to manuscripts and can also be seen in the rich textiles commissioned for St. Cuthberts shrine, as well as in ivory sculpture, such as the Liverpool Nativity panel (Liverpool, Merseyside County Museum Mayer Collection M 8060) or the Nativity panel in the British Museum (MLA 1974, 10–2, 1), both from the second half of the 10th century.

Movement, color, and pattern continue to develop in late Winchester-style manuscripts, such as the early-11th-century “Missal” of Robert of Jumièges (Rouen, Bibliothèque Municipale Y.6). Here lively figures are set against a background of billows and streams of color, built up from layers of multicolored lines and washes. The figures themselves are fine examples of late Anglo-Saxon draughtsmanship. Acanthus flies out from the gold trellis borders, giving the impression of a divine wind blowing across the page.

Canterbury manuscripts also have royal associations. King Edgar appears again on fol. 2v of the *Regularis concordia* (BL Cotton Tiberius A.iii) produced at Christ Church, Canterbury, in the second half of the 11th century. Indeed the role of the court in the monastic reform, as well as in the patronage and development of Anglo-Saxon art, should be borne in mind. Canterbury School manuscripts are characterized by dynamic outline drawings, some in color, some in simple black ink. Carolingian influence is clearly evident in such works as the Harley Psalter (fig. 71: see HARLEY PSALTER), a copy of the Carolingian Utrecht Psalter; however, the artists of the Harley Psalter transform the monochrome drawings of their model into brilliant color (as well as adapting many of the scenes to conform to contemporary tastes and circumstances).

Canterbury itself exhibits a profound interest in usable, instructional books, evidenced by such works as the late-10th-century copy of Aldhelms *De virginitate* (London, Lambeth Palace Library 200); St. Dunstan’s *Classbook* (Bodl. Auct. fol. 4. 32, a composite volume of 9th- through 11th-century date);

or the *Psychomachia* of Prudentius (BL Cotton Cleopatra C.viii), a composite 10th- to 12th-century manuscript. Also attributed to Canterbury are the two great examples of late Anglo-Saxon vernacular manuscripts, the “Cædmon” Genesis (Bodl. Junius 11), illuminated ca. 1000, and the illustrated Hexateuch (BL Cotton Claudius B.iv), from the second quarter of the 11th century. The expanded visual narratives of these manuscripts are particularly interesting because they are not always in accord with what we read in the text. In the *Psychomachia*, for example, the text tells us that the combatants are monsters and armored warriors, but by and large we are shown images of warring women dressed in Anglo-Saxon fashion.

The verbal and visual dialogue created in these manuscripts is also found in metalwork, most notably on the Brussels Reliquary Cross (Brussels, Cathedral of St. Michael), produced in the early 11th century. The primary face of the cross has been lost, but the back is decorated with the Agnus Dei and symbols of the evangelists. A central inscription reads *Drahmal me worhte* (Drahmal made me), while a second inscription around the edges of the cross reads *Rod is min nama geo ic ricne cyning bær byfigynde blode bestemed* (Cross is my name; once, trembling and drenched with blood, I bore the mighty King). It goes on to state that Æthelmær and Æthelwold had the cross made for Christ and their brother Ælfric. The inscribed words uttered by the cross almost certainly connected the apocalyptic imagery of the rear panel with a Crucifixion on the missing front. The presence of a similar inscription on the 8th-century Ruthwell Cross indicates that the dynamic relationship between image and object (and viewer) does have precedents.

The new interest in science can be seen in such manuscripts as the *Herbal* produced at Winchester and now part of a composite 11th- to 13th-century manuscript (BL Cotton Vitellius C.iii), or the copy of *The Marvels of the East* illuminated at Canterbury in the second quarter of the 11th century and part of a collection of mainly secular scientific texts (BL Cotton Tiberius B.v). While not scientific texts in the modern sense, such works do combine genuine classical scientific studies with early-medieval stories and legends to produce a semifactual pseudo-science. The illustrations, possibly intended to lend a note of authority by making specific plants, animals, or monsters easier to recognize, are also highly entertaining, particularly in *The Marvels of the East*. The latter manuscript can, however, also be highly disturbing. Both text and illustrations tell the story of the barbarous peoples and monsters that inhabit the East, the area outside the borders of the western European civilized world. In many of the illustrations the bodies of the creatures overlap the frame of the miniature (fols. 82v, 85v, 86). Indeed the justly famous *Blemmyae* on fol. 82 stands on the lower register of the frame and grips the sides with its hands as if trapped but trying to escape. The dynamic tension this creates has been

noted by many authors, but it is also threatening. These creatures cross boundaries and stand between our world and the world of the book, defying the neat ordering of the world expressed in such poems as *Maxims I*, *Maxims II*, and *The Order of the World*, or in the domesticated agricultural scenes of the calendar in the same manuscript.

Late Anglo-Saxon monsters and marginal images can, however, also be delightfully whimsical in both religious and secular contexts. The dynamic figures inhabiting the borders of the early-11th-century Bury Psalter (Vatican, Biblioteca Apostolica Reg. lat. 12) or the creatures that crawl their way across the surface of the mid-11th-century ivory pen case in the British Museum (MLA 1870, 8–11) are fine examples of both the Anglo-Saxon taste for grotesque monsters and the increasing interest in marginal space. Ultimately both have their roots in earlier Anglo-Saxon works, such as the 8th-century Barberini Gospels (Vatican, Biblioteca Apostolica Barberini lat. 570) or the carved stone friezes from Breedon-on-the-Hill, Leicestershire; however, the new energy of both creatures and compositions looks forward to the fabulous monsters of Romanesque works like the Lincoln frieze (fig. 11: see ARCHITECTURE AND ARCHITECTURAL SCULPTURE, ROMANESQUE) or the Kilpeck doorway (fig. 76: see KILPECK).

Art, Anglo-Saxon: Celtic Influences

The confluence of Anglo-Saxon and Celtic artistic traditions in 7th- and 8th-century England is one of the major sub themes in the study of insular art. The recent reassessment, based on archaeological research, of the nature of the arrival of the Anglo-Saxons in England, from armed invasion to gradual settlement, has necessitated a reevaluation of the relationship between the Anglo-Saxons and their British Celtic neighbors and subjects. Further, the role of the Irish church in the conversion of the Anglo-Saxons to Christianity provided a conduit for the influence of Ireland on the developing art of early-medieval England, especially north of the Humber.

Much of the early influence from the various insular Celtic cultures on pre-Christian Anglo-Saxon art is observed in metalwork discovered as high-status Anglo-Saxon grave goods, the evidence of production for which, however, is found primarily at Celtic sites in western and northern Britain and in Ireland. David Longley’s study of the distribution of type H penannular brooches and group 1 openwork escutcheons indicates a relatively long-term trade from Celtic and Pictish Scotland into eastern England. Michael Ryan has suggested that the enameled escutcheons of the largest hanging bowl found in Mound 1 at Sutton Hoo were probably made in the Irish Midlands. They could have arrived via trade, but they may also have arrived as diplomatic gifts. The

influence of such objects is seen in the formation of local taste for particular ornamental techniques: *millefiori*, a popular technique in Irish Midlands enamelwork but not common in Anglian metalwork, was used in the local Sutton Hoo workshop, probably under the influence of imports like the hanging bowl, although the technique itself was most probably learned from a craftsman trained in a Celtic milieu.

Although the British Celtic and Anglo-Saxon cultures were in contact during Anglo-Saxon settlement and hegemony in England, demonstrable points of continuity in the secular realm are rare. The hanging bowls, for example, traveled from Celtic to Anglo-Saxon milieux by trade or gift, but their functions may well not have been continuous between the two cultures. In the British Celtic context they may have served as Christian liturgical vessels and/or as washbasins, as part of the civilities of secular hospitality; in pagan Anglo-Saxon graves they may have been construed as part of a banqueting assemblage for the deceased or, alternatively, used to hold cremation burials or food offerings to the dead, such as the onions and crabapples at Forddown. However, there does seem to have been some continuity in the selection of ceremonial and political centers; the Anglo-Saxon royal residence at Yeavinger occupies the site of an earlier British complex.

Irish influence is clearly evident in the development of Anglo-Saxon manuscript illumination, especially in centers under the strong influence of Iona, established in 565 as a center of Irish missionary activity in Scotland and later active in the conversion of the northern Anglian kingdom of Northumbria through the establishment of Lindisfarne. The use of enlarged initials, often followed by a series of letters gradually diminishing in scale (insular diminution), is found in early manuscripts from Ireland and Irish missions on the Continent, such as Bobbio (Milan, Ambrosiana S.45.sup., Jerome, *Commentary on Isaiah*, p. 2; probably also from Bobbio, Ambrosiana D.23.sup., Orosius, *Chronicon*, fol. 2). This convention later emerges as a standard decorative technique in the products of northern English scriptoria, as in the Lindisfarne Gospels (figs. 84–85: see LINDISFARNE GOSPELS). Paleography and text recensions also demonstrate connections across the Irish sea. The documentary record indicates a considerable traffic of scholars traveling to Ireland in pursuit of higher education, with a strong emphasis on the classical tradition; Bishop Aldhelm of Sherborne's correspondent Ehwald spent six years there, and King Aldfrith of Northumbria was also a scholar in Ireland during his predecessor Ecgfrith's reign. Despite the hostility generated by the decision of the Synod of Whitby in 664 in favor of the Roman church's calculation of the date of Easter and preferred shape of the clerical tonsure over the conflicting Irish traditions, these links continued into the 8th century. Given the mobility of manuscripts and the documented movement of clergy in

both directions across the Irish Sea, there remains considerable controversy over the origin of particular manuscripts, as, for example, the Echternach Gospels, in Irish or Anglo-Saxon centers or in their continental missionary offshoots. The generic term “insular” is often used to refer to the art of England and Ireland in the late 7th and 8th centuries so as to indicate the extent of contacts and affinities of style across the Irish Sea.

Art, Anglo-Saxon: Classical Influences

The classical influence on Anglo-Saxon art involves the Christian inheritance of Greco-Roman concepts reflected in the art of the late-antique world of Rome and Constantinople, which was introduced into England with the arrival of the Christian missions from Rome in the late 6th century. The subsequent conversion of the Anglo-Saxons resulted in a constant importation, primarily from Italy and Gaul, of classical art in the form of a variety of portable items, such as paintings, illuminated manuscripts, figured textiles, decorated glass,

carved ivory and metalwork bookcovers and reliquaries, and even late-imperial coinage. These artifacts were often the genuine products of late antiquity; alternatively they could be artifacts inspired by subsequent conscious revivals of a classical inheritance, such as that which motivated Charlemagne in Carolingian France.

There is the further possibility that standing Roman structures surviving in mainland Britain also had a classicizing influence on Anglo-Saxon art. There is evidence—for example, in Bede's writings—that this material was understood by the Anglo-Saxons to be the product of the imperial world, and that it was reused by them in some of the earliest ecclesiastical contexts, as at Hexham, Northumberland. What is clear is that the classical influence, whether direct or indirect, on Anglo-Saxon art lay in both the introduction of new monument forms and in the motifs used to decorate them.

Anglo-Saxon stone sarcophagi are clear examples of a classical funerary art influencing the production of a monument form new to the Anglo-Saxons. A number of these monuments survive from the late 8th or early 9th century onward at ecclesiastical centers in Mercia (at St. Alkmund's Derby, Bakewell, and Wirksworth, in Derbyshire), and Northumbria (at Durham).

Another Anglo-Saxon monument type inspired by late antiquity is the round stone column (probably surmounted with a cross) that was produced in apparent imitation of the triumphal columns of imperial Rome. The remains of one such monument of 9th-century date survive from Reculver, Kent, and others are found at Dewsbury and Masham (Yorkshire); from a later date the 10th-century columnar shaft at Wolverhampton still stands *in situ*.

On a smaller scale classical influences also lie behind the construction of carved ivory reliquary boxes, such as the possibly late-7th-century Franks Casket (fig. 63: see FRANKS CAS ket) from Northumbria, and the 8th-century Gandersheim Casket from southern England. These represent imitations of late-imperial reliquaries, such as the 4th-century Brescia Casket, whose form, in turn, was based on the large-scale sarcophagi.

It is the decoration of these and other artifacts, such as the manuscripts, that shows how widespread the influence of late-antique art was in Anglo-Saxon England. The double registers of closely packed figures on the Wirksworth sarcophagus cover, for instance, closely resemble the decoration of the early Christian Italo-Gallic sarcophagi, while the layout of the carving in registers encircling the Masham and Wolverhampton columns is reminiscent of classical triumphal columns.

The strong influence of classical art is also clear in the figural decoration of Anglo-Saxon stonework. Many of the Northumbrian crosses, such as those from Rothbury (fig. 15), Bewcastle (fig. 74: see High Crosses), and Ruthwell (figs. 111–14: see Ruthwell Cross), or Easby, Otley, and Collingham (in

Yorkshire), are filled with clean-shaven, short-haired figures with well-modeled faces, often presented in semiprofile, wearing the classical toga and pallium. It is a figural style closely based on that which flourished in Italian art of the 5th and early 6th centuries.

This art also influenced the iconography of Anglo-Saxon carving, although overtly “classical” scenes, such as the Sack of Jerusalem and Romulus and Remus featured on the Franks Casket (and the 8th-century Larling plaque from Norfolk), are rare. More common is the influence of early Christian iconography seen in the fragmentary Ascension scene on the Reculver column, where Christ is depicted walking in profile and reaching toward heaven. This iconographic type was current in Italian art during the 4th and 5th centuries.

Such early Christian art has long been argued as having inspired the iconography of the Ruthwell and Bewcastle crosses, and its influence can also be seen on the remains of the late-8th- or early-9th-century Northumbrian cross from Rothbury. Here figures in the cross-head present attributes to Christ that were directly inspired by the symbols of power depicted on late-consular diptychs, while at the top of the cross-shaft was a scene of the Raising of Lazarus showing Martha in an exaggeratedly crouched position and Lazarus with his eyes closed; it is a scene inspired by a late-4th- or early-5th-century iconographic type from Italy. In 9th-century Mercian sculpture the same classical influences were available. On a cross-shaft at Sandbach (Cheshire) a depiction of the Nativity showing only the ox, ass, and angel adoring the Christ Child set in an ornate crib is clearly linked to an iconographic type found on 4th-century sarcophagi in Rome.

Fig. 15. Christ in Majesty, Rothbury cross shaft. Currently in the Museum of Antiquities, University of Newcastle-upon-Tyne. Courtesy of the Museum of Antiquities, University of Newcastle and the Society of Antiquaries of Newcastle upon Tyne.

The direct influence of classical art is seen clearly in the decoration of Anglo-Saxon manuscripts, such as the late-7th-century Codex Amiatinus (Florence, Biblioteca Medicea-Laurenziana Amiatinus I; [fig. 143](#): see Wearmouth-Jarrow and the Codex Amiatinus) and the ca. 700 prototype of the 9th-century Antwerp Sedulius (Antwerp, Museum Plantin-Moretus M.17.4), both apparently inspired by 6th-century Italian works. The figures illustrated in these manuscripts are attired in classical garb and described in a naturalistic manner, often highlighted and treated with a sense of perspective. The classical nature of this figural style is clear when compared with that found, for instance, in the Lindisfarne Gospels (BL Cotton Nero D.iv) or the Durham Cassiodorus (Durham, Cathedral Library B. 11.30), where the figural style is characterized by linear patterning with flat areas of color, and little attempt at

naturalism and perspective. However, even these “insular” figures reveal the influence of late-antique art in their facial features and classical garments.

Yet it is not simply the figural style adopted in these manuscripts that reveals the influence of classical art. Much of their iconography was also inspired by late-antique types. The illustration of David the Psalmist in the mid-8th-century Vespasian Psalter (BL Cotton Vespasian A.i, fol. 30v; [fig. 141](#): see Vespasian Psalter) for instance, has its ultimate source in imperial courtly art of the late-antique world, in representations of the emperor surrounded by his courtiers. Such imperial art (probably through intermediary Carolingian imitations) also inspired the pages of gold-and-silver-inscribed purple-dyed vellum found in many of the more deluxe Anglo-Saxon manuscripts (e.g., BL Royal I.E.vi); it was also ultimately responsible for the stately portrayals of the evangelists in such manuscripts as the Stockholm Codex Aureus (Stockholm, Royal Library A. 135).

Thus, while much of the earlier Christian art of Anglo-Saxon England was directly influenced by the form and decoration of late-antique artifacts imported from the Mediterranean world, some was also influenced by artifacts that were themselves the products of conscious classical revivals. The influence of such imitations on Anglo-Saxon art became more pronounced during the late 9th to 11th centuries, when much of the art, particularly that produced outside the area of the Danelaw, was inspired by the classicism of continental (Carolingian and Ottonian) intermediaries; it was these influences that gave rise to the distinctive styles of the so-called Winchester and Canterbury “schools” of the late 10th and 11th centuries.

Art, Gothic

English Gothic art is often assumed to commence suddenly in 1175, when William of Sens arrived in England to begin reconstruction of the Canterbury Cathedral choir. The change from Romanesque to Gothic was in reality far more gradual and complex and occurred in different media at different times; nevertheless, the tradition is still useful in illustrating two characteristics of English Gothic art: 1) it remained first and foremost an architectural style, with innovation occurring first in architecture and subsequently spreading to the other arts; 2) it began as and remained a creative response to French developments.

The early Gothic style introduced at Canterbury was quickly modified to accord with English tastes through the addition of thick walls, linear surface patterns, strong color contrasts, and inhabited capitals, as at Wells (1180–90). The introduction of the Decorated style (ca. 1290) and Perpendicular style (ca. 1350) can also be understood as English responses to the French high Gothic and Rayonnant styles. English artists and architects, however, never adopted these French styles wholeheartedly but rather selected specific elements to include in what remained basically insular designs. Designs or motifs used for such monuments as Westminster Abbey or the Eleanor crosses are often associated with the desire of English kings to emulate the splendor of the French court rather than with the desire of English artists to copy the styles of France.

Architecture remained important throughout the Gothic period, not only because it was the primary locus of artistic innovation, but also because it provided the setting in which all other forms of art were viewed or used. Gothic art is in many ways performative, with the church and its furnishings focused on the performance of the liturgy and the great hall with its furnishings and grounds designed for the rituals of court culture (tournaments, Round Tables, etc.). While the nature of the rituals may have differed, both church and hall were united as stages for costly and ostentatious display. Both were embellished with sculpture, painting, wall hangings, and objects of precious metal. The two were never completely separated, and from the 13th century to the end of the 15th century court culture had an enormous influence on all the arts.

The Gothic church was conceived as the kingdom of heaven on earth. In its architecture and decoration it presented a taste of what the devout Christian could expect in the heavenly Jerusalem. The cathedrals of the 13th and 14th centuries were brighter and more open than their Romanesque predecessors. Inside the nave the vertical lines of the supports, the pointed arches, and the

high groin vaults moved the eye upward to heaven. The vertical emphasis was heightened in the 14th century by the addition of impressive crossing towers, as at Salisbury (ca. 1328) or Ely (1322–34), or by the addition of soaring towers to the west facade, as at Beverley, Yorkshire (1380–1420).

The architectural innovations of the Gothic style, which reduced the supporting structure of the building to its basic skeleton (a feature never as pronounced in England as it was in France), also allowed for an increase in the number and size of windows. The colors of the stained glass filling the windows transformed the sunlight of this world into multicolored jewellike light symbolic of the divine light of heaven. The scenes and figures depicted could also serve a didactic function, illustrating biblical stories and saints' lives or providing moral, religious, or even political instruction to a generally illiterate congregation. The complex compositions of the figural narratives and tracery patterns reach their climax in the great east window of Gloucester Cathedral choir (ca. 1351–67), literally a wall of glass. The delicate tracery patterns of the window here spread to cover the surfaces of the elevation and vault, suggesting a delicate metalwork reliquary.

Liturgically and visually the east end was the dramatic culmination of the Gothic church, the focus not only of the mass, but also the location of shrines, altars, relics, and the tombs of the aristocracy. In the great cathedrals the clergy was separated from the laity by a carved stone or wooden screen, between choir and nave. The screen could be elaborately embellished with gables, niches, sculpture, and painting. The shrine of St. Albans (1305–08) was a miniature architectural monument with gables, arcades, and figural sculpture, the whole made more sumptuous by the addition of paint and gilding. The liturgical vessels ([figs. 87–88](#): see LITURGICAL VESSELS) and manuscripts used during services were not kept on permanent display but did play an important role within the mass. Their bright colors and precious materials were echoed in the vestments of the clergy.

The liturgical significance of the east end of the church was often articulated by the addition of painted or sculpted details. At St. Albans paintings on the nave supports marked the position of altars. In the angel roof of the chancel of All Saints, York (ca. 1470), the angel Gabriel and Mary were painted flanking the altar and its rood, connecting the Annunciation with the Crucifixion and providing visual punctuation for the liturgical drama. In the same church the fifteen signs of Doomsday depicted in the stained-glass windows related to the Doomsday play.

Angel roofs and choirs provided a celestial orchestra for the holy figures sculpted or painted in and around the east end of the church, as well as for the liturgical performance below. The angels carved on the roof bosses and around the high altar in the Gloucester choir accompany the celestial hierarchy of

figures depicted in the east window—in descending order: stars and angels; Christ, Mary, and the apostles; abbots and bishops; shields, kings, and nobles. Christ and Mary are elegant crowned figures, king and queen of their heavenly court. The iconography reflects both the growth in the cult of the Virgin Mary and the influence of court culture and contemporary social hierarchy on art. Indeed art mirrored and helped to construct the society in which it was produced; commissioned by and for a wealthy ecclesiastical and aristocratic elite, Mary, Christ, and the saints became elegant courtly figures covered in rich robes and jewels, maintaining control over the misbehavior and ignorance of the lower classes occupying the more marginal areas of the church, such as the misericords.

Both the art produced for the secular aristocracy, as well as the aristocracy itself, looked backward for many of their images to a lost and mythologized golden age of King Arthur and his knights. At the same time, however, they looked to the contemporary French court for stylistic innovation. These two influences combined to create an art that at first glance dwells on nostalgic fantasy but that on closer inspection can be read as political propaganda advocating strength and loyalty to ones lord and country. The Chertsey Tiles (ca. 1250–70), with their scenes of battling knights ([fig. 140](#): see [TILES](#)) and episodes from the story of Tristan and Isolde; the drawings of a king, knight, and squire added to the Westminster Psalter ca. 1250; the paintings commissioned by Henry III and Edward I for the Painted Chamber at Westminster, which included figures of the virtues and vices and good and bad kings—all centered on the theme of loyalty and virtuous kingship.

Art in a variety of media came together in the tournaments, or Round Tables, held throughout the 13th and 14th centuries. The tournament not only took place against a backdrop of castle and garden, but required theatrical sets, elaborate costumes, banners, jewels, and furnishings for the feast. Folio 202v of the Luttrell Psalter of ca. 1325–35 (BL Add. 42130) depicts Sir Geoffrey Luttrell being armed for the tournament; the theme receives a comic turn in manuscript marginalia and misericords, such as the ca. 1379 misericord with two jousting knights at Worcester Cathedral. The taste for Arthuriana and the merging of art and life culminated in Edward IV's building of St. George's Chapel at Windsor Castle (1475–1511) as the seat for the Order of the Garter, an order founded by Edward III in 1348 after his military victories in France.

While art produced by and for courtly society in the late 14th and 15th centuries stressed loyalty to king and country above all, it also manifested an increasing emphasis on personal identity, experience, and lineage. This is most clearly exemplified by the proliferation of heraldic devices in all media. Coats of arms decorated the borders of manuscripts, gables, roof bosses, and floor pavements (e.g., the shield-bearing angels in Westminster Hall), stained glass,

and monumental tomb brasses (e.g., the 1375 brass of Robert of Wyvil, bishop of Salisbury, in Salisbury Cathedral). Devotion also became more personal. Funerary chapels, elaborate tombs, and memorial brasses became more common and were produced for a wider range of patrons. Books of hours, designed for private devotion and decorated with personalized imagery, also flourished. The emphasis on identity and lineage may be connected to the devastation caused by plague, war, and social unrest and to the increasing power and prominence of the wealthy professional class. The importance of middle-class patronage is evident not only in its demand for traditional aristocratic monuments, such as manuscripts and memorials, but also in its development of new forms of architecture, such as the pseudo-castle and the guildhall.

The Gothic era is also characterized by an increased presence and prominence of the artist. Records of artists' names are far more common; we know much, for example, of Matthew Paris, William de Brailes, William Ramsey, Henry Yevele, and Herman Scheerre, to name but a few. Monastic artists like Matthew Paris, and monastic scriptoria in general remained important throughout the period. However, it was the lay artist and the lay workshop that acquired real prominence.

The rise of the lay artist resulted from a complex range of historical and social factors. Prominent among them was the great increase in the number and range of works of art required in all media. The rise of the universities of Oxford and Cambridge in the 12th and 13th centuries, and the development of a middle class of merchants and other professionals in the 14th and 15th centuries, created new patrons with new requirements. Books for scholars and students had to be usable in a way that grand liturgical manuscripts did not. University buildings, commercial buildings, and the homes of the middle class demanded new architectural solutions. Artists responded to these increased demands by establishing specialized workshops in which there was a specialization of labor and industrialization of production achieved through the use of model books, exemplars, booklets, templates, and design treatises. The changes appear first in the workshops producing illuminated manuscripts, such as the ca. 1230–60 workshop of William de Brailes at Oxford, but soon spread to other media. By the late 14th century workshops of sculptors, painters, goldsmiths, masons, and architects were located throughout England, with particularly prominent workshops centered on the court in London.

The social status of artists increased accordingly. The hierarchy within the workshop reflected that of society, with an elite group of masters directing a usually anonymous group of artisans and apprentices. In fact many of the most prominent masters became members of the new moneyed elite. In the late 1330s William Ramsey, the king's chief mason, had the use of his own seal and

coat of arms. Henry Yevele, architect of Westminster Palace, Westminster Abbey, and St. Paul's Cathedral from 1360 to 1400, held the rank of esquire and owned two country homes and substantial property in London. Yevele was not only an accomplished architect but also a shrewd businessman, directing workshops of both masons and sculptors as well as working as contractor and supplier of building materials.

With the increase in artistic production and the secularization of all art forms during the Gothic era it is tempting to see in the period the beginnings of a sense of art for art's sake, but this is misleading. The meaning of monuments and images continued to take prominence over visual form. Arthurian romances were lessons in virtuous behavior, the beauty and elegance of Mary and Christ symbolized their divinity, the magnificence of church and shrine were reflected in the strength of the church and the beauty of heaven. The preeminence of the message and the necessity of relaying and interpreting it correctly were driven home by the Lollards in the late 14th century. They, like St. Jerome, the Byzantine iconoclasts, and Bernard of Clairvaux before them, stressed the danger of art: beauty could seduce and corrupt as easily as it could instruct. Why, they asked, show the saints and apostles who had lived lives of poverty and suffering as though they had lived in luxury? Did not art run the risk of promoting worldly wealth and the desires of mortal men and women over the spiritual power of the image? Their views were echoed by Thomas Cromwell in 1538, and while the impact of the Lollards on art may have been limited, the impact of the Reformation was not.

Art, Pictish

Our name for the Picts derives from *Picti*, Roman soldiers' slang for a "painted people" who may have worn tattoos at an early date. Apparent descendants of the earlier Caledonians, they lived in those areas of Scotland east of the watershed that defines the West Highlands and north of the Firth of Forth, extending into the Orkney and Shetland Islands. The meager evidence suggests that their language was a mixture of non-Indo-European and Celtic elements, in varying proportions throughout Pictland. They were unified under a single king by the late 6th century and combined their crown with that of the Scots in the mid-9th century. Their former territory is indicated by various criteria, including place-names beginning in *Pit-* and the locations of their distinctive sculptures. Although Pictish metalwork survives, their sculpture is their most important artistic legacy.

Fig. 16. Pictish Class I symbol stone, St. Peter's Church, South Ronaldsay, Orkney, (a) front, (b) back. Currently in the National Museum of Scotland, Edinburgh. After J. Romilly Allen (1903). Drawing by C. Karkov.

Pictish sculpture is divided into Classes I, II, and III. Class I ([fig. 16](#)) comprises rough stone slabs, set upright and incised with geometric symbols, unique to the Picts, or with depictions of animals. The origins of the two most popular symbols, known as the Crescent and V-rod and Double-Disc and Z-rod, remain unknown, although among the other examples, the so-called Tuning-fork symbol may be a stylized representation of an Iron Age Celtic sword. Depictions of the sea eagle, salmon, boar, bull, wolf, stag, and snake are also found in Class I, in addition to the fantastic animal known as the Pictish Beast. The best Class I carvings feature Celtic decoration inside the geometric symbols and interior body scrolls and volutes on the animal figures, suggestive of lost predecessors in *repoussé* metalwork.

Quality is equated with originality among Pictish symbol stones, and their initial creation is therefore placed in northern Pictland, along the shores of the

Moray Firth, extending northward to Orkney. Class I is broadly contemporary with the inscribed memorial stones and incised crosses found in Celtic areas of Britain and Ireland and may have shared a similar function, although its original purpose remains a source of debate. Burials, however, have occasionally been found associated with symbol stones. There is no agreement over the dating of the origins of the symbol series in stone, with proposals ranging from the 6th century to the late 7th.

The Hebridean monastery of Iona introduced the Picts to Christianity by the 7th century. But in the early 8th century the Pictish king Nechtan realigned himself with the romanizing trend in Northumbria and requested the loan of Anglo-Saxon masons from Jarrow to build a stone church "in the Roman manner." The church no longer exists, but the new Pictish knowledge of stonemasonry techniques led to the emergence of Class II Pictish sculpture: finely dressed slabs carved in relief, bearing both the cross and Pictish symbols, usually on opposite sides. Whatever Pictish symbols meant, they were compatible with Christianity. The new Class II monumental form developed in southern Pictland, near the north shore of the Firth of Tay, with examples at Glamis and Aberlemno. Conflicting views of the dating of early Class II place it either in the early 8th century, by analogy with contemporary relief cross slabs in Northumbria, or in the second half of the century.

Early Class II cross slabs are carved in low relief. Disagreement over their dates reflects the different dating schemes proposed for the higher relief of the second phase of Class II, which are aggravated by the connections between a group of stone crosses carved at Iona and contemporary sculpture in Pictland, including the southern Pictish St. Andrews Sarcophagus and the northern Pictish cross slab at Nigg. David iconography proved especially popular in Pictland, where it may have had royal associations, but it is mirrored at Iona, while rounded relief bosses, surrounded by the modeled figures of snakes, occur both on the Iona crosses and in Pictish sculpture. Opposing arguments place the related Pictish and Iona examples in a series beginning in the mid-8th century or delay its development until the early 9th. But Iona imported stone from the Scottish mainland for its later crosses, a tremendous undertaking unlikely to have been attempted after 806, when Iona suffered its most devastating Viking attack. If the higher relief of the later Pictish Class II belongs to the second half of the 8th century, early Pictish cross slabs probably emerged nearer its beginning.

Fig. 17. Pictish Class II cross slab. St. Vigean's no. 1 (back). Courtesy of Carol A. Farr.

Despite the unification of the Picts and Scots in the mid-9th century, characteristically Pictish sculpture enjoyed local patronage for a few more generations. Major southern Pictish collections at Meikle and St. Vigean's ([fig.](#)

17) may span the whole of the 9th century, while northern cross slabs at Rosemarkie and Shandwick are among the finest examples of late Class II. The distinctive Pictish symbols were finally abandoned in the relief sculpture of Class III, at a time when the Picts were gradually subsumed within the Gaelic-speaking culture of the Scots, even though the kings of the combined peoples occasionally bore Pictish names into the 10th century. The sculptured cross, rather than the cross slab, appeared at St. Andrews and the southern Dupplin Cross combines Scottish, Pictish, and Northumbrian features, but the vigor of late Pictish sculpture is best represented in the north by the enormous Sueno's Stone, a cross slab near Forres.

Art, Romanesque

The term "Romanesque" describes the cultural productions of western Europe in the 11th and 12th centuries. Seen from a modern vantage point, the characteristics that define the Romanesque—generally figures drawn or

sculpted with firmly demarcated outlines, massive buildings made of square-cut stone blocks, and decorated with monumental sculpture of the same material—cross national boundaries and therefore mark the first international artistic style since the Roman Empire. Formulated in the early 19th century, the term at first referred negatively or derisively to a particular medieval practice of building “in the manner of the Romans,” particularly the use of round arches. As the historical studies of this architecture and its cultural contexts developed, Romanesque art has come to be seen as driven by two simultaneous forces: the memory of a common, pan-European heritage of the Roman Empire, kept alive and motivated by medieval monastic culture; and a series of individual expressions of that memory, modified by the particular traditions and historical contexts of the various regions of Europe.

In English art the Romanesque period is roughly bracketed by the dates of ca. 1050 and ca. 1200. On one end of the temporal scale English Romanesque grows out of a mixture of Anglo-Saxon art, defined by a dynamic flow of lines and small-scale architecture, and the more severe style developed on the Continent, especially in Normandy. On the other end the Romanesque blends slowly into the refined and courtly attention to the shapes and textures of natural forms and the thin, soaring membranes of stone and stained glass that make up Gothic art and architecture. The fluid borders assigned to the Romanesque as an artistic period reflect the great losses of artwork over the last 800 years, losses that make a perfectly accurate description of influences and developments impossible. Its indeterminate chronological boundaries also mirror a growing awareness that general trends in art, such as stylistic development, result from a combination of complex forces that usually are not as readily datable as the beginning of a king’s reign or the production of one particular work.

In broad and general terms English Romanesque art is dominated by the dense, regular, and imposing frame provided by the massive volumes and stocky proportions of architecture. The cathedrals and castles constructed in Romanesque England dwarf their Anglo-Saxon predecessors in number, size, and technical innovation. Following the Norman Conquest in 1066, King William and the continental abbots and bishops he appointed to English ecclesiastical positions replaced many venerable Anglo-Saxon churches, including Canterbury, Winchester, and Durham, with new and larger construction based on continental models. At the same time William and his successors built or authorized the building of stone castles, such as the Tower of London, at strategic locations. In looking toward the Continent they followed in a tradition started by King Edward the Confessor, who, in his construction of Westminster Abbey ca. 1050 (thought to be the first example of Romanesque architecture in England), seems to have borrowed from—and in

turn influenced—the great abbeys of Normandy. Westminster Abbey, the Norman abbeys, and the post-Conquest churches shared a similar aesthetic: these buildings massed together long horizontal spaces of nave and transept, dominated by two vertical towers at the corners of the facade and one at the crossing. Interiors were solid and heavy. Gigantic, massive piers supported masonry walls that were divided into two, and sometimes three, distinct parts. In these early buildings side aisles were vaulted in stone, while the nave was covered by a timbered roof. Many of these projects ambitiously enclosed unprecedented amounts of space, rivaling and even surpassing the great cathedrals and abbeys on the Continent. The cathedral at Durham (figs. 52–53: see DURHAM CATHEDRAL) presents the first known Romanesque construction planned from its inception to be completely covered with stone vaults.

The architecture provided an overriding frame for decoration—generating an interest in monumental sculptural designs not seen in Europe since classical antiquity—which was concentrated around facades, doorways, and capitals. Although stone crosses and figured architectural decoration were sometimes sculpted in Anglo-Saxon England, Norman and other continental traditions provided important catalysts for English Romanesque designs, especially by inspiring the use of abstract geometric motifs, like the zig-zag chevrons applied to round arches or capitals carved with foliate motifs, human heads, or animals. The tympana—the hemispherical areas under the arched doorways in many churches—became important zones for sculpture, first for geometric patterns (Chepstow Castle, ca. 1070) and later with figural descriptions of religious scenes, such as Christ in Majesty, as at Rochester Cathedral. The arches surrounding the tympanum were often enriched with a wild menagerie of stylized vegetation, contorted animals, human heads, and “beakheads”—birdlike forms with long, dagger-shaped beaks, of which the parish churches at Kilpeck (fig. 76: see KILPECK) and Iffley preserve the outstanding examples. Unfortunately much of the sculptural decoration from the facades and interiors of churches has been lost, deliberately damaged, or blurred by weathering. Indeed one type of sculpture that we know must have existed in hundreds of examples—wooden crucifixes—is now almost completely lost.

Most of the surviving works in other media, such as metalwork, wall painting, and ivory carving, must be understood largely in terms of architecture too, as these objects would have been seen in the context of ecclesiastical ceremonies taking place within the newly constructed churches. Wall painting, much of it now destroyed or covered up by subsequent work, would have complemented and continued the sculptural programs of many churches and provided a visual reference for didactic messages aimed at the church congregation. The entire program of painting, sculpture, and architecture was directed toward the rites of worship contained within; rites

that included the use of elaborately decorated patens, chalices, and ciboria constructed of precious metals, ivory, and enamels. The Gloucester Candlestick (fig. 67: see GLOUCESTER CANDLESTICK), commissioned 1107–13 and probably intended for use on or near the altar, is perhaps the most dramatic—and the only firmly datable—surviving example of the metalwork craft. Work of equal brilliance and virtuosity but intended for secular social rituals may have once existed; only a few items (drinking cups, finger rings, etc.) are known today.

In one area at least, illuminated manuscripts, we can manage to glimpse Romanesque art in a relatively unfaded, unweathered manner. In manuscripts as in buildings, paintings and drawings were organized around an architecture created by the linear flow of the text and the series of rectangular spaces created by the open book. Elaborate painted initials, another artistic idea imported from Normandy, marked the beginnings of important sections of manuscripts. These initials often combined human, animal, and hybrid (half-man/half-animal or two kinds of animals together) caught in a dense, flowing mass of vegetation. The meaning of the inhabited initials—“haunted tanglewoods” as they have been called—sometimes seems directly linked to the text that follows; other times a general meaning, linked to a monastic view of the world as a place of struggle and contention, can be attributed to the laboring figures they contain.

Although initials continued to be an important part of manuscript decoration throughout the Romanesque, English manuscripts develop a strong interest in pictorial narrative. Pictures supply the “architecture” of a story; that is, they provide narrative pillars that ground and support a reading of a text. The first extended series of narrative images that we know of, a manuscript of the *Life of St. Cuthbert* (Oxford, University College 165) from around the beginning of the 11th century, has miniatures placed alongside the text they illustrate, as a kind of visual recapitulation or extension of the story. By the second and third decades of the 11th century visual narrative becomes more independent of the text, allowed to develop a story’s architecture in its own terms, as in the St. Albans Psalter (Hildesheim, St. Godehard) and the *Life of St. Edmund* (New York, Pierpont Morgan Library 736), where single scenes fill the entire space of the rectangular folio, causing the narrative to flow and ebb as the reader turns the pages of the manuscript and stops to look at a picture.

In addition to narrative, English Romanesque art by mid-century exhibits several distinctive trends. Regional schools of sculpture developed in Yorkshire and Herefordshire; the small churches at Shobdon and Kilpeck are particularly rewarding examples of how ideas and forms initiated at larger English or continental centers could be extended and transformed to fit the needs of a particular location. In a similar fashion individual artists, such as Master Hugo, who painted a Bible for the Abbey of Bury St. Edmunds (Cambridge, Corpus

Christi College 2), could fuse continental, English, and Byzantine ways of painting drapery into the distinctive and dynamic patterns known as the “damp-fold.” The damp-fold became an artistic convention used by carvers and metalworkers. Drapery clings to the figures modeling the curving forms of legs, thighs, and abdomens through long and graceful S-curves or tightly nested, stylized ridges.

The fact that conventions depicting drapery, such as the damp-fold style, or even ways of representing plants and plant forms were used in several kinds of media raises the question of who was responsible for their creation. Early in the Romanesque most of the work was perhaps done by the monks themselves, as similarities between foliage types from Canterbury manuscripts and some capitals from Normandy show. Later, laypeople began to be responsible for producing metalwork, carving, and painting. Some, like Master Hugo of Bury St. Edmunds, worked skillfully in different media. Others perhaps specialized in only one or two. Some of these artists could have been laypeople associated with a particular monastery or patron for a long period of time; some, like Anketyl of St. Albans, were actual members of the monastic community, while others moved from job to job. By the 1180s at least a loose association of goldsmiths existed in London, witnessing the possibilities for an artisan’s independent employment.

If an artist may have become slightly less dependent on one particular church or monastery, the work produced would still have been tightly bound to the needs of an increasingly hierarchical, centralized, and interdependent English church and lay aristocracy. The small parish church at Elkstone, Gloucester (constructed ca. 1160–70), served the need of the local lord and those who worked his estates in the surrounding area. Like many local churches from the 12th century it is built of the same square-cut ashlar found in the larger, richer cathedrals. Over its south door—the principal entrance to the church—a carved tympanum depicts a theme commonly found over the doorways of the facades of monastic and cathedral churches like Rochester, Christ in Majesty, here surrounded by beakheads and grotesques similar to those at Kilpeck. All in all the church and doorway are conventional, a product of national and international trends. At Elkstone, however, on the upper right-hand corner, the artist has mistakenly replaced the angel that symbolizes Matthew with the Agnus Dei, the Lamb of God. By moving the angel to the lower right margin, the artist, consciously or unconsciously, associates the Lamb, symbolizing the earthly church, more closely with the central, in this case celestial, authority. Although the scene is derived from the written text of Revelation, the viewer does not need to be literate to understand it. Christ, frontal and unmoving, sits in judgment, his memory aided by the book in his hands, by his scroll-bearing servants, and by the symbolic presence of the

church. For kings and other 12th-century lords the use and control of the book correlated to the efficient exercise of political power. Placed on the threshold of the church, the divinely inspired vision of Christs majesty, sculpted by human hands, proclaims and reinforces the privileged bonds forged between the secular authority who would have paid for and owned the building, and the church, represented by the priest who performed in its spaces. The tympanum reminds us that the art and artifacts that have survived from the late 11th and 12th centuries must be seen not only in terms of stylistic development but as a result of and as integral to how these bonds between social actors were forged.

Art, Viking Age

The Viking Age in England may be said to begin with the conquest of Anglo-Saxon York in 867 and to end with the fall of the Scandinavian kingdom of York in 954. But Scandinavian influence on Anglo-Saxon England and Anglo-Saxon art continued into the 11th century. The 10th century in particular saw a flowering of stone sculpture in the north, primarily in Yorkshire and Cumbria, the areas of Scandinavian settlement. The Vikings appear to have had relatively little impact on art in other media, except possibly in metalwork.

Fig. 18. Gosforth Cross, Cumbria, southeast side. Courtesy of A.J. Hawkes.

Four Scandinavian styles had an influence on pre-Conquest art in England: Borre, Jelling, Mammen, and Ringerike. Borre (mid-9th to late 10th century) is characterized by a ribbon-shaped gripping beast and ring-chain motif. It does

not appear to be found in England in its pure form, although the ring-chain pattern seen on such monuments as the Gosforth Cross (figs. 18–19) may represent an Anglo-Scandinavian version of the style. The looping ribbon and foliate patterns of Scandinavian Borre also had a limited influence on metalwork, such as the Saffron Walden pendant (Saffron Walden Museum), and a late-9th-century one-piece disc brooch from the River Cam (London, BM, MLA 1985, 7–2, 1).

The Jelling style (late-9th to late-10th century) is the most popular of all the Scandinavian styles in England. Its characteristic motif is a double-contoured, often S-shaped ribbon animal, frequently with a curling pigtail and/or lip. Fine examples of Jelling-style beasts are found on the York Newgate cross-shaft and on a fragmentary slab from Coppergate, York. Although profoundly influential on Viking Age sculpture in England, the style had little influence on metalwork—though crude Jelling beasts decorate the early-10th-century silver niello roof-piece from a houseshaped casket in the British Museum (MLA 1954).

Mammen (ca. 960–1020) is relatively rare in England. Its characteristic motif is a double-contoured animal with liplappet and pigtail, often difficult to distinguish from the Jelling beast. The main difference is that Mammen beasts are fuller and heavier than their Jelling predecessors. The body of the animal may or may not be filled with pelleting. A typically Mammen beast survives on a cross-shaft from Workington, Cumbria. The style is not found in metalwork in England.

Fig. 19. Gosforth Cross, Cumbria, west side. Courtesy of A.J. Hawkes.

Ringerike is the last of the Scandinavian styles to have a significant influence on art in England. It is also noteworthy for having been developed under the influence of the Winchester style. Popular from ca. 980 to the

mid-11th century,, the style is typified by the addition of curling tendrils and foliate patterns to the Jelling-Mammen beast. Unlike the earlier “Viking Age” styles Ringerike was more popular in the south than in the north and is generally connected with the reign of the Danish king Cnut. The most famous example of the style to survive in sculpture is the end slab of a sarcophagus from St. Pauls, London (Museum of London). It is also seen in metalwork (e.g., the stirrup from Seagry, Wiltshire [Devizes Museum 49/1979]). It is the only one of the Scandinavian styles to be found in manuscript illumination. Ringerike designs can be seen in the architectural frames of the drawings on pp. 56 and 57 and on the blank end page of the “Cædmon” Genesis (Bodl. Junius 11), as well as in the decorative initials of a psalter in CUL Ff. 1.23.

Viking Age art is characterized by more than simple stylistic considerations, particularly in the area of stone sculpture. In general Viking Age sculpture in the north was transformed from a primarily monastic to a primarily lay art. New types of monuments appear, most notably the “hogback,” a memorial stone or grave marker similar in shape to Scandinavian buildings (although it is also possible that the shape of the hogback was influenced by that of Anglo-Saxon tombs and shrines). Tegullated roofs (roofs carved to look like roof-tiles) and/or roof ridges and bearlike end beasts are often carved on the stones. A variety of scenes and motifs decorate the long sides, some of purely Scandinavian nature (e.g., the Viking ship and world serpent on the Lowther [Cumbria] hogback).

The amount of Viking Age sculpture that survives in the north is somewhat surprising, as the areas from which the settlers came did not have a tradition of stone sculpture. Nevertheless, the Scandinavians were quick to adapt, decorating a typically Anglian and Christian form of monument—the freestanding stone cross—with scenes from Scandinavian mythology (Ragnarok, Sigurd, Weland the Smith); combining Christian and pagan scenes on a single monument, as at Gosforth, where the Crucifixion appears in the midst of a Scandinavian pantheon; or placing monuments with pagan scenes in Christian spaces, such as churchyards and cemeteries.

The appearance of ring-headed crosses in northern England at this time may be further proof of the Vikings’ ability to assimilate. Ring-headed crosses are characteristic of Ireland and the Celtic areas of Britain, and may have been introduced to the Scandinavian settlers in England by their Irish counterparts.

Possibly under the influence of Irish metalwork Viking Age sculptors in England developed a method of laying out their designs on grids, sometimes with the aid of templates. Speaking of one of the York Minster shafts (York Minster 2), Jim Lang notes that the designs carved on the shaft are “rigidly symmetrical” and that “posture, angle, scrolls, crossings and direction of line rely upon the grid” (1986: 257). He suggests that this feature, more than any

other, distinguishes Viking Age art in England and the British Isles from Viking art elsewhere.

Asser (d. 909)

Biographer of Alfred the Great. Asser's *Life of King Alfred* survived into modern times only in BL Cotton Otho A.xii, dated by Wanley ca. 1000, burned in the Cotton Library fire of 23 October 1731, and now represented by a facsimile from Wise's edition of 1722 and transcripts at Corpus Christi College, Cambridge. The work was used certainly by Byrhtferth of Ramsey ca. 1000 and

probably by the author of the *Encomium Emmae reginae* in the 1040s. Among other Alfredian titles in the list of books presented by Bishop Leofric to Exeter before 1072 the item *Liber Oserii* may refer to it. It was used by Florence of Worcester (d. 1118) or John (fl. 1140), whose work was used by Simeon of Durham; Simeon also incorporated Byrhtferth's work into his history. Early in the 12th century the compiler of the Annals of St. Neots drew material from Asser not found in John's work and preserved better readings than those found in the Cotton manuscript.

In his account of the year 884 Asser states that he was summoned "from the western and furthest ends of Britain to Saxony," from Dyfed in Wales to Sussex in England, to meet Alfred at Dene, where the king asked him to join his household. When Asser replied that he could not abandon the place where he had been nourished, taught, tonsured, and ordained, Alfred suggested that he spend six months with him and six in Wales. Departing on the fourth day, Asser contracted a fever in Caerwent from which he suffered for 53 weeks. After recovering he returned to Alfred with the "counsel and license of all our people," in hopes of protection for the church at St. David's from King Hemeid, who had expelled Asser's kinsman "Archbishop Nobis." Asser remained at Leonaforð for eight months, reading to the king. By St. Martins Day, 11 November 887, the king had learned to read and translate Latin. In 893 Asser wrote his biography, based upon his Latin translation of the Anglo-Saxon Chronicle and complemented with eyewitness accounts.

Asser presented Alfred as a Christian king modeled explicitly after Solomon and implicitly after Charlemagne. He adapted the genealogy found in the West Saxon regnal table from the pattern of Matthew 1:1-17 (A begat B) to a Solomonic pattern based upon the opening chapters of 1 Chronicles (the sons of A were B, C, D). Asser's stories about Alfred's character, behavior, administration, and inventions all follow the pattern of Solomon's career in Kings and Chronicles, sometimes in the very diction of the Latin Bible. Because of the alleged regnal anointing by the pope in 853 Alfred had been in 893 a king for the Solomonic span of 40 years. There is one chapter of Asser's *Life* for every year of Alfred's life, 45 in 893.

Asser implies by the structure of his narrative that the most important of Alfred's learned clerical assistants were Grimbald the Frank, John the Old Saxon, and himself. He was closely involved in the Alfredian translations of works by Orosius, Gregory the Great, and Boethius. His *Life*, together with Alfred's preface to the *Hierdebooc* (the OE translation of Gregory the Great's *Pastoral Care*), provides the clearest evidence of the origin and scope of the king's educational program.

In recognition of service Alfred made Asser abbot of Cungresbyri and Banuwille. He gave him Exeter "with the whole parish belonging to it" and

later made him bishop of Sherborne. Asser's name appears among witnesses to early-10th-century charters. The Anglo-Saxon Chronicle records his death under the year 909.

Assize of Clarendon

In 1166 Henry II, with the assent of his barons meeting at Clarendon, decreed procedural rules that proved to be a turning point in English criminal jurisdiction. The procedures were modified in the light of experience, and the provisions reinforced at a council of Northampton in 1176, but it was as the “Assize of Clarendon” that the key features of royal criminal justice came to be known.

The Assize (that is, this set of procedural rules) required systematic inquiries

into allegations of serious crimes and the use of juries of trustworthy local men to identify suspects. Those named by the juries were to be arrested and detained pending trial. Only one of the customary forms of trial, the ordeal of water, was to be allowed to those so accused; the chattels of the guilty were forfeit to the crown. The inquiries and the arrest of suspects were not to be impeded by the holders of privileged jurisdictions. The procedures were to be monitored and the trial of the accused to be conducted before the newly instituted itinerant royal justices.

In practice the royal justices refined the procedures, “considering the probable facts and possible conjectures both for and against the accused, who must as a result be either absolved entirely or purge himself by the ordeal” (Glanville 14.1).

The importance of the Assize was threefold: first, it cut through a thicket of custom and private jurisdiction to establish a common law for the realm as a whole; second, the crown assumed direct involvement in the prosecution of serious crime; but third, an indictment by a jury was required to initiate prosecution. This “jury of presentment,” besides involving the local community in law enforcement, was a major safeguard against unwarranted prosecution and has survived in the form of the “grand jury” into modern times.

Assize of Weights and Measures

Although the Anglo-Saxon kings urged the use of just weights and measures and pointed to particular standards in their keeping, they did not copy or distribute such standards. With the growth of trade in the high Middle Ages, however, the Angevin kings began to regulate more systematically the wide variety of weights and measures employed throughout the realm. They promulgated laws, such as the Assize of Measures of 1196, which attempted to impose uniform weights and measures and to hold up certain standards, such as those of London, as models. They and their successors also had royal standards duplicated and sent out to counties and urban centers as models for local traders. The mounting legislation concerning the sale of specific commodities (like the Assize of Bread and Ale, 1266, and the various enactments for Alnage, or official measure, of cloth) included explicit provisions as to the proper weights and measures to be employed. But the frequency and repetitiveness of this legislation indicate that efforts to establish uniformity were often disregarded.

Although the king's Clerk of the Market maintained the royal standard measures and the king's commissioners could be empowered to inspect measures and punish wrongdoers, local government handled the bulk of enforcement through leet courts (the annual courts of manors and hundreds). Boroughs regularly held an assay of weights and measures to compare the measures of local traders to the town's standards. Violators were punished by fines or by being put on the pillory. Near the end of the Middle Ages certain guilds also received the right to regulate measures used in their trade. In the countryside the power of local custom dictated a wide variety of weights and measures that proved resistant to the central authority's efforts to impose uniformity.

Astrology

In its medieval definition “astrology” meant “knowledge of the stars” (Gk. *astron*, star; *logos*, knowledge), and the word was used interchangeably with “astronomy.” This usage can be confusing today; when Chaucer refers to the Physician’s good grounding in “astronomye” he really means astrology in its modern sense. In our usage today “astronomy” concerns “factual” data on the stars, such as size or distance from the earth, in the tradition of Ptolemy’s *Almagest* (ca. A.D. 127). “Astrology,” in modern usage, concerns the “laws” of influence emanating from those stars in the macrocosm, especially over human life in the microcosm it governs. Ptolemy also dealt with such influences, and his *Tetrabiblos* was the basis for all later astrological works.

According to medieval astronomical theory seven planets orbit the earth, the first being the Moon; earthly matters are called “sublunary.” Next come Mercury, Venus, the Sun, Mars, Jupiter, and Saturn. Finally come the fixed stars and *primum mobile* (prime mover: moving itself, rather than controlled by forces beyond this sphere) to establish the fixed positions by which the movements of the planets are measured and the initial impetus for their orbits around the earth is given.

The fixed stars include groups that define the twelve signs of the zodiac. The planets move through these signs, with the sun entering Aries in March, followed by Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricorn, Aquarius, and Pisces in the succeeding months. The zodiacal signs and planets have natural qualities—cold, dry, hot, moist—based upon the four elements of earth, air, fire, and water. However, their movements cause such qualities to mutate according to their relation to the earth and other planets at any given moment.

“Aspect” is the most important determinant, identifying planetary and zodiacal relationships geometrically, that is, whether two or more bodies are square to each other, opposite, or in some other arrangement. Influences are greatest when planets are in the *auge*, or highest point above the earth, least when they are moving retrograde. The ruling planets and signs are those in a particular position at a given time, the most important for horoscopes being those in the “ascendant.”

A person born under the sign of Aries would have been born with Aries rising at the eastern point of intersection of the horizon and the ecliptic at the moment of nativity, on the cusp (or entrance) of the first of the twelve mundane houses. The person’s physical appearance, personality, and destiny would be determined by Aries’s qualities (hot, dry, mobile, and masculine), as well as by the signs and planets positioned in various aspects throughout the remaining mundane houses to determine the future regarding such matters as marriage, illness, riches, and travel. A knowledge of the data provided by astronomy and of the laws of judicial astrology make it possible to assess the

advisability (or otherwise) of human activities, as well as to predict the outcome of any event, even of life itself.

Latin and vernacular astrological treatises and related works represent a high proportion of surviving medieval scientific literature, perhaps 30 percent. In addition to Albumasar's *Introductorium* and other adaptations of Ptolemy other Latin works circulated widely: Albertus Magnus used Albumasar (786–866) for his *Speculum astronomie* (ca. 1250), Michael Scot for the *Liber introductorius* (ca. 1230), and John of Eschenden for his astrological *Summa* (ca. 1348). Richard of Wallingford, abbot of St. Albans, adapted Albumasar's *Flores astrologia* for his *Exafrenon* (ca. 1318). Alhazens *Opus astronomicum*, Alchindus's *Judicia*, and Messahalla's *De judiciis astrorum* were, like Albumasar's works, first translated from Arabic at Toledo and were instrumental in the formation and transmission of astrological theory. Such theories also incorporated aspects of Aristotelian physics and meteorology, pseudo-Aristotelian and Galenic humoral theory, and Hippocratic medicine.

Astrological theory is represented in many vernacular translations—Aschenden and Wallingford were in English by the early 15th century—and adaptations. *The Wise Book of Astronomy and Philosophy*, a compendium of Albumasar and others, alone circulated in at least 28 manuscripts. At the applied level prognostic works on every subject from human fate to tree grafting were enormously popular and circulated well into the 16th century, when printed almanacs began to prevail for those seeking this sort of information.

Attainder and Forfeiture

Treason was defined in the Statute of Treasons (1352) and extended by later statutes and legal judgments. The most shocking of crimes, it carried the most serious of penalties: the execution of the offender, in the most painful and dishonorable way possible (disemboweling, drawing, hanging, and finally quartering), and the confiscation of his possessions. Forfeiture affected not just the traitor himself but his wife and heirs. It was developed and extended into the full-blown concept of attainder in 1459. Treason, it was argued, was so heinous that it corrupted or *tainted* the blood not only of the traitor but of his descendants so that they too were unable to inherit.

In the 13th century Bracton held harsh views akin to this formulation of attainder, but for a long time lawmakers took a more lenient view. Traitors did indeed suffer forfeiture of movable goods and estates held in fee simple, and their wives lost their dowers, but property held in trust (uses) was exempt until 1388, as were the wives' own inheritances and lands held jointly with wives. In the 1320s and in 1398 Edward II and Richard II ignored such restraints upon their vengeance, but it was not until the Wars of the Roses that acts of attainder sought to obliterate rival houses and families by the complete and permanent confiscation of estates.

This was the object of the bill of 1459 against the supporters of Richard duke of York, which declared the treasonable conduct of those listed and enacted their forfeiture. It was the model for many other bills of attainder proposed by victorious factions against their enemies, some of which, as in 1461 and 1483,

proscribed hundreds of opponents. There was no need for evidence of guilt or for a trial, nor was there opportunity for a defense; parliament's acquiescence sufficed. Hence we have the employment of attainder in state trials designed to destroy those who may not have been traitors: the duke of Clarence in 1478, the earl of Warwick in 1499, the duke of Buckingham in 1521, and the countess of Salisbury in 1541.

Acts of attainder deprived those named and their heirs of lands, however held, and wives of dowers. Enormous quantities of land consequently passed to Edward IV in 1461 and Richard III in 1483, which they used to reward their supporters. Wives of traitors were allowed to retain their own inheritances or lands held jointly with their husbands, for it was normal practice to settle jointures on couples at marriage. Children could inherit property via their mothers. Thus the two dowager-countesses of Northumberland retained much of the Percy inheritance, despite the attainder of the 3rd earl in 1461, and passed it on in due course to the 4th earl.

But practice did not always accord with theory. Anxious to prevent wives from remitting money to husbands still at liberty, kings often took them and their lands in custody, perhaps consigning them to nunneries. Traitors' wives understandably found it difficult to prove their rights, to make royal favorites disgorge what they had seized, or to resist pressure to abandon their rights. The future Richard III managed to set aside the claims of Lady Hungerford, clung to the lands of the countess of Warwick, and terrified the countess of Oxford into surrendering her inheritance. Edward IV does not seem to have approved but saw no point in offending a powerful supporter (and his brother) merely to do justice to powerless old ladies.

York, Lancaster, Somerset, and Warwick are examples of peerages that were destroyed as their attainders intended. But they were the exception. Most attainders were reversed, either by specific acts of reversal or by grants under the great seal; relatively few remained in force. Of Edward IV's attainders, 64 percent were reversed before the end of his reign, and all those passed by Henry VII (1485–1509) between 1488 and 1495 were reversed by 1523.

There were several reasons for this. Successive political revolutions—1459, 1461, 1471, 1483, and 1485—revoked the attainders and restored the victims of their predecessors. Another factor was a general respect for the sanctity of inheritance and consequent distaste for permanent disinheritance. Often the heirs of traitors were less offensive and more useful than their fathers, especially when—like the 4th earl of Northumberland—they had inherited their mother's lands. When recipients of forfeitures died or when they or their heirs lost royal favor, the king often preferred to reverse the attainder rather than maintain their grants. The death of former Yorkists fighting for Warwick against Edward IV made it much easier for him to restore erstwhile

Lancastrians in 1471.

Victims were often well connected and able to exert influence at court; witness the success of the Percys and Lady Hungerford in saving more than their strict legal entitlements. Royal favorites like Edward IV's earl of Pembroke and Lord Hastings married their daughters to the heirs of attainted traitors and exerted influence to get them restored, thus providing for their daughters on the cheap. Marriage offered better security than forfeitures, which might be restored and were seen as insecure. Hence the increased willingness of recipients of forfeited property to come to terms with the attainted, to share the spoils, or to sell the lands back facilitated the reversal of attainders. Hence, too, the increasing willingness to strike a bargain in return for preventing a traitor from being attainted. This occurred even in 1461; it was commonplace by 1475. There was no need to attain a traitor if he could be satisfactorily punished and loyal followers better-rewarded without proceeding to such extremes.

Barring a few exceptions, generally the humbler and less important traitors, attainder increasingly became a means for the king to bind traitors and adherents alike and an opportunity for politicians to peddle their influence to their own advantage. If there were winners and losers, particularly in the short term, when whole generations of families were temporarily eclipsed or promoted, attainder and forfeiture did not in practice (as used to be thought) destroy the old nobility, radically redistribute lands, or drastically enhance the financial resources of the crown.

Augustine of Canterbury (d. by 609)

First archbishop of Canterbury. Little is known about Augustine's early life beyond the fact that he was a pupil of Felix, bishop of Messana in Italy, and subsequently a monk and then prior of St. Andrew's Monastery on the Caelian Hill, Rome.

In 596 Pope Gregory I selected Augustine to lead a mission of monks to convert the English. The political climate in England was favorable for the venture, since Kent enjoyed close contact with the Christian Franks; in particular Æthelberht of Kent, overlord of the English kings south of the Humber, had married a Frankish princess, Bertha, who practiced the faith with her own chaplain. Nevertheless, Æthelberht was initially wary of the missionaries, and he insisted on meeting them outdoors, where hostile magic could less easily harm him. Augustine and his companions met him on the Isle of Thanet, approaching (as Bede records) with a silver cross and an icon of Christ.

At first Augustine operated from the old Roman church of St. Martin, where Bertha had practiced her devotions, but by ca. 602–03 he had repaired another Roman church, which he dedicated to Christ (Christ Church, Canterbury). Nearby he began to construct a monastery (known initially as St. Peter's, subsequently as St. Augustine's), to become a necropolis for Kentish kings and archbishops. Augustine presumably founded a school at Canterbury to provide converts with the learning they needed as clerics. The books and materials he had brought were augmented by further dispatches from Rome. The impact of writing was rapidly felt in the political sphere also, for under Æthelberht the earliest written collection of Anglo-Saxon laws was produced.

Augustine is recorded as having astonishing success in winning converts; by Christmas 597, shortly after he had received episcopal consecration, 10,000 are reputed to have been baptized. Surviving correspondence reveals that he sought and received guidance from Gregory on the organization, rites, and practices of the infant church. Particularly notable is Gregory's advice that pagan temples not be destroyed but purified and rededicated to Christian service. Augustine did not manage to realize Gregory's ideals for the organization of an English church in northern and southern provinces, each with an archbishop and twelve bishops. He also failed to obtain the British (Celtic) church's recognition of his authority and their help in converting the English. Augustine's mission affected only the southeast of England, and the difficulties that beset the new church following the death of Æthelberht (in 616?) underline the extent to which the early successes had depended on the king's favor. But then Augustine did not have many years in which to work; he

died somewhere between 604 and 609.

Azarias

An OE poem of some 191 lines, found in the Exeter Book on fols. 53–5 5v. Some lines of the poem have been lost through the excision of about two and one-half inches from the top of fol. 53. This loss, coupled with the fact that there are many similarities between *Azarias* and the OE poem *Daniel*, has caused certain critics to view the poem as "no more than two sections of a long poem on the theme of Daniel, which may have told the whole story on much the same lines as that in the Junius MS" (Craigie, 1924: 11). There is an obvious connection between *Azarias* and lines 279–429 of *Daniel*, especially in terms of language, though no watertight claim can be made as to the exact nature of this relationship. Both poems celebrate God and his Creation, and perhaps the best that can be said is that they may have shared a common source. Another theory is that *Azarias* is really the ending to *Guthlac B*, though this view has

not gained widespread acceptance.

The composition, noted for its lyrical beauty, is in two main sections—the Song of Azarias and the Song of the Three Children uttered from the fiery furnace. The primary source for the poem is Daniel 3:24–94, though the poet does not follow the Vulgate version exactly. It has also been suggested that *Azarias* may be indebted to the Song of the Three Children as it appears in the Roman psalter.

Bacon, Roger (ca. 1213/19–1292)

Little is known of the origins of Roger Bacon, Franciscan philosopher and scientific thinker. He was born ca. 1213–19. His writings reveal his English origins: his birthplace is unknown. His family was well-off and scholarly, able to assist him in the buying of books and scientific instruments. Educated at Oxford and Paris, he received the degree of master of arts around 1240 and lectured on Aristotle's natural philosophy for many years.

Under the influence of the works of Grosseteste and Arab authors, Bacon devoted himself to the study of mathematics, and languages, including Greek and Hebrew. He also conducted observational experiments, especially in optics. He entered the Franciscan order in 1257 but found Franciscan attempts to censor his writings disturbing. He appealed to the future Pope Clement IV for assistance in the compilation of a great encyclopedia of the sciences. As a result of papal encouragement Bacon composed the *Opus maius*, *Opus minus*, and *Opus tertium*—works that described his proposed reform of education and society, criticized magic, suggested calendar reform, and emphasized the importance of scientific knowledge for Christianity.

For reasons not entirely clear to us his works were again condemned in 1278 by the head of his order, owing to “certain suspect novelties.” It is possible that his interest in alchemy, astrology, and the teachings of Joachim of Fiore, the Italian mystical preacher, led to his condemnation. As a result Bacon may have been imprisoned for several years, although he continued to study and write. His last work, *Compendium studii theologiae* (1292), still assailed the corruption of his day.

Although many of his works were forgotten after his death, Bacon was rediscovered in the Elizabethan period as a prototype of the modern “scientist.” Bacon's modernity now appears exaggerated; his experimentalism was very much in the medieval tradition, and his ultimate aim was the advancement of the new learning as a useful tool for religion. At the same time his enthusiastic support for and synthesis of the new science helped introduce it into European intellectual life.

Ballads, English and Scottish

Anonymous narrative rhymed poems, generally sung and part of the oral tradition. They were a product of the late Middle Ages, first collected by Bishop Thomas Percy (*Reliques of Ancient English Poetry*, 1765), the word “ballad” having been suggested to him by William Shenstone to separate songs of narrative action from those of “sentiment.” Francis Child assembled all 305 extant ballads in his collection *The English and Scottish Popular Ballads* (1882–98), giving his name to the “Child ballads”; he also assigned the numbers to ballads in the “Child canon” by which these songs are now universally recognized.

Only eight ballads in the Child canon can be dated before 1500. They are: “Judas” (Child no. 23; 1225–75); “Inter Diabolus et Virgo” (1; ca. 1450); “Robin Hood and the Monk” (119; 1450–1500); “Saint Stephen and Herod” (22; ca.

1450); “Robin Hood and Gandeleyne” (115; ca. 1450); “Robin Hood and the Potter” (121; ca. 1500); “A Gest of Robin Hood” (117; printed by Pynson ca. 1500); and “Adam Bell” (116; printed by Wynkyn de Worde ca. 1505). Three other poems not included by Child but recognized as ballads by recent scholars also fall into this time period: “I Have a Young Sister,” “The King and the Barker,” and the so-called “Corpus Christi Carol.”

The “medievalism” of ballads is subject to controversy. Some scholars feel that “Judas,” lacking a tune, is not a true ballad. However, the story is traditional, told in compact ballad style, and written in “fourteener” couplets (iambic heptameters), which, when divided into iambic tetrameters alternating with iambic trimeters, yield the traditional ballad stanza. We also know from *Piers Plowman* that Robin Hood rhymes were extant around 1375: Sloth boasts, “I can [= know] rymes of Robyn hood and Randolf erle of Chestre” (B.5.402). Some ballads recorded after 1500 appear to have origins in medieval romances and popular tales.

Ballads present a variety of topics: a few are of religious or romance origin; more common are ballads about outlaws, fairies, revenants (the dead returning to life), and the “Border ballads” (concerning raids across the northern “Debatable Land”). Most, like “Sir Patrick Spens” (Child no. 58), “Edward” (13), and “Lord Randal” (12), are local in origin; they often concern domestic violence and are composed in semi-isolated homogeneous communities by middle-class individuals (teachers, blacksmiths, etc.). Once accepted by the folk, the songs develop in oral tradition, being recreated in different cultural settings (thus the English “Three Ravens” is optimistic and romantic, the Scottish “Twa Corbies” pessimistic and dour).

Folk aspects of ballads include refrains; conventional diction, often borrowed from romance (red roan steed, lily white hand); “incremental repetition” of statements or questions (i.e., repetition with added information); and the leaping over of unimportant elements (motivation, description, etc.) but lingering on the action. Many ballads started out as long narratives but became compressed as they evolved orally. Sometimes (e.g., “Twa Corbies”) they end up close to pure lyric.

Ballads live with the folk and evolve with the singers. Those ballads that are still sung, that are alive in tradition, will treat subjects that are timeless, that appeal today. Stories of historical interest alone, which are culturally dated, like the Robin Hood songs, lose their interest and die in the oral tradition. They are no longer sung. Also the knowledge of printed versions has hindered the evolution of the songs because the singers are inhibited by what they feel is the authority of the printed word. But it is hard to define the essential quality of what appeals to the folk, which rejects much more than it accepts. The fittest, most adaptable examples of this evolutionary genre survived: certainly

no stories are more set in the past than those of the romance *King Horn* (ca. 1250) and the Breton lay *Sir Orfeo* (early 14th century). Yet the former lived half a millennium in oral tradition before it surfaced again in a printed text as “Hind Horn” (Child 17) in a fragment in 1810 and a full text in 1827. The ballad “King Orfeo” (Child 19) can be traced to the medieval story and an intervening Scottish fragment of the 16th century, *King Orphius*. It was first recorded from an oral informant in 1880. Both ballads are surely alive in tradition today. “Hind Horn” was last mentioned as sung in Nova Scotia around 1950, and “King Orfeo” in the Shetlands in 1947. Both areas are still today fertile ground for folksingers, and these two ballads have proved their ability to survive. In general, however, the medieval ballad remains embalmed in the printed words of anthologies.

Banks and Banking

In comparison with more advanced regions of the Continent banking functions in England were primitive, and organizations that can reasonably be termed banks enjoyed but a fleeting existence. By the 12th century facilities existed for

borrowing money at interest (usury), but the only practitioners were the Jews. They were expelled in 1290, though by then they had been partially superseded in this business by Italian merchants.

From an early date there must have been provision for manual exchange—the national exchange of coin in one currency for that in another. The story is obscure, but in England it may always have been, as it was later, a royal monopoly. The only other quasi-banking function was the safe-custody of treasure or valuables, sometimes deposited by the king or rich nobles in monasteries, particularly houses of the Templars. This was purely passive, the money being sealed up until called for.

The arrival of Italian merchants in the early 13th century slowly transformed the situation. The Italians were not financiers but traders, importing luxury goods and exporting cloth, wool, and tin. For most Italians trade remained the primary business, and even the few corporate societies that developed a fully fledged banking arm generally continued to trade. The first diversion was lending money to the crown, often as a favor, or even involuntarily, rather than as a strictly business proposition. The earliest loans were advanced in Rome to support the cost of English diplomacy there, but soon money was lent in England and elsewhere.

By the late 13th century, when the risk of prosecution for usury had been removed, it was safe to deal with nonroyal debtors. Many monasteries and nobles are then found to be indebted to Italian merchants, but it was still necessary to disguise payment of interest and it is seldom possible to calculate the rates charged. In this period deposit banking—where the client placed money with the banker—also appeared. Unlike the hoards that had previously been left in monasteries these deposits could be used by the bank as working capital, though the scale and precise details of the operations are a matter of dispute.

Some deposits may still have been made for reasons of security, but a person with a credit balance could draw upon it in the same way as one uses a modern checkbook account. Isabella de Forz used an account with the Riccardi to transfer money around the country for her own use; her agents in Yorkshire made payments of cash, while others took delivery in the south of England. Hugh Despenser the younger ordered his bankers to settle obligations to his creditors and instructed debtors to make payments into his account. Walter Langton, bishop of Lichfield, had interest-paying deposits with the Bellardi. There is no evidence that Despenser received interest on his accounts with the Bardi and Peruzzi, but neither did they charge him for their services.

Even more of an innovation than deposit banking, and in the long run far more significant, was the introduction of the business of international exchanges, that is, the transfer of funds from one country to another by letters

of obligation. This began in the early 13th century when the papacy commissioned merchants to receive money due in England and make payment in Rome. Later the crown, nobility, and merchants turned to the Italians for similar services. Attention has focused chiefly on the outward flow of funds, but it was not a one-way business. Before the end of the 13th century English wool merchants sometimes obtained letters of obligation to repatriate profits of overseas sales.

The great era of Italian banking was the reign of Edward I. Banks were already in retreat during the reign of his son, Edward II, and largely disappeared within a few years of Edward III's succession. Crown patronage was an important factor in inspiring general public confidence, which brought success to the banks; the withdrawal of patronage was a major cause of their eclipse. Henry III had borrowed haphazardly from any merchants able and willing to lend, but Edward I elevated the Riccardi of Lucca to the status of crown banker. He assigned to them great branches of royal revenue, most notably the wool export custom. In the certainty of a regular income the company routinely met royal orders for payments. In 1294 Edward went to war with France, and when the company was not able to meet his excessive demands he closed down its English branch—an act that contributed to its international failure.

In 1299 the Frescobaldi of Florence assumed the mantle of royal banker and continued until dismissed by the Lords Ordainers in 1311. From about 1313 the Bardi of Florence moved cautiously into the breach and remained there until brought down by Edward III, soon after the outbreak of the Hundred Years War, in much the same way as his grandfather had destroyed the Riccardi. This fiasco finally put an end to the involvement of banks in government finance. It also provided a further check to the general operation of banks in England, where they had already experienced a setback after a number of failures in the early 14th century. Banking functions did not cease, but there is no evidence of deposit banking after this.

The lending of money at interest continued, and the business of foreign exchange expanded despite intermittent hostility from parliament. Legislators claimed that letters of exchange were a cause of bullion loss and tried unsuccessfully to restrict their use. Most foreign exchange probably remained in Italian hands, since its most important prerequisite was a reliable correspondent on the Continent to honor letters drawn up in England. Italians continued to have better connections than other nationalities, and banking remained an un-English affair throughout the Middle Ages.

Baptismal Fonts

Baptismal fonts of stone or lead are a feature of English Romanesque art. While the Anglo-Saxons may have produced fonts of stone or wood, none has survived, although a number of Anglo-Saxon cross-shafts have been reused as fonts, the most famous example being the upside-down cross-shaft or base (dated ca. 1000) at Melbury Bubb. The Melbury Bubb font is carved with scenes from the bestiary (serpent and stag, lion breathing life into its cubs, hyena).

Fig. 20. Stone font, Eardisley Church, Herefordshire, ca. 1140. Lion. Courtesy of L. Hoey.

Fig. 21. Stone font, Eardisley Church, Herefordshire, ca. 1140. Harrowing of Hell. Courtesy of L. Hoey.

A dramatic increase in font production is evident in the third quarter of the 11th century, possibly coincident with the Norman program of church building (or rebuilding) in England. By the mid-12th century there is evidence for schools of sculptors and for production in centralized workshops. The ca. 1140 fonts at Castle Frome, Shobdon, and Eardisley in Herefordshire (figs. 20–21), Chaddesley Corbett in Worcestershire, and Stottesdon in Shropshire are associated with the work of Hereford School sculptors. The Castle Frome font is particularly fine. Its chalice-shaped bowl is carved with a combination Trinity and Baptism of Christ and symbols of the evangelists, all framed by bands of interlace at rim and stem. The base is formed of three crouching figures, possibly meant to be images of sin.

At some point in the 1160s a group of black Tournai “marble” fonts were imported into England, possibly by Henry of Blois. All seven surviving fonts have square bowls supported by a central column and four corner pillars. They appear to have been extremely popular and were soon imitated in cheaper native stone by a workshop in Norfolk (active 1160–80).

A third workshop was active in the Chiltern hills ca. 1170–90. Fonts of this school are characterized by their chalice shapes, fluted bowls, and scalloped bases carved with foliate ornament.

The last of the workshops devoted to font carving was active in the West Country (Devon and Cornwall) from ca. 1190 to ca. 1225. West Country fonts are characterized by cushion-shaped bowls supported by thick octagonal stems. The forms of the bowls are frequently decorated with single rosettes surrounded by a double-headed serpent, but the real trademark of the school is the motif of the human head (sometimes with angels’ wings) that protrudes from each of the four corners of the bowl.

Many other fonts were produced by smaller or less specialized workshops, resulting in a wide variety of decorative programs ranging from simple unadorned bowls to fonts decorated with scenes from the life of Christ. The font at Bridekirk (Cumbria) includes a portrait of the sculptor Richard with chisel and mallet at work on a bit of foliate ornament. Richard also added his name in runes.

Lead fonts also became popular in the 12th century. Thirty lead fonts survive in England, sixteen of 12th-century date. Produced primarily in the two lead-mining districts, Derbyshire and the Mendips, their distribution suggests that they were most popular with parish churches in the south of England. They were produced either by casting in sections, which were then welded together, or by casting a single sheet, the ends of which could be bent round and welded together to form a cylinder onto which a circular bottom was added. Decoration was impressed into the mold.

Due to their more limited area of production as well as to the ability of the

artists to reuse molds, the lead fonts are more unified in style and iconography than the stone corpus. They are decorated with three main types of decoration: foliate ornament, figures beneath arches, and alternating figures and acanthus scrolls in arcades. The latter type of decoration is characteristic of fonts produced in Gloucestershire ca. 1130–40. Four identical fonts decorated with twelve arcades containing seated figures alternating with acanthus scrolls survive at Frampton, Oxenhall, Siston, and Tidenham; two related fonts with fewer arcades also survive.

Fonts continued to be made in England to the end of the Middle Ages; never again, however, did they enjoy the prominence they achieved in the 12th century.

Barbour, John (ca. 1320–1395)

Scottish poet; appointed archdeacon of Aberdeen by 1357. Barbour’s verse chronicle *The Bruce* celebrates in over 13,000 lines of rhyming couplets the heroic deeds of Robert Bruce, king of the Scots from 1306 to 1329, and his follower James Douglas, including England’s defeat at the Battle of Bannockburn (1314). The poem was half-completed by 1375 and apparently finished by 1378; it stands as the only near-contemporary account from the Scottish viewpoint of the events it describes. Although Barbour uses clear, well-selected facts and considerable detail in his poem, as well as excellent descriptions of adventures and combats, the historical validity of *The Bruce* has been questioned, since Barbour exaggerates several episodes, particularly

inflating the number of foes Bruce faced. However, since *The Bruce* is fundamentally a patriotic epic designed to celebrate Scotland's struggle for freedom, the romantic elements—and the living picture of chivalry they provide—in fact blend well with the historical aspects of the work.

Written in the lowland Scots dialect of English, *The Bruce* survives in two manuscripts, Cambridge, St. Johns College 191 (G.23), and Edinburgh, National Library of Scotland Advocates 19.2.2.

Barnack

Only the elaborate tower survives of what must have been a notable Anglo-Saxon church of Northamptonshire, though six stones at the east end of the north aisle form part of a round arch antedating the present arcade cut through the wall; the Taylors considered that the thinness of the wall favored an Anglo-Saxon date. Rodwell suggested that a possible south porch of timber once covered the entrance of the tower (167). The name Barnack may designate “warrior oak,” possibly linked to a meeting or judgment place. Baldwin Brown claimed that the church was known for legal proceedings in this period.

The lower stage of the tower was a large chamber some 18 feet square internally and ca. 25 feet high, as the sills of all three windows in it are 20 feet up and the 13-foot-wide grand tower arch stands 20 feet high as well, with stripwork and notable imposts extending its size. Thus the first stage, now vaulted, occupies at least half of the total 52-foot height of the Anglo-Saxon parts of the tower, embellished internally with two openings, perhaps aumbries (recesses for sacred vessels), in the north and south walls, and a triangularheaded seat in the west wall. This seat may have been for a secular or religious person of importance, as in the legal proceedings mentioned, or it may have served a monastic context as the abbot's chair. Remains of wooden seats/benches for 40 were found on either side of the central seat in 1854–55, though their date is unknown. Arguably, then, Barnack may preserve a rare western sanctuary such as Canterbury had.

Fig. 22. Barnack, upper stage of west tower, west side. Courtesy of KM. Wickham-Crowley.

Externally the tower is covered with pilaster strips resting on corbels, dividing each side into four sections. The first stage has a south door with stripwork, upper windows on three sides, and a sundial with acanthuslike carving on the south. The south window has birds carved into the corners of the window-frame top, while the west window has a triangularheaded opening surmounted by a projecting beast's head reminiscent of Deerhurst's. Double rows of stripwork separate the two Anglo-Saxon stages. The upper stage is elaborate, with a door opening into the previously internal roof space on the east and the other three sides all having sculptured panels. The panels

rest on plinths above the stripwork and have vines and leaves surmounted by bird carvings (fig. 22). The south panel displays a bird on top that is probably a Victorian addition, since 19th-century illustrations show the slab broken. The panels have windows to either side, except on the west, where an upper doorway perhaps once opened to a gallery. Near the top of the second stage are central belfry openings or windows. Those on the north and south have beautifully carved *transennae* (stone screens) of curving geometrical design, while the east and west have less elaborate slabs carved with four long slots, two over two, perhaps forming a cross. The final piece of sculpture from the site, found beneath the floor of the north aisle in 1931, depicts a seated haloed Christ(?) in high relief, blessing with one hand while the other rests a book or tablet on his left knee. The figure, bearded and elaborately draped, has been dated variously as late Saxon or Anglo-Norman.

Baronial Reform (in the Reign of Henry III)

Despite the reforms that stemmed from Magna Carta relations between Henry III and his barons led to a series of political crises in the 1250s and 1260s. Questions surrounding royal executive power remained in dispute and were exacerbated when young Henry came of age.

Reform was mooted on numerous occasions between the king's assumption of personal power in 1234 and 1258, but to little effect. An armed demonstration by magnates at the parliament of April 1258 forced Henry to concede reform through a council of 24 men, twelve to be chosen by the king, twelve by the magnates. The king swore an oath to abide by their provisions, reported in the parliament at Oxford in June. Thus the reform program known as the Provisions of Oxford came into being.

Current reexamination of the 13th-century political scene argues that the movement of 1258 was born of a split within the ruling caste, the result of rivalry for influence with the king and for control of royal patronage. The prime target of what has been called a revolution within the court of Henry III was the influence of his Lusignan half-brothers and their supporters. Much of the reform was thus designed to control access to the king and to ensure that gains by the "reforming" party would not be short-lived. There was to be a council of fifteen in constant attendance upon the king; the power of the great officers of state was reaffirmed; and the office of justiciar (in effect chief judicial officer) resurrected; castles were to be placed in the hands of loyal and native castellans.

The program, however, proved to be broader than this. Wider support was essential to baronial success, so the problems and discontents of minor landowners and freehold tenants, in particular, were drawn on. Four knights were to be chosen in each county to attend the county court, hear complaints, and produce them before the justiciar when he appeared locally. Detailed reforms were contained in the Provisions of Westminster in October 1259. High on the list of items were the depredations of the sheriffs and other royal officials. Much discontent was also revealed with the behavior of baronial officials and with the rapacity of some of the magnates, particularly (though not exclusively) those of the defeated party of 1258. The reform had a further dimension; like Magna Carta (1215) the program was concerned not only to limit abuse but to sustain the essential framework of the Angevin legal and administrative system and to extend its benefits.

Despite the ultimate political failure of the reformers the activity of 1258–59 proved not to have been in vain. The attempt to control royal power died with Simon de Montfort at Evesham in 1265, but much of the detailed legislation of 1259 was reenacted in the Statute of Marlborough of 1267 and subsequently extended during Edward I's reign. Moreover the governmental procedures of enquiry, legislation, and law enforcement used so successfully by the reformers

in 1258–59 were taken up and became part of the normal process of Edward Is government.

Barton-on-Humber

Late-10th-century Barton-on-Humber is important to the history of Anglo-Saxon architectural study because of its exceptionally detailed modern excavation and study, and because Thomas Rickman used it in his pioneering 1817 book to establish, by relative chronology, those features distinctive from and preceding Norman work that have survived. He identified Anglo-Saxon remains by creating “principles of archaeological stratification in [standing] buildings” not applied to buried sites for another 50 years (Rodwell, 1990: 25).

Fig. 23. Cut-away isometric drawing of the Anglo-Saxon church at Barton-on-Humber. After W Rodwell, in Butler and Morris (1986). Courtesy of the Council for British Archaeology.

Located in Lincolnshire, now Humberside, the original church was late Anglo-Saxon. Evidence for previous domestic occupation on the site exists from Romano-British and pagan Anglo-Saxon times. Compact gravel floors were found dating to the 5th and 6th centuries, “clearly confined by what must have been timber-framed walls of rectilinear buildings” (Rodwell and Rodwell, 1982: 289). In the Middle Saxon period the ground was leveled and silt deposited over the site, while a large bank and ditch were constructed as an enclosure. No later than the 9th century a cemetery was built outside the enclosure, and the waterlogged soil has preserved a remarkable collection of

wooden coffins. Some were joined with iron clenches and roves, implying a clinker-built technique such as was used in boat building. Others were made without any metal, using pegs and dowels. The Anglo-Saxon church of the late 10th century had a central tower (fig. 23) that served as nave, a western chamber that served as a baptistery, and an eastern chancel, all plastered within and without.

When the church was made redundant in 1972, it fell into disrepair but offered an unprecedented opportunity under the Rodwells' direction for "total archaeology," that is, examination of everything from the roofs and standing walls down to underground levels, while also integrating a restoration program. The tower was originally of two stages, with the lower very tall and divided into two by stripwork arcades. Rounded arcading on the north and south supports from its arches the triangular-headed arcades above it. Two upper double windows with rounded heads open on the north and south and probably provided light to the lower nave level; this implies a gallery along the walls instead of a solid floor level, to let the light pass through. The second stage, set apart by a stringcourse, has no arcading and is only distinguished by its double triangular-headed belfry windows on all sides. The original roof was most likely a spire.

The western baptistery is a rare survival, less damaged for being outside the area of later rebuildings. It is irregular in plan, though that may be due to topographic influences, as many graves predating the church also have the same orientation. Two of the windows here are remarkable for retaining oaken mid-wall slabs with holes and slots to secure some covering, while evidence survives for the other windows having been built over basketwork shapes. The font base near the southwest corner survived to identify the room, resting on a soakaway (drainage pit filled with limestone chips) whose level proved that the baptistery was a primary feature. The Rodwells suggest that a cupboard stood in the southeast corner, though it might also be the frame for a stair or ladder, and a large posthole was centrally placed in the room.

The tower contained a gallery/ringing chamber with the belfry above and served as the nave with room for about 30 standing people on its lower level. It was entered by the main south door, with an additional door in the north and doorways to the eastern and western chambers. Doors in the church were once flanked by timber doorcases, possibly ornamental and anchored in postholes. The towers survival allowed the detailed plotting of fabric and disturbances in the fabric, yielding important information about construction methods and the role of carpentry in building. By plotting putlog holes (holes into which the ends of scaffolding timbers were inserted) and beams in the walls, Rodwell discovered how scaffolding was erected and masonry built up, determined the internal tower levels, and found the crane beam in the top tower stage that

would have been used to raise heavy materials. The chancel, though damaged because of later churches on the east, provided evidence for a screen or railing halfway across its length, to the west of which were two burials set to either side of the altar. Thus the altar backed onto the screen, leaving a smaller eastern chamber behind it that contained a single, central burial. Over the chancel arch survives a slab with an incised Anglo-Scandinavian head, probably once part of a painted Christ in Majesty.

Uncovered in the cemetery and presumed contemporary with the Anglo-Saxon building were several wells; an oven, possibly for the baking of liturgical bread (because of the lack of industrial slag or refuse), and a mortared rubble foundation half-excavated and presumed to be ca. 12 feet square (perhaps a cross base). The area has long been associated with Chad, granted 50 hides of land in ca. 669 for a monastery *Adbearw*, “At the Wood,” under Wulfhere of Mercia, and several sites preserve his name. Further study is needed to integrate historical evidence with the multiple sites known to survive before a link, if any, with Barton-on-Humber is known. Rodwell considers that it may have been a cell of Peterborough Abbey. Over 1,300 graves were excavated, providing extensive study of early carpentry techniques and of burials in the later Middle Ages associated with the various rebuildings of the church to the east of the surviving two chambers. Several of these burials on the southeast of the Saxon-Norman apse were sealed by liquid clay, indicating precautions taken against disease, and two later priests’ burials with chalice and paten were also discovered in the south porch of the Norman foundation. The church on the site continued to evolve after the mid-11th-century form, with three building phases in the 12th century, additional phases in each of the next three centuries, and a late Victorian addition at the east end. The two westernmost chambers of the Anglo-Saxon church survived as western annexes throughout all rebuildings.

Bastard Feudalism

A phrase first used by Charles Plummer in his 1885 edition of John Fortescue’s *The Governance of England*, to describe certain aspects of 15th-century English social bonds. Plummer’s essay was a jejune discussion of the ills of the 15th-century English state, labeled by K.B. McFarlane as an “overrated and misleading pamphlet.” Plummer’s phrase has been equally overrated and misleading. Until recently the term has usurped scholarly time and energy. It is *only* a term. Moreover its underlying Victorian morality is no longer a feature in historical scholarship; later medieval English society was no worse and no better than earlier. It was, however, more complex and therefore the bonding by which people sought to hold society together more sophisticated.

In the later Middle Ages the traditional ties of feudal tenure no longer sufficed (if they ever had). Around 1300 money replaced land as the principal means by which greater men got or hoped to get lesser men to do what they wanted. This was neither more nor less efficient. It was certainly not worse in the way Plummer thought—an undermining of social and moral order. Feudalism as a tenurial structure survived, but as an outer shell.

By the mid-14th century kings were paying their armies and lords were beginning to use rent charges or cash fees to retain knights and esquires to serve in peace and war. The sociopolitical method by which English society functioned at this elite level (until the 19th century) was in place by the 15th century. The more accurate, less pejorative, but clumsier term for it is patronage-clientage. There is an additional reason for this new formulation of

relationships by the second half of the 15th century (if not before); patrons and clients had no need of money to bind them together, nor of a document (the indenture of retainer) to formalize the bargain of mutual advantage. An understanding expressed in action was enough. The patron put his client in the way of the good things provided by his position in local and central affairs; the client saw to his patron's interests in those affairs.

Two exceptional and untypical retinues colored earlier thinking, those of John of Gaunt (d. 1399) and William, Lord Hastings (d. 1483). Both men were too close to the throne for too long for the number of their clients and the scale of reward to be seen as representative. The sphere of operations of all other noble and nonnoble patrons was more limited and local, the consequent gains of their clients more modest. Emphasis is now given in the scholarship to the pressure exerted on patrons by clients and the need of the former for the latter. If subjects were to be mighty they had to cultivate a following; the finesse with which they did so is what brought them success.

Battle of Brunanburh, The

In four of the seven texts of the Anglo-Saxon Chronicle the sole entry for the year 937 is a 73-line poem in the style of older Anglo-Saxon poetry, *The Battle of Brunanburh*. Against the chronicle background of prose entries, many of them concerned with terrible devastation wrought by the Viking invaders both before 937 and again later, *The Battle of Brunanburh* stands out as a brilliant panegyric for King Æthelstan (924–39) and his brother Edmund (939–46). It is important both as historical document and as poem.

Independent historical sources confirm the battle's importance in the struggle to secure all of England under one overlord. The battle—whose exact site is uncertain—ended when Constantine, leader of the Scots, and Anlaf (Olaf Guthfrithsson), leader of the Norsemen, retreated, leaving five enemy kings, seven earls, and countless other nobles including Constantine's son dead on the battlefield. When Edmund died nine years later, he had fully established control by the house of Wessex over England including the north, completing the work begun by his grandfather Alfred in the 9th century.

As a poem *The Battle of Brunanburh* has received mixed reviews and has often been compared unfavorably with *The Battle of Maldon*. However, the descriptions of close combat, of the misery of defeat, of the sun's cosmic passage over the scene, and of the beasts of battle as well as the contrast between the victorious English leaders, Æthelstan and Edmund, and the utterly devastated Constantine and Anlaf qualify the poem as a great example of Anglo-Saxon literature. The poem alternates between close views of the defeated and a panoramic sweep that accentuates the balance of the two winners against the two losers and at its conclusion sets the poem firmly in a historical continuum beginning with the 5th-century conquest of Wales and England by the Angles and Saxons.

The poem's descriptive passages exemplify such Anglo-Saxon poetic devices as variation, enumeration, and antithesis. For example, in lines 5 and 6 *heowan heapolinde*, "hewed the linden-shields," varies *bordweal clufan*, "cleft the wall of shields," reversing the word order but otherwise repeating the idea. Lines 10–12a, *Hettend crungun, / Sceotta leoda and scipflotan / fage feollan*, "The enemies perished, the people of the Scots and the sailors fell doomed," enumerate the two enemies. The description in lines 13b–17a of the sun's movement over the battlefield more elaborately employs variation of *sunne: mare tungol*, "glorious heavenly body," *Godes conde I beorht*, "God's bright candle," *sio apele gesceaft*, "that noble creation." The verb phrase *gladofer grundas*, "glided over the ground," balances *sunne* and *mare tungol*, subjects that precede it, against *Godes conde I beorht* and *sio apele gesceaft*, which follow. The poem's dignified and measured account of the sun's motion (*op sio apele gesceaft / sah to sette*, "until that noble creation sank to [its] setting place") enhances the sense of the battle's importance created by the larger

examples of antithesis. The metaphor *sio apele gesceaft* may also evoke a parallel between the sun and Edward's son Æthelstan, whose name means "noble stone."

The description in lines 60–65a of the beasts of battle (a traditional oral formula associating wolves and birds of prey with battlefields) employs variation and enumeration to emphasize the enjoyment of the carrion (*hraw bryttian*, 60) and contrasts sharply with the bookish final comparison of the battle to the earlier conquest of Britain. Variation emphasizes that the vanquished fled the battlefield with nothing to exult or laugh about (*hreman ne porfié*, 39, "had no need to exult"; *Gelpan neporfte*, 44, "had no need to boast"; and *hlehhan ne porfte*, 47, "had no need to laugh") and provides an antithesis to the simple statement in line 59 that the victors returned home *wiges hremge*, "exultant in war."

Though some critics disparage *The Battle of Brunanburh* as conventional triumphalism and merely imitative of earlier verse, in fact the poem stands out in the canon of Anglo-Saxon verse as the best of the chronicle poems and probably as the best panegyric. It does draw upon earlier Anglo-Saxon poetry, but it also draws on classical rhetoric and perhaps on the Norse genre of panegyric. The result is a noble gem of a poem that celebrates with dignity and poignancy a great moment in early English history.

Battle of Hastings

Fought on 14 October 1066 between Harold Godwinson, king of the English, and William, duke of the Normans, who claimed the English throne. Harold commanded a force of some 8,000 fighting men, the vast majority being local levies, that is, *fyrð* troops, called up largely from the area between London and Hastings during the period beginning about 3 October. They were instructed to muster about seven miles north-northwest of Hastings, at a place now called Battle. Perhaps 1,000 or so of Harold’s troops were highly trained professional fighting men, his housecarls, the personal armed followings of Harold, his brothers, and other important Anglo-Saxon magnates.

William’s army comprised about 10,000 men, of whom somewhere between 2,000 and 3,000 were heavily armed horsemen. Many of William’s troops were not Normans; a substantial group of mercenaries had been hired. Though he had a noteworthy contingent of archers, the Anglo-Saxons were seriously lacking in “fire power,” that is, the ability to inflict damage upon the enemy’s army at a distance.

Harold decisively defeated an invading Viking army around York, 190 miles from London, with great losses on both sides, only five days before learning of William’s landing. He ordered the mobilization of his southern levies and rushed south with the remains of his housecarls to blockade the invaders on the Hastings peninsula and then force them to surrender or withdraw across the Channel for want of supplies, as winter made resistance impossible. On the road south, or when he reached London, Harold ordered his fleet, which was being refitted after spending the summer in the Channel to prevent the Norman crossing, to proceed to Hastings to complete the blockade.

William could not permit himself to be blockaded, and he wanted to get Harold to engage as soon as possible. In order to encourage him in this

direction, and to avoid facing a fully mustered Anglo-Saxon army, William harried Sussex, where a substantial part of Harold's own estates was located.

Since Harold was not eager to engage William he took up an extremely strong defensive position on a ridge, some 2,600 feet in length, rising in spots to some 275 feet above the marshy plain. He deployed his fyrdmen in a deep phalanx with the housecarls in the front ranks to stiffen both the line and morale. William thus could have his battle, but first he would have to march his army at dawn some seven miles, establish a base below Harold, and then drive up the hill against showers of spears that would begin hitting their targets at 150 feet.

Having no choice but to fight or retreat, William had his archers loose volley after volley to "soften up" the Anglo-Saxon phalanx. Then he sent a combined force of foot and horse to attack the Anglo-Saxon lines; these held like a stone wall. A pattern of combined attacks to little or no effect was repeated into the afternoon, when William decided to try a feigned retreat with his Breton horsemen, experts in this tactic. It worked, and a portion of the right flank of the Anglo-Saxon line broke in hot pursuit of the "fleeing" Bretons. At a signal these horsemen wheeled their mounts and easily rode down the scattered foot soldiers, greatly outmatched on open ground. A second feigned retreat, now on William's right, had much the same effect. The Anglo-Saxon phalanx was much weakened as Harold's brothers and two ablest commanders were killed.

Toward dusk William's forces were gaining ground on the ridge in vigorous hand-to-hand combat when Harold was seriously wounded by an arrow, likely in the eye. With Harold's position in the center of the line overrun, the king hacked down, and the standard fallen, the Anglo-Saxon phalanx broke and a rout followed. Eudes of Boulogne and Duke William led a select force that rode down many of the fleeing enemy until exhaustion of the horses and darkness made further pursuit more dangerous than useful. Victory on the field opened the door for conquest of the kingdom.

Battle of Maldon, The

OE heroic poem, of which 325 lines survive. In the summer of 991 a large fleet of Vikings (probably led by Olaf Tryggvason, king of Norway from 995 to 999/1000, and perhaps also by Swein Forkbeard, king of Denmark from 987 to 1014) raided the southeast of England, sacked Ipswich, and sailed on into the estuary of the River Blackwater to threaten Maldon. There they were opposed by Byrhtnoth, ealdorman of Essex. In the battle that followed Byrhtnoth was killed. The Vikings were left with sufficient numbers to continue to pose a military threat, for, according to the Anglo-Saxon Chronicle, they were later bought off with 10,000 pounds of silver.

At the time of his death Byrhtnoth was a senior member of the Anglo-Saxon aristocracy. He had been appointed ealdorman in 956, and for the last eight years of his life he signed second only to Ealdorman Æthelwine of East Anglia in the witness lists to royal diplomas. The violent death of so prominent a man had great social and military repercussions, and it was probably these that led Sigeric, archbishop of Canterbury, to propose buying the Vikings off. The battle was reported in many sources besides the Chronicle. Three monastic calendars note the day of Byrhtnoth's death (10 or possibly 11 August); his heroic last stand is commented upon by Byrhtferth of Ramsey in the *Life of St. Oswald*, and the battle is mentioned by many Anglo-Norman historians in the 12th century. The *Liber Eliensis* (*Book of Ely*) reports that Byrhtnoth's widow, Ælflæd, gave the community at Ely, where Byrhtnoth is buried, an embroidery depicting her husband's deeds (presumably similar to the Bayeux Tapestry). In the *Liber Eliensis* there is also a more fanciful account of his dealings with the Vikings in the years leading up to his last battle. A related account, angled toward explaining why he was less generous in his will to Ramsey than he was to Ely, occurs in the Ramsey Chronicle. These stories and that on the "tapestry" are part of the legend that was wound about the memory of Byrhtnoth. It is in this context that we should view the OE heroic poem generally known as *The Battle of Maldon*.

The poem survived into the modern period in fragmentary form on three double sheets of parchment, probably used as binding leaves, which came into Sir Robert Cotton's hands at the beginning of the 17th century. He bound them into Otho A.xii, which suffered badly in the fire of 1731, when the Maldon leaves were totally lost. For our knowledge of the poem we are dependent

upon an early-18th-century transcript, made probably by David Casley and now found in Bodl. Rawlinson B.203. The poem lacks both a beginning and an end, and there is now no means of dating the hand of the only surviving copy or of learning anything of the manner of its survival. Its language is for the most part uniformly late West Saxon, except that one or two spellings and some Scandinavian borrowings point to an eastern origin. It cannot be dated, but an attempt to place its composition in the reign of Cnut (1016–35), on the grounds that the term used of Byrhtnoth, *eorl*, is an anachronism, has not found general favor; rather, the tone of the piece suggests that it was intended for an audience familiar with those who died in the battle.

In the poem the story is told entirely from the English point of view. The fragment begins with Byrhtnoth deploying his troops alongside the river, across which the Vikings are evidently camped, presumably on an island. Tribute is demanded by the invaders and scornfully refused. The Vikings can attack only across a narrow causeway that is covered at high tide, and this creates a pregnant pause before the fighting starts. As the tide recedes, it becomes clear that Byrhtnoth can control the action by defending the ford, so the Vikings treacherously ask to be allowed freedom to cross and Byrhtnoth gives what the poet calls “too much land.” The English form up behind a “shield wall” and battle begins. Byrhtnoth himself is engaged by one of the Vikings, whom he expertly kills, but at the moment of his triumph he suffers a severe wound, and though his squire bravely intervenes to destroy his attacker the odds are too great and Byrhtnoth falls. Some of his closest companions flee, one of them on Byrhtnoth’s own horse; assuming that it is Byrhtnoth who is deserting, the company at large breaks ranks. But many remain in a doomed but noble attempt to avenge their commander, and the fragment ends with them exhorting one another to deeds of valor.

The poet adopts the heroic style of earlier OE verse. He portrays Byrhtnoth and his companions as a Germanic warlord with his *comitatus* (the traditional aristocratic warrior band), emphasizing that the battle was lost because not all the “hearth companions” maintained the loyalty owed to such a “treasure giver.” At the same time the poet shows that the *comitatus* is merely a vehicle for his theme of loyalty by stressing the social, geographic, and age range of the men who died valiantly beside their leader, naming individuals from many parts of Essex but also from Mercia and Northumbria, peasant farmers alongside aristocracy, young men and old. He is not afraid to criticize his hero, condemning Byrhtnoth for allowing the Vikings across the ford but overall depicting him as an outstanding leader, a good tactician, careful of his troops, personally valiant, authoritative, generous and God-fearing. Those who die with him are characterized concisely and with skill; syntactic and verbal repetition emphasizes their common resolve. Although there are relatively few

flights of fancy in its imagery, the poem is exceptionally well structured, and the selection of appropriate diction and the successful control of meter in the telling of a powerful moral tale make it one of the most dramatic and memorable short poems in the OE canon.

Battles of Bannockburn and Boroughbridge

The Battle of Bannockburn, fought near Stirling Castle in Scotland on 23–24 June 1314, and the Battle of Boroughbridge, fought in Yorkshire on 16 March 1322, marked turning points in the troubled reign of Edward II.

When Edward I died, the English attempt to conquer Scotland, which had been in progress since 1296, was failing. In 1306 Robert Bruce's seizure of the Scottish throne provided the Scots with energetic leadership. The English-held castles in Scotland were taken, one by one, until in 1313 Stirling Castle, strategically placed in the Lowlands, was besieged. Its constable agreed to surrender if the castle were not relieved by Midsummers Day the following year (24 June 1314).

The challenge was taken up eagerly by Edward II, since it offered the chance of defeating the Scots in a pitched battle. Although several of his earls refused to serve, Edward II gathered an army of about 15,000 infantry (archers and spearmen) and 2,000–3,000 cavalry, with many experienced commanders. The Scottish army, which may have numbered about 7,000–10,000, included few heavy cavalry but a large number of infantrymen armed with long spears and trained to fight in circular formations ("schiltroms"). The impetuous English attack was broken up by the Scottish spearmen with heavy casualties; the English archers, who had helped win earlier battles against the Scots, never came into action, and the result was a crushing Scottish victory. Many leading English nobles were killed or captured, and Edward II had to flee for safety. Although England did not finally recognize Scottish independence until 1328, the Battle of Bannockburn humiliated England and ensured that Scotland could not be defeated. The battle also showed that cavalry forces, which had for centuries ruled the battlefields of Europe, were vulnerable to well-trained infantry prepared to stand their ground.

The Battle of Boroughbridge ended the civil war that had broken out in England in March 1321, when a group of prominent lords from the Welsh borders (the Marchers) attacked the lands of the Despencers, current royal favorites. Edward, acting with unaccustomed energy and decision, recalled the Despencers from exile, gathered an army, and early in 1322 advanced against the Marchers. Having forced the surrender or flight of most of his opponents, Edward then turned against his old enemy (and cousin), Thomas earl of Lancaster. While attempting to flee to Northumberland, Lancaster was brought to battle at Boroughbridge in Yorkshire by another royal army, advancing from the north of England and consisting mainly of "hobelers," lightly equipped cavalry used in the wars with Scotland. Lancaster was captured and executed outside his own castle of Pontefract. Though this was a major victory for

Edward II, his vengeance and subsequent policies proved to be the beginning of his own downfall five years later.

Battles of Lewes and Evesham

The baronial reform movement of 1258 had resulted in the expulsion of Henry III's Lusignan half-brothers and the containing of the king. Not surprisingly the situation remained volatile, with a royalist reaction in 1261–62 and a subsequent regrouping of many of the reformers in 1263, now clearly led by the charismatic and intransigent Simon de Montfort, earl of Leicester. His decision to seek the arbitration of Louis IX of France was a major political blunder, for Louis simply gave his verdict (the Mise of Amiens, January 1264) in favor of untrammelled kingship and Henry III. The result was civil war. When the armies finally engaged, at Lewes on 14 May 1264, it was the boldness and strategy of Montfort that won the day against numerically superior forces. After ferocious fighting the king and his son Edward were in Simon's power; the Provisions of Oxford, the political platform of the earl's party, could at last be reaffirmed.

These momentous events were celebrated in verse, in the elegant *Song of Lewes*, as well as in such minor pieces as the mocking *Song against the Barons' Enemies*. However, the reformers were now in considerable difficulties, having fought against their king. The prospect of an indefinite perpetuation of Simon's power worsened the situation. The calling of burgesses from the towns as well

as representatives from the counties to a parliament in January 1265 is symptomatic of the need to widen the basis of support.

With the barons from the borders in active opposition the defection of the earl of Gloucester from de Montfort's cause and Prince Edward's escape from custody were severe blows. With a second military confrontation pending Simon was effectively hemmed in west of the Severn. It was now Edward who was to prove the bold strategist. His surprise attack on the army of Simon the Younger, camped outside Kenilworth (rather than secure within the castle), effectively minimized the chances of a linkup between the two Montfortian forces upon which the old earl's success largely depended.

At Evesham, still hoping for the arrival of his son, Simon faced overwhelming odds on 4 August 1265. The result was what the Chronicle of Robert of Gloucester called "the murder of Evesham." There is a literal truth in this. After a short time of fighting Simon lay dead and his close supporters killed or captured. There followed a considerable slaughter of the fleeing footsoldiers, a feature reminiscent of Prince Edward's bloodlust against the Londoners at the Battle of Lewes. Given the military circumstances of the day there was no need for the defeated earl to die. His death was a political act. The wholesale seizure and confiscation of rebel lands considerably delayed the subsequent pacification of the realm.

The Battle of Evesham had been decisive. Although the events of the years 1258–65 were to have a profound impact upon the future government of England, the directive role of the monarchy had been secured. Meanwhile Simon de Montfort's heroic stand could not fail to have an impact upon contemporaries, just as it has captured the imagination of antiquarians and historians ever since.

Bayeux Tapestry

The Bayeux Tapestry, made within the lifetime of men who fought in the Battle of Hastings, is a principal document relating to the Norman Conquest of England in 1066. In a series of pictures captioned in Latin the unknown artist recounts the rivalry of Harold Godwinson, earl of Wessex, and William, duke of Normandy, for the throne of England. The upper and lower borders of the Tapestry are filled with figures of birds and beasts, scenes from fables, and other matter. During the winter of 1982–83 the Tapestry was taken from its showcase in the former Bishop's Palace at Bayeux, photographed front and back, subjected to technical analysis, gently vacuum-cleaned, and rehung in its present quarters, the Centre Guillaume le Conquérant, near the Cathedral of Bayeux, Normandy, where it attracts ever-growing numbers of visitors.

Though called a tapestry, the work is in fact an embroidery done in colored woolen threads on a ribbon of linen about 230 feet long and 20 inches wide. It is the only large-scale example of needlework surviving from the Middle Ages. Buildings and trees help frame individual episodes, which include striking scenes of banqueting, ships at sea, fighting at Hastings ([fig. 13](#): see ARMS AND ARMOR), royal and ducal palaces, churches, and incidents of daily life. Some 1,500 figures of men and women, horses, miscellaneous birds and beasts, ships, and buildings appear in the work. Scenes from Aesop's fables and other imagery scattered throughout the borders suggest themes appropriate to the action in the main panels. The consistency of the design throughout strongly suggests a single designer. Though hard evidence is lacking, it is generally held that, given contemporary social conditions, the anonymous designer was almost certainly a man and the needleworkers probably both men and women.

The story in the Tapestry begins as Edward the Confessor, the reigning English monarch, sends Harold on an unspecified mission across the English Channel. The crossing ends with Harold's capture by Guy of Ponthieu. William of Normandy rescues Harold and takes him to Rouen, from which place the two men leave on a campaign in Brittany. At the successful conclusion of the campaign William rewards Harold with a suit of armor, and Harold promises that William is to succeed King Edward, who has no immediate heir, on the English throne ([fig. 24](#)). Edward dies, and Harold, breaking his oath, takes the English throne. In response William builds a fleet, crosses to England, and defeats Harold in the Battle of Hastings. Harold dies in

the battle.

In part because of the Tapestry's popular appeal and because of the scarcity of surviving evidence the literature interpreting it is strikingly uneven, ranging from solid scholarship to legend and conjecture. One finds sheer guesses as to the identities of persons, birds, beasts, and actions shown in the work. Careful research like that of Helen Chefneaux's identification of eight of Aesop's fables in the borders has been followed by later attempts to expand the number of fables to as many as 40, largely on the basis of conjecture. Such efforts serve to emphasize the continuing need for well-documented, cautiously applied research.

During the 1980s scholarly consensus began to coalesce around the major issues of date, locale, and patronage. The years from the late 1060s to the mid-1090s are now widely taken to bracket the probable period during which the Tapestry was made. Broad consensus has also developed on one or more English locations, including St. Augustine's Abbey, Canterbury, as the place or places where the embroidery was done. Odo, half-brother of the Conqueror, is now widely believed to have been the patron of the work.

Fig. 24. Bayeux Tapestry. Harold swears an oath before William. Reproduced by special permission of the City of Bayeux.

Discussions of the Tapestry's support of an English or a Norman point of view of the Conquest began in the late 1970s to give increasing emphasis to English elements both of design and of purpose. Debate on this issue continues. Several writers have suggested that a number of puzzling elements in the Tapestry may be attributable to English embroiderers secretly working Saxon views into its story. Bernstein gives an extended exposition of the

concept of the Tapestry's hidden messages. Discussions of this topic commonly omit the possibility that there may have been, following the Conquest, various Norman as well as various Saxon views of the event—the possibility, for example, that William the Conqueror's views may have differed from those of the patron of the Tapestry, Odo, with whom the Conqueror is known to have had violent disagreements.

Behind a number of attempts to reconcile the Tapestry's account of events with accounts in various early chronicles there lies a fundamental issue: whether the Tapestry is best understood as primarily a chronicle of accurate historical information or as a work of art shaped by its own artistic needs and aims. Widespread agreement on this issue is not in sight. In any case the Tapestry cannot be taken as simply the illustrated version of any known chronicle. Vigorous efforts to bring the Tapestry's imagery into conformity with this or that written record have led to continuing debate over exactly what it is that the Tapestry itself shows.

Among many recent studies of the Tapestry two in particular are notably helpful: David Wilson's *The Bayeux Tapestry: The Complete Tapestry in Colour* (1985) and Shirley Ann Brown's *The Bayeux Tapestry: History and Bibliography* (1988). The scale of reproduction in Wilson's book is more than half the original size (approximately 54 percent).

Brown annotates virtually every study done on the Tapestry in the past two and a half centuries. The core of her book is an annotated bibliography of more than 500 books, articles, and other material bearing on the Tapestry. For each item she gives a full bibliographical reference, a summary of content, and a list of the principal topics touched upon. Valuable appendices list ancillary material: documents, literary sources, and background readings. She gives what is probably the most complete history of the Tapestry.

Beast Epic and Fable

Two related yet distinct genres of European writing represented in ME. William Caxton translated and printed two books of animal stories: *The History of Reynard the Fox* (1481) and his *Aesop* (1484), taken respectively from Dutch and French. These books represent the two most important branches of animal story in medieval Europe, the Aesopic fables and the Reynardian material (also known as beast epic). The primary difference between the Aesopic collections and the Reynardian tales is a binary structure in the Aesopic material, of fable followed by morality (*moralitas*), as distinct from the continuous narrative of the beast epic. The Aesopic material also contains stories of many animals, whereas the beast epic focuses especially on the fox Reynard (sometimes on the wolf Ysengrim), and his cynical, amoral dealings in and around the court of the lion.

The Aesopic conventions are much older than the Reynardian material. The Latin collection of Phaedrus (1st century A.D.), a translation of a Greek "Aesop," represents the chief source of later fable collections, although the collection of Avianus (ca. 400?) was also a medieval school text. Phaedrus was paraphrased in a collection known as "Romulus" (ca. 350–500?), which was versified in the 12th century. This collection is behind many of the vernacular Aesops of the later Middle Ages. The Reynardian material derives ultimately from Aesop (one of its central stories, the tale of the sick lion, in which the fox tricks the wolf, appears in Aesop), but the continuous narrative characteristic of the Reynard material begins with the *Ecbasis Captivi* (mid-11th century) and is greatly developed in the *Ysengrimus* (1148–49), an important source for the

earliest branches of the *Roman de Renart*.

In ME and Scots these traditions are surprisingly little represented, but what representation they do have occurs at a high level of sophistication in both Chaucer and Henryson. The beast-epic tradition first appears in a short 13th-century story, *The Fox and the Wolf*; then in an early-14th-century political poem (where the fox and wolf represent those who bribe justice); and in Chaucer's *Nuns Priests* (1396–1400), which also introduces fabular elements. The Scottish poet Henryson incorporates Reynardian material into his *Fables* (1460–80), and in the same period Caxton produces his translation, mentioned above. Aesopic material is found in Lydgate's *Isopes Fabules* (ca. 1400), Henryson's *Fables*, and Caxton. These animal stories should be distinguished from other works in which animals speak and act, like *The Owl and the Nightingale*, which draw on animal fable to some extent but owe their deepest debts to traditions of debate poetry.

The interpretive assumptions of animal fables are usually fairly simple: an uncomplicated story in abbreviated narrative style is followed by a straightforward moral or allegorical meaning. It was for this reason that fables were used as school texts. In the hands of artists like Chaucer and Henryson, however, this simplistic form becomes the occasion for the sophisticated mixing of rhetorical style and for an acute awareness of the interpretive problems raised even by simple stories. Henryson also extends the normally proverbial, “worldly wise” wisdom of fables to include more systematic philosophical perspectives, and his *Fables* must be rated as one of the finest fable collections in European literature.

Beauchamp Family

From 1066, when Urse d’Abetôt fought at Hastings for William, to 1268, when William de Beauchamp became earl of Warwick, the Beauchamps were the dominant local power in Worcestershire. Later members of the family took a prominent part in the affairs of the kingdom. By the early 15th century the family had become one of the wealthiest in England.

When William de Beauchamp succeeded his maternal uncle William Malduit as earl of Warwick in 1268, he emphasized his descent from the legendary ancestor Guy of Warwick. Already a romance about Guy had become one of the most widely known of ancestral romances. William named his son Guy, and a tower added to Warwick Castle was called Guy’s Tower. The badge of the earls combined the bear associated with their ancestor Urse and the ragged staff, the weapon of Guy. Earl Guy fought in Edward I’s campaigns in Scotland, was one of the Ordainers in 1310, and was responsible in 1312 for the capture and execution of Piers Gaveston, Edward I’s notorious favorite. The next earl, Thomas, was with the Black Prince at the battles of Crécy in 1346 and Poitiers in 1356. His son Thomas was appointed governor of young Richard II by the Good Parliament in 1377, became one of the Lords Appellant against Richard’s arbitrary rule, and was later imprisoned by the king in the Tower of London (in what became known as the Beauchamp

Tower).

Richard Beauchamp (1381–1439) was the most famous member of the family. Noted for feats of arms from his youth, he captured the banner of the Welsh rebel Owen Glendower in battle and later commanded half of Henry V's army in France. He held Joan of Arc prisoner during the trial that led to her execution. At his own death Richard was buried in a splendid chapel in the church at Warwick with a tomb and gilded effigy that remains one of the glories of late-medieval art.

Beaufort, Margaret (1443–1509)

Countess of Richmond and Derby; translator, literary patron, and educational benefactor. Daughter of John Beaufort and great-granddaughter of John of Gaunt, she married successively Edmund Tudor, Henry Stafford, and Thomas, Lord Stanley; in 1485 her son Henry Tudor became King Henry VII. She was famous for her learning and piety, manifested in her endowments of Oxford and Cambridge chairs of divinity and her role in the founding of Christ's College and St. John's College, Cambridge.

Lady Margaret owned books in English, French, and Latin and instigated the compilation or publication of a range of works, including ordinances for royal ceremonies; Caxton's translation of *Blanchardin and Eglantine* and his prayer

collection known as *The Fifteen O's* liturgies printed by Haghe, de Worde, and Pynson; and de Worde's editions of Hilton's *Scale of Perfection*, Watson's translation of Sebastian Brandt's *Ship of Fools*, Hatfield's translation of *The Life of St. Ursula*, and a treatise and sermon by her friend Bishop Fisher. Her own surviving translations, both first printed by Pynson, were from French versions of orthodox devotional works: a contribution to William Atkinson's rendering of *The Imitation of Christ* (1504) and *The Mirror of Gold for the Sinful Soul* (ca. 1506), attributed in its original Latin to the Carthusian monk James of Gruyetroede, prior of the Charterhouse of Liège.

Beaufort Family

The surname of the four children of John of Gaunt, duke of Lancaster, by his mistress, Katherine Swynford. They were legitimated when their parents eventually married in 1396; they and their descendants were to play an outstanding part in 15th-century politics ([fig. 25](#)). Early favors came from Richard II, but it was the accession of their half-brother, Henry IV, that brought them to prominence. Two of the brothers held earldoms, as well as high offices, while their sister, Joan, the second wife of Ralph earl of Westmorland, became through her numerous progeny the grandmother of the Yorkist kings, of Warwick the Kingmaker, and of many of the greater nobles of the time.

The outstanding member of the family was Gaunt's second son, Henry, bishop first of Lincoln and then of the wealthy see of Winchester and eventually cardinal. A man of ability and enormous wealth, he played a dominant if controversial part in English government during the minority of

his great-nephew Henry VI and achieved great influence over the young king. He married his niece Joan to King James I of Scotland, and later his wealth and power assisted the careers of his nephews John and Edmund, successive dukes of Somerset (and sons of John earl and marquess of Somerset), who were active if not very successful in the French wars.

After the cardinal's death, however, the role of the Beau-forts changed, as discontent grew with the rule of Henry VI and the dynastic question raised its head. In 1455 Edmund, after several years as Henry's chief minister, punctuated only by the period of Henry's insanity, was slain by York and his Neville allies at the Battle of St. Albans. His sons were to prove over the next fifteen years the most loyal and active of the Lancastrian nobility until the death of the last legitimate Beauforts at the Battle of Tewkesbury in 1471. Duke John's daughter Margaret was left as the heir of the senior line, and it was through her that her son, Henry Tudor, claimed the royal descent that allowed him to secure the throne as Henry VII in 1485. Margaret lived on into the next century, wielding much influence during her son's reign.

Beaufort Family Genealogy

Fig. 25. Partial Beaufort family genealogy.

Becket, Thomas (1120–1170)

England's best-known saint and martyr. Archbishop Thomas was murdered in Canterbury Cathedral on 29 December 1170 by four household knights of Henry II. He subsequently became one of the greatest medieval cult figures and Canterbury one of Europe's greatest pilgrimage centers.

Thomas, son of a respectable, moderately wealthy London merchant, was educated in an Augustinian priory, a London grammar school, and Paris in its preuniversity days. From 1143 to 1145 he was apprenticed to a London banker, enjoying a wild, frivolous life; he supported the Angevin side in the civil war of Stephen's reign. Thereafter he joined the household of Archbishop Theobald of Canterbury, where his companions included John of Salisbury, Gilbert Foliot, Roger of Pont l'Évêque, John of Pagham, and John of Canterbury—scholars and future bishops who together suggested a protouniversity. He learned superb administrative skills, derived from Theobald's training at the hands of his own predecessors, Lanfranc and Anselm. Theobald supported the

Angevins against Stephen and went into exile; Thomas accompanied him to Rome, learning international diplomacy. As papal legate after 1150 Theobald arranged Henry of Anjou's succession as Henry II.

When Henry acceded in 1154 at age 22, his English backers, seeking to control, counsel, and educate him, chose Thomas as the chancellor (1155–62). Becket became almost Henry's alter ego and best friend, raising the office of chancellor to new heights of power and responsibility. His magnificent lifestyle—the grandeur and ostentation befitting the king's constant companion in hunting, gaming, feasting, and joking—would haunt him later. But he counseled Henry to rule justly for the welfare of kingdom and church, and Henry obeyed. Theobald is said to have designated Thomas as his successor.

Henry chose Thomas for Canterbury, primate of the English church, on Theobald's death (1162). Immediately Thomas underwent a surprising transformation; from model courtier he became model archbishop. His lavish extravagance became lavish charity, his household of courtiers became one of scholars and learned lawyers. Days of hunting and feasting became days of study, devotion, and prayer. Scholars still cannot explain this metamorphosis.

Becket, now a fanatic reformer, clashed with Henry over royal and ecclesiastical rights. Thomas claimed his duty was to rule the church according to "law and right"—by which he may have meant the canon law just then being systematized by the papal court. Henry insisted on his duty to preserve England's "ancestral customs"—later the "precedents" of English common law—as crystallized in the Constitutions of Clarendon (1163). Thomas protested violently, fleeing into exile (1164). During the next six years both men sent secret missions to Pope Alexander III, the French king, the German emperor, and counts, abbots, bishops, and archbishops throughout Europe to gain allies. Reams of propagandistic letters flew from court to court, replete with deceptions, half-truths, and manipulations of public and private opinion. Neither man displayed statesmanlike talents in this contest, both remaining volatile and inflexible on minor points. Thus repeated attempts to compromise failed over obscure and sometimes silly demands.

While Henry grudgingly yielded on specific issues—at last virtually acceding to Thomas's demands—he underhandedly resurrected Becket's worldly reputation as chancellor and torpedoed one settlement by refusing the Kiss of Peace. While Thomas was admired for his immovable, righteous stance, he so offended nearly everyone that he was hated almost universally in his victory. When compromise came (at Freteval, 1170), Thomas ruined it, returning to England and promptly excommunicating all Henry's supporters—including most of the bishops. This further enraged the four already-enfuriated knights who took Henry's exasperated statement that none of his household were helping him against Thomas as a signal for murder.

Becket's supporters declared him a martyr. But no modern historian has yet explained satisfactorily his motivations and actions. He claimed, following his predecessor Anselm, to fight for God and Right. Indeed he succeeded in forcing Henry to submit to papal formulations of canon law and partial papal control, yet only at the near-destruction of the English church, of which Thomas was shepherd and guardian. Thus Thomas still remains a mystery, a mass of contradictions and controversies—as his companions suggested, a “sacred monster.”

Bede the Venerable (ca. 673–735)

Honored as “the Venerable” even in his own day, Bede (Baeda, Beda in earliest sources) was the foremost educator, exegete, and historian of his epoch, the Northumbrian Golden Age. Of his life Bede himself provides nearly all we know, in the short autobiographical note he appended to the last chapter of his *Ecclesiastical History of the English People*, with a list of his numerous writings. He occasionally gives a personal detail in one of his other works. Bede was born on land that a year or two later (674) was given by King Oswiu (Oswy) to Benedict Biscop to build the very monastery Bede would enter at

age seven, St. Peter's, Wearmouth. In 681, two years after Bede's initiation into the community, Benedict established at nearby Jarrow the twin foundation of St. Paul's, formed as an integral part of a single monastery with St. Peter's. At some point Bede was transferred to this new foundation under the strict and learned Ceolfrith, whose place was later filled by Hwætberht. With the exception of a few short trips to Lindisfarne and York Bede spent his entire life as a monk-scholar at St. Paul's.

Ordained a deacon at the age of nineteen (six years before the usual canonical age), Bede then proceeded to the priesthood at age 30 (703). He became the "beloved father and master," as his disciple Cuthbert called him, of the thriving intellectual and spiritual center of learning. Bede taught the basic disciplines of grammar and computus: grammar, the science of the Latin language and its interpretation; computus, the science of determining time, especially the ensemble of rules by which the date of Easter is reckoned. Since the master in many early monasteries was also responsible for teaching psalmody, Bede also may have taught chant.

Bede wrote several educational treatises to complement the texts available from late antiquity. He wrote "a book on the art of meter," the *De arte metrica*, a systematic exposition of Latin versification by means of a judicious compilation of late-antique commentaries on the grammarian Donatus, demonstrated by examples from Virgil and Christian poets. The book makes evident Bede's qualities as a textbook writer: apt selection, concentration on essentials, simplicity, and precision. His own contribution to metrical history is his description in chapter 24 of isosyllabic stress rhythm, accentual meter, which eventually superseded quantitative Latin verse in medieval poetry. Bede appended to this work his *De schematibus et tropis*, "a small book on figures of speech or tropes, that is, concerning the figures and modes of speech with which the holy scriptures are adorned." Bede adds considerably to Donatus's section on the trope of allegory, with a section on symbol in deeds and in words. Bede's *De orthographia*, "a book about orthography," consists of short alphabetized entries about the meaning and correct usage or spelling of words likely to cause difficulties for a medieval Latinist.

For the basic curriculum Bede composed another little educational piece, *De natura rerum*, "a separate book on the nature of things," serving as an introduction to cosmology in 51 chapters on the earth, the heavens, stars, and planets. The text, a reworking and betterment of Isidore's *Liber rotarum* and Pseudo-Isidore's *De ordine creaturarum*, incorporates much from Pliny's *Natural History*. Near the beginning and near the end of his distinguished writing career Bede composed works on time and its calculation. The first, *De temporibus*, a radical revision of material in Isidore's *Etymologies* and Irish supplements, consists of 22 brief chapters on measurement of time, the six ages

of the world, and a short chronicle of the most important events in salvation history. His recalculation of the time spans of each age according to Jerome's translation of the Hebrew Bible instead of Jerome's earlier figures from Eusebius led to a charge of heresy being leveled against Bede in Bishop Wilfrid's court at Hexham, on the grounds that he placed Christ in the fifth instead of the sixth age—a charge he vigorously denied in a formal and ferocious letter to Plegwin, a monk of Hexham.

Bede's students found the first book on time to be too dense for easy learning, so Bede remedied this by producing a new, expanded version, *De temporum ratione*. After initial chapters on finger calculation, Greek and Roman letters symbolizing numbers, various aspects of time and historical modes of measurement he proceeds, as he did in the *De temporibus* but in much greater detail, from the smallest to the largest units of time. He includes a chapter on English months, with precious information for students of Germanic and Anglo-Saxon culture. He concludes the work with an extended discussion of the ages of the world.

Bede considered all his educational treatises, grammatical and scientific, as preparatory instruction for the study of scripture. Although Bede is known today mainly as an historian, in his own time and throughout the Middle Ages he was known primarily as an exegete. The books of the Bible he chose to interpret are of two kinds: those that were already favorites of the Fathers, such as the commentaries on Genesis and on Luke, and those that were largely ignored by earlier exegetes, such as the commentaries on Ezra and Nehemiah and on the New Testament Catholic Epistles. Both filled pedagogical needs: the former, selected and simplified for his English pupils, display Bede's talents as an adapter and synthesizer; and the latter, supplementing the Fathers, demonstrate his originality within the exegetical tradition.

Bede's usual method of commentary is the early-medieval one of phrase-by-phrase exegesis of a biblical text, from beginning to end; it is a process of rumination, fostered in the monastic tradition. Bede relies heavily on Augustine for doctrine and much of his exposition, but in interpretive spirit he favors Gregory the Great, with whom he shares a kind of spiritual affinity. Like Gregory and many of the Fathers he interprets the Bible both literally (according to the basic, obvious, surface meaning) and allegorically (according to the deeper, hidden, spiritual, symbolic meaning). Bede's exegetical practice is eclectic and literary. If appropriate, he will point out the typology (an Old Testament event as prefiguration of the New). Often he presents a twofold relationship in a text, with a single allegorical interpretation superimposed upon the literal meaning. At other times he spreads out a threefold meaning, either historical, allegorical, and moral (applying to one's own life) or historical, allegorical, and anagogic (applying to the final Judgment), or he

follows the fourfold method of historical, allegorical, tropological (moral), and anagogic interpretations. Though he derived this schema from Cassian, Bede became the definitive authority in the Middle Ages for it. In addition to his biblical commentaries he compiled two biblical aids, a compendium on the places of the Holy Land, derived primarily from the itinerarium of Adomnán, and a gazetteer explaining and locating places mentioned in the Bible.

For Bede preaching was a priest's primary function and had a special, even sacramental, significance: preachers are the successors of the prophets and apostles. For the liturgical year he composed two books of 25 homilies each. In hagiography Bede revised the lives of various saints, including Felix, Athanasius, and Cuthbert; he also composed an historical martyrology, 114 brief accounts of martyrs' lives and deaths, which played an important role in the development of the Roman martyrology. Although Bede wrote "a book of hymns in various meters and rhythms" and "a book of epigrams in heroic and elegiac meter," we now possess only a few of each, about two dozen poems in all. These include a poetic tour de force in honor of St. Æthelthryth, the famous *Hymnos canamus glorie*, and the even more famous *De die iudicii*, on Judgment Day. Although well versed in OE poetry, he may not have composed the five-line OE poem called "Bede's Death Song," which he recited on his deathbed.

Bede's fame today derives mainly from his work as an historian. His histories not only provide us with information now known only because of him; as products of his mature scholarship and long writing career they also mark momentous advances in the science of historiography. His *History of the Abbots of Wearmouth and Jarrow* first describes the life and career of the great founder of the monastery, Benedict Biscop, then incorporates and edits the anonymous life of Abbot Ceolfrith, fused with descriptions of the abbots Eostorwine and Sigefrith, and ending with Bede's coeval Hwætberht. Although he attributes no miracles to any of the five remarkable abbots, he represents them in this monastic chronicle as splendid characters. Unlike the two world chronicles he appended to his treatises on time his *Ecclesiastical History of the English People* is history in the grand and full scale, which has gained Bede the well-deserved title of "father of English history."

The first Englishman to write history with a full sense of historical responsibility and with control by his use, arrangement, and omission of materials, Bede was also the first to relate the history of England. He is the first literary authority for a structured history stretching from Roman Britain, the invasions of the Angles, Saxons, and Jutes, some events in Scotland and Ireland, to the mission of Augustine to Kent, Paulinus to Northumbria, the doings of Theodore, Chad, and Acca, the power and glory of Northumbria, and events in the recent past. Each division contains memorable events told with

extraordinary but restrained artistry: Gregory the Great's apostolic love for the English, the conversion of King Edwin and his people, King Oswald and St. Aidan, Abbess Hild and the poet Cædmon.

Bede's title tells us that his work belongs to the genre and tradition of ecclesiastical history, based on biblical rather than classical concepts of time and event, presupposing a theocentric universe in which the secular is understood in terms of the sacred, tracing the progress of the church as it advances in time and geography. Furthermore it is "of the *English* people," treating the Anglo-Saxons as one nation, God's chosen, even though divided into kingdoms and privileging Northumbria in the later books. The first three books of the *History* deal primarily with the Christianization of the English; the last two describe the way in which the Christian life developed among them, especially in Northumbria. The first book sweeps through 650 years, whereas each of the remaining four covers about a generation. Dedicated to Ceolwulf, king of Northumbria (729–37), the *History* emphasizes the good and bad influence of various Anglo-Saxon kings; it also stresses the influence of the clergy and their activity, offering as models John of Hexham (Beverley), Aidan, and especially Cuthbert, with whom the *History* comes to a climax in book 4.27–32. In contrast to Stephen's admiring *Life of Wilfrid*, Bede adroitly diminishes the worth and importance of Bishop Wilfrid by downplaying his role in the Northumbrian church and passing over in silence some major facts in Wilfrid's career, such as the Council of Austerfield, even while giving Wilfrid credit for gaining the victory of the Roman practice of Easter-dating and tonsure over the Irish faction under Coimán at the Synod of Whitby in 664.

The *History* is written in a soberly elegant Latin. It was translated into OE during the period of King Alfred. Over 150 manuscripts from the Middle Ages and many editions and translations of the *History* attest to its perduring importance and interest. No one was comparable to Bede as an historian until the 12th century, and his work still provides medieval English historians with endless topics for research and discussion.

Bede wrote a number of formal instructional letters, one of which has great historical importance, his late *Letter to Ecgbert*, a disciple who was to become the first archbishop of York (735) and whose brother Eadberht would become king of Northumbria (737). Whereas the *Ecclesiastical History* ends on an optimistic note of Christian progress, the letter paints a bleak picture of greed, subterfuge, and fraud. Outspoken and condemnatory of pseudo-monasteries and ecclesiastical and secular abuses, Bede details a program of reform. To meet the needs of far-flung and hard-to-reach communities, he proposes that new bishoprics be founded, based, and financed at prosperous monasteries.

Bede became an author in great demand after his death. By the 9th century

the admiration for Bede was so extensive that he was considered a Father of the Church. Venerated now by Anglicans and Catholics alike, he bears the title of saint and doctor of the Catholic church.

Bedford, John Duke of (1389–1435)

Third son of Henry IV; created duke of Bedford in 1414, he was a courageous soldier and gifted administrator. He served with distinction during the reign of his brother, Henry V, safeguarding the Scottish border and defeating a Franco-Genoese fleet at the Battle of the Seine (1416). After Henry’s death in 1422 he became Regent of France. His determined efforts to protect the rights of Henry VI, the young heir of Henry and Katherine of Valois, were a remarkable accomplishment upon which his fame and political reputation deservedly rest.

In the first years of regency Bedford was able to extend Henry V’s conquests. His emphatic victory at Verneuil (1424), where he fought with “the strength of a lion,” led to the subjugation of Maine and northern Anjou. But the advent of Joan of Arc in 1429 transformed the situation. The English were forced onto the defensive, and Bedford, conservative in religious outlook, saw Joan as a witch whose enchantments and sorcery punished the English for a lack of sound faith. The constant campaigning of Bedford’s last year wore

away his strength; his death in September 1435, combined with the defection of the Burgundians as allies, dealt Lancastrian France a blow from which it never recovered.

Bedford earned high praise from English and French chroniclers alike. A great landowner and possessor of rich manuscripts, vestments, and plate, he cleverly exploited the media of painting, pageantry, and poetry to promote the cause of the dual monarchy of Henry VI over England and France. His strong sense of justice, whether disciplining his troops or punishing brigands, won him universal respect. His encouragement of trade and commerce led to a revival of Normandy's economic fortunes; his willingness to employ French administrators and his use of native institutions gave his regime considerable authority.

Less of a diplomat than Henry V, Bedford sometimes allowed pride and quick temper to get the better of him. His relations with the Burgundians were not always easy, and he never fully gained the confidence of the English aristocracy. His regency nevertheless was a superb political and military accomplishment.

Benedict of Aniane (d. 821)

Benedict (original name Witiza) of Aniane, was the son of a Visigothic count. In 780, after a period as a monk at St. Seine (Langres), he founded a reformist monastery at Aniane on his family's property in southern France. He imposed

the strict observance of the Benedictine Rule, in contrast with the mixed observances common elsewhere, and when Louis the Pious succeeded Charlemagne Benedict was installed near Aachen in the specially founded monastery of Inden (consecrated 817; later known as Cornelimünster) in order to extend the reforms under royal patronage. Reforming councils were held at Aachen in 816 and 817, and the resulting decrees were issued between 816 and 819. Their main purpose was to establish uniform observance in monasteries following the “original” text of the Benedictine Rule (the *textus purus*), but they also included supplementary customs formalizing certain practices of daily routine that differed from or were not covered by the Rule itself.

The 10th-century reform in England was greatly influenced by these developments. The text of the Rule that was introduced was the continental *textus receptus* (received text), which had resulted from Benedict’s reforms by mingling readings from the newly imposed *textus purus* with those of the previously circulating *textus interpolatus* (interpolated text). The Aachen decrees circulated widely; the reformers aimed (with royal support) for uniform observance; and they issued the *Regularis concordia* as a supplementary customary. This drew extensively on the *Memoriale qualiter*, which was one of the supplementary texts circulating with the Aachen decrees. It is doubtful whether Benedict was the author of this text, but he was responsible for its dissemination. There are five complete copies extant from Anglo-Saxon England and one part-copy, which was provided with a vernacular interlinear gloss; this glossed text is edited under the misleading title of *The Epitome of Benedict of Aniane*.

Benedict of Nursia (ca. 480–ca. 560)

A south Italian abbot and, like many other monastic leaders of his day, author of a monastic rule for his small community. By virtue of the wide adoption of that slender manual, the Benedictine Rule, Benedict became the most famous monk in the world and the patriarch of western monasticism, designated by Pope Paul VI (1963–78) “the patron of Europe.” For some centuries the first and only life of Benedict was the hagiographic account by Pope Gregory the Great in the second book of his edifying *Dialogues*. Writing in 593–94, Gregory composed this melange of fact and legend at least a generation after Benedict’s death; but historians accept as factual the bit of biographical data Gregory said he received from four of Benedict’s disciples.

After education in Rome Benedict turned to religious life, first with a small community at Enfide and then as an anchorite near Subiaco. Attracting disciples because of his holiness, and sometimes alienating them because of his severity, Benedict eventually returned to communal religious life, organizing monasteries first in the Subiaco region and later (ca. 529) on Monte Cassino, in Campania halfway between Rome and Naples.

Benedict’s real claim to fame is the rule he composed ca. 526. “This little rule for beginners” is based in part on the nearly contemporaneous *Rule of the Master*, but a comparison of the two reveals why Benedict’s has been awarded the crown by history and the monastic movement. Gregory designates it well as a rule “remarkable for its discernment.” The Rule is a relatively short document, consisting of a prologue, 72 brief chapters, and an epilogue. The chapters, laying down the principles of monastic life and practical directives for living it, are not logically ordered; chapters 67–72 are an appendix attached to 66.8, and the liturgical and penitential codes (8–18, 20–23) may have been inserted later. But for all its lack of order and elegant language it judiciously presents the basic principles of cenobitic life. It advocates a spirit of charity for the whole monastic family and an egalitarianism (e.g., priests have no special rank); its concern is not for the heroic achievers but for the weaker, more needful members of the group: “In drawing up its regulations, we hope to set down nothing harsh, nothing burdensome” (Prologue, 46).

During the 7th and 8th centuries the Rule was only one among many in use. In England Celtic monasticism had propagated over the north from the Irish foundation of Iona, whereas in the Midlands several foundations seemed to follow composite rules. Wilfrid was the first to introduce the Benedictine Rule in England for his Northumbrian monasteries at Ripon (ca. 661) and Hexham (674); Wilfrid also served as director of other monasteries of men and women. Benedict Biscop, founder of the joint monastery of Wearmouth (674) and Jarrow (681), whose most illustrious monk was the historian, exegete, and educator Bede, introduced a rule heavily influenced by the Benedictine but assembled from six different models. In the southwest near Winchester,

Nursling, the home community of Boniface (Wynfrith), followed the Benedictine Rule.

Regular monastic life was greatly disrupted and in places disappeared during the troubled 9th century. Despite the attempts of King Alfred (871–99) to restore monastic life by founding the convent of Shaftesbury (which succeeded) and the monastery at Athelney (which did not), religious life languished. In the 10th century, under the close support of King Edgar (957–75), three dynamic monks, Dunstan (abbot of Glastonbury and later archbishop of Canterbury), the authoritarian Æthelwold (abbot of Abingdon, later bishop of Winchester), and Oswald (who became bishop of Worcester and later archbishop of York), imported the Benedictine Reform from the Continent and reinvigorated monastic life. To enforce the Benedictine Rule buttressed by effective continental and native regulations, they promulgated a code of approved practice, the *Regularis concordia* (ca. 970). The monasteries, some 40 in number with none in the north, were declared free of dependency on local nobles and became powerful supporters of the West Saxon monarchy.

Thanks to the renewed energies that resulted from the Reform, the monasteries again became centers of learning and art, providing education and culture. Æthelwold's school at Winchester developed a highly refined Latin style and produced the two finest OE prose stylists and preachers, Ælfric and Wulfstan. It was during this period that much Anglo-Latin and most extant OE texts were written, created for the most part in Benedictine scriptoria. Canterbury was especially active as a writing center, and Winchester gained particular renown for manuscript illustration, identifiable as "the Winchester School."

As the guide for traditional Benedictines (Black Monks and Nuns), augmented for Cluniacs, and reformed by the Cistercians (White Monks), the Rule of Benedict continued to dominate life in religious orders until the advent of the friars (Franciscans and Dominicans) in the 13th century. Benedictine abbeys, priories, and cells became ubiquitous throughout the realm, sometimes enormously wealthy and politically and economically powerful under forceful leaders, such as Abbot Samson of Bury St. Edmunds (ca. 1135–1212). The order also continued to foster scholars and especially historians, such as William of Malmesbury (ca. 1095–ca. 1143), and at St. Albans Roger of Wendover (d. 1236) and Matthew Paris (ca. 1199–1259).

Benedictine Reform

After a period of decay this crucial reform movement led to a revival of Benedictine monasticism, culture, and learning in Anglo-Saxon England during the second half of the 10th century. It is intimately connected with the names of three prominent ecclesiastics—Dunstan, archbishop of Canterbury (960–88), Æthelwold, bishop of Winchester (963–84), Oswald, bishop of Worcester and archbishop of York (961/71–92)—and with King Edgar (957–75), their royal patron. Political ties and clerical connections had brought the English into contact with the main branches of the continental reform initiated

in the early decades of the century by Odo of Cluny and Gerard of Brogne. Dunstan's abbacy in Glastonbury (940–56) and that of his pupil and friend Æthelwold in Abingdon (ca. 954–63) can be seen as important preparatory stages on the way to a firm reestablishment of monasticism in England, but it was not until the accession of a king wholly dedicated to this cause and the promotion of its leading protagonists to key positions in the ecclesiastical hierarchy that the Reform could come to full swing.

Æthelwold apparently surpassed his fellow reformers in fervor and consistency; a good deal of what was achieved is due to his systematic endeavor and his skill in both religious affairs and worldly matters. In his own bishopric of Winchester he soon paved the way for a fundamental reorganization along monastic lines: by expelling the canons from the Old Minster with royal consent early in 964, he set the model for the typically English institution of monastic cathedrals presided over by monk-bishops; later in this year he also replaced the secular clerics in the New Minster by monks. Such new structures ensured the reform party an extended influence on Anglo-Saxon church life down to the parochial level.

By translating the Benedictine Rule into OE (ca. 970), Æthelwold made the central text of the Reform accessible to a less educated readership, including laypeople. His compilation of the *Regularis concordia*—the monastic customary that the Synod of Winchester in the early 970s agreed upon to reinforce, expound, and supplement the instructions of the Rule—marks another decisive step toward spiritual unity and uniformity in practice. To him we can also ascribe a number of primary sources that provide valuable firsthand information on the aims and progress of the Reform as seen by its chief promoters: “An Account of King Edgar’s Establishment of Monasteries,” originally designed to preface the OE Benedictine Rule, the “New Minster Foundation Charter,” drawn up to commemorate and justify the expulsion of the canons, and the prologue as well as the charterlike epilogue to the *Regularis concordia*. In the light of monastic claims to superiority and all-pervasive change the gloomy picture of clerical decadence and widespread religious disorder, painted here and in the lives of the saintly reformers, has to be viewed with due reservations.

While the age of Bede was revered as the Golden Age of Anglo-Saxon monasticism, the close cooperation between monks and monarchy had its historic model in the Carolingian symbiosis of secular and religious power personified by Emperor Louis the Pious (814–40) and the great reforming abbot Benedict of Aniane. King Edgar’s strong support for the reform movement, both nonmaterial and in the form of generous grants of land and privileges, was not merely an unselfish act of piety. His rights of interference in monastic affairs as codified in the *Regularis concordia* included a say in the election of

abbots, abbesses, and monk-bishops; he and his wife Ælfthryth exercised an exclusive patronage over all Benedictine communities in England. These in turn expressed their gratitude and loyalty to the monarchy in a daily series of intercessory prayers that constituted a regular part of the divine office, thus strengthening the royal position against a powerful nobility, parts of which, after Edgar's sudden death in 975, vented their dissatisfaction at the loss of former rights of control over religious houses in the so-called "antimonastic reaction."

The reform movement had a profound effect on Anglo-Saxon culture and society. Many Benedictine abbeys were founded or restored, especially in the southern parts of England, including such important centers as Ely, Peterborough, and Ramsey. The new spirituality found its expression in an elaborate liturgy stimulating creative productivity in the arts and crafts, in church architecture and music. The increase in education and learning furthered book production, intensified the exchange of manuscripts with the Continent, and brought about a revival of Anglo-Latin literary culture. Certain groups of reformed houses associated with the three principal reformers seem to have been instrumental in the development of different styles of Anglo-Caroline script. The comprehensive reform approach favored by Æthelwold also made him exert his scholarly influence on the standardization of OE as a literary language.

Faced with increasing political instability in the wake of renewed Viking attacks, the generation following the great reformers had a rich religious and cultural heritage to preserve and a demanding didactic mission to fulfill. Both these aspects are clearly reflected in the works of Ælfric and Wulfstan, who, firmly entrenched in the reformist tradition, at the turn of the millennium led religiously inspired English prose writing to new heights.

Benedictional of Æthelwold

The manuscript BL Add. 49598 is the sumptuous masterwork of the “Winchester School.” A poem in the manuscript tells that it was written for Bishop Æthelwold of Winchester (963–84), who ordered “many frames, well adorned and filled with various figures decorated with numerous beautiful colors and with gold.” Benedictionals contain episcopal blessings for delivery during mass on important feasts. They were rarely illustrated, and Æthelwold’s is the most lavish to survive, with 28 full-page miniatures (probably there were originally fifteen more), nineteen pages with decorative frames, and two historiated initials. A sophisticated script hierarchy complements the ornament.

Fig. 26. Benedictional of Æthelwold (BL Add. 49598), fol. 90v. St. Æthelthryth. Reproduced by permission of the British Library; London.

The miniatures fall into two broad categories: prefatory pictures and pictures within the text. The prefatory sequence of framed facing pages depicts the heavenly choirs. Included now are confessors, virgins, and apostles, but six leaves are missing. Wormald suggested, by analogy with the Galba Psalter (BL Cotton Galba A.xviii), that missing leaves depicted angels, patriarchs, prophets, martyrs, and a Christ in Majesty. The pictures within the text follow the order of the liturgical year, fusing the Temporale and the Sanctorale. Excepting

juxtaposed miniatures for Epiphany, each framed illustration faces a framed text page inscribed in gold with the opening words of the benediction for the feast. Illustrations of scenes from Christ's life are augmented by pictures pertaining to John the Baptist, Sts. Stephen, John the Evangelist, Benedict, and Peter, and the English Sts. Swithun and Æthelthryth (fig. 26). Miniatures of the Death and Coronation of the Virgin and of a bishop dedicating a church complete the book.

Much of the imagery is highly individualized, though probable pictorial sources have been identified for most of the miniatures. A sacramentary of the Carolingian Metz School and a Middle Byzantine lectionary likely furnished much of the narrative iconography and also influenced choice and arrangement of scenes. The Winchester artists' skills lay in their ability to synthesize disparate elements with visual references to a wide range of textual sources, producing in the process pictures of outstanding inventiveness and artistic merit.

Several themes are expressed, and the artists developed to a high degree the systematic repetition of individual motifs in successive pictures to emphasize their meaning—a technique Deshman has called “serial symbolism.” The themes are united by reference to the Winchester liturgy and thought-world of the owner of the book. Indeed, in some ways, the manuscript is a manifesto for the monastic reform promulgated by Æthelwold and the king he served, King Edgar; ideologies of monasticism and rulership permeate the pictures, which were probably executed close to the date of Edgar's imperial consecration and coronation in 973.

The striking visual impact of the book stems from many factors, including an unusually varied yet subdued palette, offset with white and liberal use of gold. Most distinctive, however, are lush frames, exuberant figural style, and the symbiotic relationship between the two. Individual elements of the frames were taken from earlier continental art: rich, fleshy acanthus from the Metz School; linear, bossed frames from Franco-Saxon art. The synthesis was outstandingly creative, drawing on a deep insular love of ornamental intricacy and ambiguous relationships between frame and picture. The ambiguity was enhanced by the richly dynamic and expressive linearity of rippling “Winchester School” drapery, whose forms often echo those of the acanthus, yielding pages with dense surface patterning recalling the carpet pages of Hiberno-Saxon art.

Beowulf

Beowulf, by consensus the greatest literary work of the Anglo-Saxon period, tells the story of Beowulf, a hero of the Geats, a Germanic nation located probably in what is now southern Sweden. At the beginning of the 3,182-line poem Beowulf comes to the aid of Hrothgar, king of the Danes, whose magnificent hall Heorot has for twelve years been ravaged by the nocturnal man-eating monster Grendel, a descendant of the exiled Cain. Fighting

without weapons, Beowulf tears off the arm of the monster, who flees to his home to die. The very next night, after the victory celebration, Grendel's vengeful mother slips into Heorot and carries off one of Hrothgar's sleeping retainers; in the morning Beowulf seeks her out in her home—a cave accessible only from the bottom of a deep lake or inlet—where he is nearly defeated, but saves himself when he finds a huge sword made by giants. With this he kills Grendel's mother and decapitates Grendel's corpse, bearing the head back to Heorot as a trophy. He returns to the Geats laden with treasure, gifts from a grateful Hrothgar, who predicts that Beowulf will become a king and warns him against greed and pride.

Much later, after Beowulf has been king of the Geats for 50 years, someone accidentally awakens a sleeping dragon by stealing a single cup from its hoard. Enraged by the loss, the night-flying dragon burns houses, strongholds, and Beowulf's own hall. The next morning Beowulf, protected by an iron shield and accompanied by the thief and eleven retainers (whom he orders to stay out of the battle), confronts the dragon. The fight goes badly until Beowulf is joined by Wiglaf, an untried retainer; together they kill the dragon, but not before it has wounded Beowulf with its venomous fangs. Before his death the old king has just enough time to admire the treasure that he has, as he says, won for his people; amid sorrowful dirges and predictions of war, his retainers bury him in a magnificent mound, and the dragons hoard with him.

This simple tripartite storyline (organized around the three monster fights) is generously supplemented by historical and legendary material. For example, the poem describes in some detail the biblical background of Grendel's family, and after the defeat of Grendel court poets sing tales of Sigemund the dragonslayer and of the ancient feud between Finn, king of the Frisians, and Hnæf, king of the Danes. Dark allusions to future Danish troubles culminate in Beowulf's prediction, presented in some detail, of war with the Heathobards—even though Hrothgar has arranged a political marriage between his daughter Freawaru and the Heathobard king Ingeld. Even more ominously the story of the dragon fight is nearly overwhelmed by accounts of the intermittent feud between the Geats and the Swedes, which claimed the lives of two of Beowulf's royal predecessors and is certain to break out again after his death.

Beowulf is preserved in a single manuscript, BL Cotton Vitellius A.xv, written within a couple of decades of A.D. 1000. Three of the four other OE texts in the manuscript also deal prominently with monsters: they are a life of St. Christopher, an apocryphal letter from Alexander the Great to Aristotle, *The Marvels of the East*, and the poem *Judith*. The Cotton Library fire of 1731 made the edges of the leaves brittle, and on most pages the margins and some of the text have crumbled away. Modern editors have restored lost words in *Beowulf* by referring to two transcripts made in the 1780s, before the damage

had become extreme. Beyond the material facts of the text's existence we know very little. Until recently it was widely believed that it was an 8th-century production, but examination of the linguistic and metrical tests used to arrive at that date has cast considerable doubt on their validity. Recent scholarship has also found that historical arguments in favor of the 8th century (e.g., that an English poet would not have written admiringly of the Scandinavians after the 790s, when the Viking wars began) can be almost precisely reversed: the Viking wars brought Scandinavian settlers, who during much of the later Anglo-Saxon period maintained friendly relations with their new neighbors. The former consensus that *Beowulf* was written in Northumbria has received less discussion, but it seems no better grounded than the older arguments as to its date. In the present state of our knowledge there is little reason to prefer an early date over a late one (dates as late as that of the manuscript have been suggested), or the north of England over the Midlands or the south.

As controversial as the question of *Beowulf*'s date and place are those of the manner of its composition and the nature of the materials that went into its making. Like most OE poems this one comes to us without an author's name, and it may well be that it never had an author, in the modern sense of a person who is responsible for the very words of a work from its beginning to its end. There is ample evidence that medieval writers often assembled works from preexisting materials, and many works—especially vernacular ones—were subject to expansion, condensation, and other kinds of revision in the course of copying from manuscript to manuscript. It is likely that, even if we had for *Beowulf* records as extensive as we have for, say, James Joyce's *Ulysses*, we would find it impossible either to identify one person who was primarily responsible for it or to distinguish clearly between its composition and the transmission of its text after composition.

In light of such considerations the long-running debate between those who see *Beowulf* as having been composed by an oral poet like those depicted in the poem and those who consider it a written composition loses much of its meaning. Almost certainly oral history and song were the ultimate sources of the poem's tales of preliterate pagan antiquity, but we now possess a written text whose immediate exemplars, at least, were probably written. We can assume neither that the originally oral tales were first written down in their present form nor that, once the written text had assumed something like its present shape, later additions and revisions were based exclusively on written materials. Speculation as to how much of the process that produced the text was oral and how much of it written has a limited prospect of success. The same considerations render less promising the question of the poem's intended audience. We know on the one hand that heroic poetry could be appreciated in

the monasteries and on the other that well-to-do laypersons could own manuscripts like Cotton Vitellius A.xv; critics' views on the question of audience tend to line up conveniently with their views on questions of interpretation, such as whether we should understand Beowulf as, say, a figure of Christ or as a role model for young princes.

Beowulf in short, is a poem unaccompanied by the external facts that we take for granted in later literature—a poem without a context more specific than that it was produced in England during a period of some three centuries. In its rich supplementary material, however, and in its commentary on the action it describes it does provide some of its own context. For example, it is minutely concerned with artifacts. Both the narrative voice and the people of whom it tells often pause to admire helmets adorned with talismanic boars, swords with serpentine patterns, newly tarred ships, and golden jewelry; sometimes the narrative stops entirely while we learn, say, the history of the sword that Wiglaf carries into battle or the future history of the necklace that Hrothgar's queen, Wealhtheow, gives to Beowulf. Such objects as these become signifiers—"words" in a sense—not only linking the action to its physical context but also offering a commentary on that action: thus the spirit and energy of Beowulf's men, newly arrived in Denmark, are conveyed by their shining and singing mail coats, and the "sermon" that Hrothgar delivers to Beowulf is given a historical and theological context by an inscription on the hilt of the giant sword describing God's destruction of the race of giants in the Flood. It is worthwhile to read *Beowulfwith*, a book on Anglo-Saxon archaeology close at hand; scholars have noted an especially strong resemblance between the objects described in the poem and those found in the Sutton Hoo ship burial.

Perhaps the most important contextual element that *Beowulf* supplies for itself is its thoroughly Christian point of view. Its depiction of paganism is selective (it describes funerary practices and the consultation of omens but never names the pagan gods) and rarely judgmental (it once notes with sadness that the Danes condemn themselves to damnation when, through ignorance of the true God, they make offerings to idols). Indeed this "paganism" seems for the most part to be consistent with Christianity: the poems characters know nothing of Christ and his saints, but they speak of one God, and they believe in an afterlife where every man is judged according to his deeds. Whether the poem views them as able to achieve salvation is a matter of controversy; the only clue is an ambiguous one. When Beowulf dies, the poem says, "his soul departed from his breast to seek the judgment of the righteous"—a phrase that leaves it unclear whether he will be judged to be righteous or judged by those who are righteous.

The poems refusal to resolve such matters as this is frustrating to some

readers, but others have identified it as a major stylistic technique, not only of *Beowulf* but of much OE poetry. Where conventional modern fiction normally resolves its narrative components into a single structure from which it produces meaning, *Beowulf* juxtaposes its various components without insisting on any particular relationship among them. For example, after a poet in Hrothgar's court tells the story of the Frisian king Finn, focusing particularly on his wife, Hildeburh, who loses brother, son, and husband to a feud among men, Wealhtheow delivers a speech whose apparent purpose is to avert similar losses within the Danish royal family. Then the men go to bed and Grendel's mother arrives to avenge the loss of her son. No comparisons are drawn among these narrative elements; no cause-and-effect relationship is implied; no commentary of any kind links them. They share enough elements—all concern women who lose their sons, or may lose them—that we are tempted to look for connections, but we can just as easily leave them alone.

The same tendency can be discerned in the structure of the poem as a whole. The fights with Grendel and his mother take place in Beowulf's youth, over a two-day period; the rest of the poem describes the last day of Beowulf's life, more than 50 years later. No explicit conclusions are drawn from the relationship between these narrative elements, and some have seen the long gap between them as a flaw. The great commentator J.R.R. Tolkien, on the other hand, claimed that this bifurcated structure contributed to the meaning of the poem: *Beowulf* he wrote, "is essentially a balance, an opposition of ends and beginnings. In its simplest terms it is a contrasted description of two moments in a great life, rising and setting; an elaboration of the ancient and intensely moving contrast between youth and age, first achievement and final death." Generations of OE scholars have found Tolkien's interpretation powerfully attractive, but other formulations are possible. It is not quite true that the events of the 50 years that separate the monster fights go undescribed; rather, tales of the wars fought by Beowulf and his predecessors on the Geatish throne are displaced into the background of the dragon fight, where they are told fully, though out of chronological order, by Beowulf and by the messenger who announces his death to the waiting Geats. Similar tales form the backdrop of the fights with Grendel and his mother, and the story of Freawaru and Ingeld, told by Beowulf on his return home after those fights, makes the point that old strife is inevitably renewed, whatever measures men and women take to forestall it. If one sees the foreground narratives as illustrating this theme in more abstract fashion, the poem becomes not so much "an opposition of ends and beginnings" as a more seamless tale (despite the 50-year gap) of the futile attempts of men and women to contain the surging violence that continually threatens their fragile institutions. The poem gives us little or no help in choosing among these and other readings; its structure and poetic technique

seem hostile to the business of interpretation.

Research into *Beowulf's* analogues and historical background has fared better than interpretation as a literary industry. The poem connects with what modern readers think of as “history” at one point only: Gregory of Tours, in his *History of the Franks*, records that in the first quarter of the 6th century one “Chlochilaicus,” king of the Danes, was killed while plundering along the Frankish coast; he is generally identified with *Beowulf's* Geatish king Hygelac, who, the narrative voice sternly notes, got no more than what was coming to him. Another English source, the *Liber monstrorum* (*Book of Monsters*) agrees with *Beowulf* that “Huiglaucus” was king of the Geats, but the 13th-century Icelandic Snorri Sturluson writes in *Heimskringla*, his history of the kings of Norway, that “Hugleikr” was a Swedish king who preferred staying home to making war in distant lands. The apparent discrepancies among these accounts illustrate the difficulty of working with sources based on oral history, which tends to be variable. It is often difficult to be sure whether two sources that use similar names are speaking of the same person, for as such histories are told and retold, kings sometimes change their nationalities, family members exchange names, and heroes gather new exploits to their fame.

Despite the uncertainties, there is little doubt that most of the characters mentioned in *Beowulf* are spoken of in Germanic legend, and especially in Icelandic sagas and legendary histories. The great exception is *Beowulf* himself, who is mentioned nowhere outside the poem. He represents, however, a type of character well attested in the Icelandic sagas. He has a close analogue in (some say he is the same person as) Boðvarr Bjarki of *Hrólfs saga kraka*, and his fights against Grendel and his mother resemble those of such characters as porir of *Gull-Poris Saga*, Grettir the Strong of *Grettis saga*, and Samson the Fair of *Samsons saga fagra*. The tales in which these heroes figure resemble a type of folktale called “The Three Stolen Princesses,” in which a hero first defeats a monster in a house and later rescues three princesses by pursuing to a lower world the monster that has kidnaped them; he kills the monster with a sword he finds there and later marries one of the princesses. Though *Beowulf* wins no princess, he resembles the heroes of “The Three Stolen Princesses” in being of great, perhaps supernatural, strength; further, these heroes are frequently the offspring of bears, and the name “*Beowulf*” has often been etymologized as “bee-wolf”—that is, the bear, enemy of bees.

Analogues for *Beowulf's* dragon-fight episode are less exact, though heroes of many times and places have tested their strength against dragons. Boðvarr Bjarki fights a winged flying beast, and several Scandinavian sources tell how Sigurðr (equivalent to Siegfried in the Middle High German *Nibelungenlied* and to Siegfried's father Sigemund in *Beowulf*) killed a dragon. Beyond the presence of a dragon, a hero, and a sword, however, resemblances among these

stories are slight.

In view of *Beowulf's* many connections with folklore and Germanic legend, and the esteem in which it has been held since its first appearance in print in 1815, one might guess, and some have believed, that it was highly valued in its own time—that it was to the Anglo-Saxons as the Homeric epics were to the Greeks or Virgil's *Aeneid* to the Romans. There is, however, no evidence at all to suggest that this was the case. *Beowulf* is not mentioned, quoted, or alluded to once in extant records from Anglo-Saxon England. It has stylistic affinities with *Andreas*, the OE poetic legend of St. Andrew, but it is not clear that one influenced the other or, if there was such influence, in which direction it went. If we take numbers of surviving manuscripts as a rough guide, we must conclude that prose works like the translations of King Alfred, the sermons of Ælfric and Wulfstan, and even the OE *Herbarium* were valued more highly than any OE poem—except for a few that seem to owe their popularity primarily to being embedded in prose tracts. Among poems devotional works like *Soul and Body* and the metrical Psalms seem to have been valued more highly than heroic ones like *Beowulf Waldere*, and *The Battle of Finnsburg*. To observe that *Beowulf* may well be enjoyed more widely now than in its own time is not at all to denigrate it but rather to remind ourselves that since taste is determined by factors that vary with time and place, we can do little more than guess at the status of the work in the culture that produced it. Like Keats's Grecian urn *Beowulf* in its stately isolation, tempts us beyond the bounds of the knowable. And yet it is sufficient in itself, its subject being a fundamental one: the struggles of men and women to survive and to protect their social order from the mysterious foes that threaten them from without, and from the equally mysterious foes within.

Berners, Juliana (fl. ca. 1460?)

Possible author of material on hunting and hawking in *The Book of St. Albans*, which attributes its hunting section to “Dam Julyans Barnes.” Biographical accounts are often highly speculative and romanticized.

The Book of St. Albans, published in 1486, contains prose hawking and heraldry treatises and a verse hunting treatise. It remained popular into the

17th century. The *Book* draws upon a rich medieval tradition of teaching the fundamentals of polite education, with particular emphasis on proper use of technical sporting terminology. Major sources include the hawking treatise called *Prince Edward's Book* (date uncertain) and two 15th-century translations of earlier French works: William Twiti's Anglo-Norman *Art of Hunting* and Gaston Phoebus's *Livre de Chasse*, translated as *The Master of Game* by Edward, duke of York (d. 1415). Like Malory's *Morte Darthur* the hunting treatise in the *Book of St. Albans* names Tristram as the originator of hunting literature.

If Berners did write parts of the *Book of St. Albans*, she has shared the fate of many medieval women writers in that questions of biography and authorship have been the focus of much related scholarship. The *Book of St. Albans* is frequently belittled as a compilation from other sources (a common feature of hawking and hunting treatises generally). But compilation was a respected form of literary production in the late Middle Ages, with examples ranging from practical treatises to collections like the *Canterbury Tales*.

Bestiaries

A wide variety of manuscripts comprising chapters drawing Christian lessons from the supposed appearance or behavior of animals were known to their medieval users as bestiaries. These books are all ultimately derived from a 2nd-century Greek text known as the *Physiologus*, or “natural philosopher,” which was translated into Latin by the end of the 4th century. Their variety lies in their length, ranging from fewer than 30 chapters to over 200, and in their organization.

A complete *Physiologus* contains some 37 chapters arranged according to their

Christian lessons rather than zoologically. Thus the antelope that gets its horns entangled in a shrub to which it is addicted, and the fire stones that are normally inert but catch fire when two are brought together, form successive chapters of the *Physiologus* because both offer warnings against vices: intemperance and lust, respectively. Both the organization of the *Physiologus* and its orality (the simple, memorable stories, repeated phrases, and occasional use of the vocative to address an audience) suggest that it was designed as a preaching text.

What distinguishes the bestiary from a *Physiologus* are modifications of the text and chapter order. The earliest surviving Latin bestiary produced in England (Bodl. Laud misc. 247; [fig. 27](#)), probably written at Canterbury ca. 1110–30, differs from the *Physiologus* only in having short extracts from the *Etymologiae* of Isidore of Seville (ca. 560–636) appended to most of the chapters, but later recensions of the bestiary made more extensive use of Isidore's work. This had important consequences. The *Etymologiae* is an encyclopedia covering the whole of Creation and was intended to reflect this in two ways. First, it groups together those creatures made on the same day of Creation. Second, it was concerned with explaining animals' names: the eagle (*aquila*), for example, is named after the acuteness (*acumine*) of its vision. Since the animals were given their names by Adam according to their natures, these names echo the organization of the natural world as seen by the first man immediately after Creation. Bestiaries reorganized along Isidorean lines, like St. Petersburg, Saltykov-Shchedrin Q.v. V. 1, often include the Genesis account of Creation in their text and have a set of Creation scenes culminating in Adam naming the animals at the beginning.

This reorganization destroys the old *Physiologus* structure, so that the work can no longer be used for preaching. Moreover Isidore's text was not designed for reading aloud like the *Physiologus*: it is too concise. These expanded bestiaries could still be used by preachers, not directly, but rather as a source book or *summa*.

At the end of the 12th century and throughout the 13th luxury bestiaries were produced with high-grade script and lavish miniatures decorated with gold and expensive pigments. The St. Petersburg Bestiary is one such, and a close copy, now New York, Pierpont Morgan Library M.81, was presented to Workshop Priory in 1187 along with other luxury books, perhaps to mark the consecration of a new church. Another luxury book, the only bestiary with evidence of secular patronage, is a mid-13th-century manuscript (now Bodley 764 in the Bodleian Library), which may have belonged to the Marcher baron Roger de Monhaut, lord of Mold.

Latin bestiaries were primarily English books of the 12th and 13th centuries, although some were produced in France and Germany as well. The religious

orders, principally the Cistercians, were their main users. Examination of the sermons of Aelfred of Rievaulx shows massive and regular borrowings from the bestiary. When, from the early 13th century, preachers like Stephen Langton and Odo of Cheriton began to answer the call for sermons aimed at the laity rather than a monastic audience by including exempla drawn from everyday life, the bestiary was doomed as a source book. The luxury appeal of presentation volumes extended its life to a degree, but although a few 14th- and even 15th-century bestiaries survive, the great age of bestiary production was over by the end of the 13th century.

Bible in Middle English Literature

From the earliest days of Christianity the Bible has been seen in competition with secular literature. St. Jerome, after a period of divided loyalty, put the famous question, “What has Horace to do with the Psalter, Virgil with the Gospels, and Cicero with the Apostle [Paul]?” (*Epistle* 22). In the OE period Alcuin echoed this sentiment by asking, “What has [the Germanic hero] Ingeld to do with Christ?” (*Epistle* 123). By the later Middle Ages accommodations had been found and articulated. Still, vernacular writers of the ME period who draw heavily on scripture tend to define their work in opposition to more popular or worldly forms of literature. They may call attention explicitly to the division, like the author of *Cursor Mundi*, who complains that many people are

less concerned to keep the commandments than “to here Romaunces”; or they may simply avoid mingling biblical and secular material, like Langland, who cites hundreds of biblical texts but almost no classical authors. The reverse is not true. The fabliau, whose essence is the violation of decorum, frequently drags the Bible into its comically distorted world. In Chaucers *Merchant’s Tale*, for example, lecherous January addresses his young wife in the words of the Song of Songs (2138–48), and later the pagan deities Pluto and Proserpina hurl biblical proverbs against each other.

The Bible most familiar to ME writers was Jerome’s Latin translation, the Vulgate, although the older *Vetus Latina* still circulated. Other sources of the biblical text included commentaries, the liturgy, and writings of the early Church Fathers. Thus medieval biblical quotations that vary from the Vulgate may have come to the writer from a different textual tradition or from an intermediate source; it is unhistorical to call them “inaccurate” (especially if the standard of comparison is the Clementine edition of the Vulgate, which was not issued until 1592).

Whatever the lines of transmission, the debt of ME literature to the Bible takes primarily the following three forms.

Translation and Paraphrase

In addition to such broad retellings as *Patience* (the story of Jonah) and the Corpus Christi plays (biblical history from Creation to Doomsday), the *Manual of Writings in Middle English* lists nearly 60 biblical translations, paraphrases, and commentaries (e.g., *Genesis and Exodus*, *Iacob and Iosep*, *Rolles English Psalter and Commentary*, the *Stanzaic Life of Christ*, and the Wycliffite versions of the Bible). Though generally conservative, many writers felt free to enlarge upon the implications of the biblical narrative, to update it, to fill in the gaps. The author of *Patience*, finding no explanation for Jonah’s reluctance to denounce the sins of Nineveh, makes a plausible inference: the prophet is afraid that he will be arrested in Nineveh, put in prison, and tormented (73–88). The poet of “It wes upon a Shere Thorsday” tries to illumine the mental state of Judas by inventing a conversation between him and his “soster” (Sisam, *Fourteenth Century Verse and Prose*: XV.G). The cycle plays expand bare mentions of Noah’s wife, Herod, and the shepherds at Christ’s nativity into full-blown characters. *Iacob and Iosep* is medievalized: knights, minstrels, and moated castles are common; in Egypt Joseph “sits in hall” like a medieval king.

Borrowings

The Bible is a major source of exempla, parables, and other kinds of narrative. Gower's *Confessio Amantis* illustrates vainglory by an account of Nebuchadnezzar. *Cleanness* is constructed around three examples of impurity from the Old Testament. Chaucer's Monk warns against trusting Fortune by the "ensamples trewe and olde" of Lucifer, Adam, Samson, Nebuchadnezzar, Belshazzar, and Holofernes, as well as classical and medieval figures. The parables of Christ are at the heart of such well-known works as *Pearl* (the pearl of great price, the vineyard) and *Piers Plowman* (the good Samaritan).

In retelling biblical stories ME authors frequently transform the mode. Lydgate relates the tale of a king whose paramour, Liberality, is displaced by the hag Avarice, an allegorization of the apocryphal 1 Esdras (Vulgate 3 Esdras) 4:29–31 (*The Pilgrimage of the Life of Man* 17, 360–432). Caxton's *Knight of the Tower* recasts the Redemption as a romance "Of the good knyght whiche fought ageynst the fais knyghte for the pyte of a mayde" (ch. 104). In the *Millers Tale* the story of the Flood is turned into parody; so too in the *Summoner's Tale* are the accounts of Eliezer's oath to Abraham (Gen. 24:1–4) and Pentecost (Acts 2).

Biblical imagery is commonplace. Behind Langland's description of Lady Meed lies the Whore of Babylon (Rev. 17); behind the celestial city at the end of *Pearl* is the New Jerusalem of the Apocalypse; behind numerous examples of the gardenlike setting known as the *locus amoenus* there are the garden of Eden and the *hortus conclusus* ("garden enclosed") of Canticles.

Single verses, quoted or echoed, are the most abundant form of scriptural borrowing. Close to 2,000 examples have been identified in Chaucer's works; of the nearly 1,200 quotations spread over the three versions of *Piers Plowman* about two-thirds are biblical. Quotations are used by ME writers in a variety of ways. Most frequently they confirm a point: "Ye legistres and lawieres, if I lye witejp Mathew: *Quodcumque vultis vtfaciant vobis homines facite eis*" (*Piers Plowman* B.7.60–60a). Sometimes they are self-defining: in the morality play *Mankind* Mercy declares, "The justice of God will as I will... *Nolo mortem peccatoris*" (833–34); sometimes self-incriminating: Chaucer's Pardoner says, "My theme is yet, and evere was, *Radix malorum est Cupiditas*" (*PardPro* 425–26). They may furnish the refrain or *donée* (textual starting point) of a lyric poem: Isaiah 63:1, "Quis est iste, qui venit de Edom?" ("Who is this that cometh from Edom?"); Psalm 144:9, "Et miserationes eius super omnia opera eius" ("And his tender mercies are over all his works"); Canticles 2:5, "Quia amore langueo" ("Because I languish with love") (Carleton Brown, *Religious Lyrics of the XIVth Century*, 2d ed.: nos. 25, 95, 132.) When quotations used in this way

are strung together, as in the *Prick of Conscience* and *Piers Plowman*, they may serve as the structural backbone of a passage. Even denser is the thicket of scriptural borrowings in the writings of Richard Rolle, about whom it could be said (as it has been of St. Bernard) that he “spoke Bible.”

Adaptation of Exegetical Techniques

The body of rules and approaches that grew up around biblical hermeneutics influenced the making and the reading of vernacular literature in three important ways.

First, the dialectical use of biblical authorities is a common feature in ME literature. In *Pearl* (stanzas 9–12) the maiden recounts the parable of the vineyard (Matt. 20:1–16) to show that God will reward according to his mercy; the dreamer objects on the basis of Psalm 61:12 that God will reward according to one’s deserts; the maiden responds that by this reasoning, nobody would be saved, “For non lyuyande to þe is justyfyt” (Ps. 142:2). Langland uses many of his biblical quotations in the same way. Probably the Wife of Bath is the most famous, if not the most adept, practitioner of the method.

Second, the fourfold interpretation of scripture (literal; allegorical; tropological, “pertaining to morals”; anagogical, “pertaining to the next world”) inspired vernacular authors to develop multiple levels of meaning in their own compositions. Near the end of the *Canterbury Tales* the Parson explicitly directs us to think not only of the literal but also of the anagogical pilgrimage, “Of thilke parfit glorious pilgrimage / That highte Jerusalem celestial” (*ParsPro* 50–51). An important aid to multifold exegesis was the *distinctio*, that is, an array of the various meanings of a word depending on its biblical context. Thus the word *bed* is taken in Canticles 3:7 to refer to the church, in Amos 6:4 to carnal pleasure, in Job 17:13 to eternal punishment. By the 14th century the use of *distinctiones* had become so commonplace in sermons as to seem, in the words of a medieval observer, “as cheap as silver in the reign of King Solomon” (Smalley, 1983: 248).

ME writers were not isolated from the *distinctio* nor from the kind of thinking it fostered. The author of *Pearl* exploits virtually every possible sense of his title. Langland systematically describes various kinds of *bread* in passus 13 and 14 of the B text: there is the “sour loaf” of *Agite penitenciam* (13.49); “payn for pope and provendre for his palfrey” (13.243); the literal “wafres” of Haukyn (13.263); “a pece of pe Paternoster... *fiat voluntas tua*”(14.49–50); the manna of the Hebrews in the wilderness (14.64); the *habundancia panis* of the Sodomites (14.77ot); and, providing an anagogical focus for all these, the

allusion in 14.3a to Christ's parable of the feast (Luke 14:15–24), which begins "Beatus qui manducabit panem in regno Dei."

Third, and most important, the poetic imagination was affected powerfully by the exegetical habit of reading the Old Testament as a préfiguration of the New. Christ himself encouraged the practice: "For as Jonas was in the whale's belly three days and three nights, so shall the Son of Man be in the heart of the earth three days and three nights" (Matt. 12:40). Exegetical tradition developed numerous other typologies, many of which entered the visual arts and the homiletic tradition, thereby reaching nonliterate as well as literate audiences. The Virgin Birth is foreshadowed by the burning bush; the Crucifixion by the sacrifice of Isaac; the Harrowing of Hell by Samson's carrying off the gates of Gaza. Such correspondences were elaborated by ME poets, most notably in the Corpus Christi cycles (where typology may have influenced the actual selection of stories) and in the lyrics (e.g., "Marye mayde mylde and free" [Brown, *Religious Lyrics of the XIVth Century*, 2d ed.: no. 32] and the Prioress's hymn to the Virgin in the *Canterbury Tales* [PriorPro 453–87]). Moreover, having learned to think in this way, poets went on to create new correspondences. The nativity of Christ, the Lamb of God, is prefigured in the *Second Shepherds' Play* by a false nativity, a stolen sheep swaddled to look like a child. The fall becomes a universal paradigm of experience, not only for humans but even (the *Nuns Priest's Tale* would have us believe) for roosters. Eventually, as illustrated by the corresponding triads in part 3 of *Sir Gawain and the Green Knight*, typological thinking frees itself entirely from its biblical matrix.

Bible in Old English Literature

As the central literary document of a Christian culture the Bible played an important role in most, if not all, of Anglo-Saxon literature. The modern English word “bible,” from Greek *ta biblia* (“the books”), is not attested from the period; the *Oxford English Dictionary* cites *Cursor Mundi* as the first vernacular use, although the earliest example in Anglo-Latin is a book list from Durham Cathedral dated to 1095. A second Latin term for the Bible, “bibliotheca,” appears in the writings of Aldhelm and Alcuin and occurs as *bibliodece* in vernacular writers, such as Ælfric. The common way, however, of referring to the Bible is with the term (*ge*)*writ*, a translation of Latin *scriptura*; the OE word is used of other writings as well.

One reason for this more general terminology is that single volumes containing the entire Bible were rare, particularly during the early period. Aside from the Codex Amiatinus (Florence, Biblioteca Medicea-Laurenziana Amiatinus 1), which was inspired by the arrival in Northumbria of Cassiodorus’s Codex Grandior, a large, illustrated volume containing the Old Testament, and was written to be sent to Rome, the earliest complete Bible that survives from Anglo-Saxon England dates to the end of the 10th century (BL Royal I.E.vii and I.E.viii). From the 11th century are Cambridge, Trinity College B.5.2; Durham, Cathedral Library A.II.4; Lincoln, Cathedral Library 1; and San Marino, California, Huntington Library HM 62. Certainly there were others—including two made at the same time as the Amiatinus, of which only fragments remain (BL Add. 37777 and 45025)—but it was more common for

parts of the Bible to circulate independently.

The manuscript evidence suggests that the most readily available books were the Psalms and the Gospels, and there are OE terms for both. OE *saltere* denotes codices containing the Psalms, often combined with other liturgical texts, such as canticles. Eighth-century manuscripts include the Vespasian Psalter (BL Cotton Vespasian A.i), the Salaberga Psalter (Berlin, Deutsche Staatsbibliothek Hamilton 553), and the Morgan Psalter (also known as the “Blickling Psalter”; New York, Pierpont Morgan Library 776). Like the Psalter the Gospels survive in many manuscripts and are referred to with OE terms, *godspel* and *Cristes boc*. Still in dispute are the origins of some early gospel books possibly produced in northern English centers under Irish influence; the important witnesses are the Book of Durrow (Dublin, Trinity College 57), the Book of Kells (Dublin, Trinity College 58), the Durham Gospels (Durham, Cathedral Library A.II. 16), and the Lindisfarne Gospels (BL Cotton Nero D.iv). Also important as a witness both of the insular tradition and of a missionary text on the Continent are the Echternach Gospels (Paris, BN lat. 9389).

Not only does the semantic range of words for the Bible differ from modern usage, the text itself is not as firmly fixed during the period—particularly before the Carolingian reform—as it is today. Jerome’s translation of the Bible into Latin, now referred to as the Vulgate (that is, the “commonly accepted” version), was not immediately accepted in the early church, and readings from the previous *Vetus Latina* (the “Old Latin” version) continued to circulate in individual manuscripts and in commentaries. The Vulgate also contains five books—Wisdom, Ecclesiasticus, 1 and 2 Maccabees, and Baruch—that Jerome did not revise and that he apparently considered apocryphal. Some other apocryphal texts were known to the Anglo-Saxons; for example, Psalm 151 is often included in psalters, and in CUL Ii.2.11 the Gospel of Nicodemus follows the four canonical Gospels in West-Saxon.

Although much remains to be learned about the circulation of particular versions of biblical books in Anglo-Saxon England, a greater number of manuscripts containing the Psalms and Gospels permits some remarks about the roles of early missionary activity and the Benedictine Reform in the dissemination of these books. In the early period the Psalms occur most often in the Roman form—traditionally considered Jerome’s first revision of this book—with the manuscripts including the Vespasian, Salaberga, and Morgan psalters. This version also survives in three 10th-century psalters: the Bosworth (BL Add. 37517), the Royal (BL Royal 2.B.v), and the Junius (Bodl. Junius 27). With the Benedictine Reform manuscripts of the Gallican version—by Jerome and accepted by Alcuin for his redaction—became more prevalent; two 9th-century psalters from Reims—Cambridge, Corpus Christi College 272, and Utrecht, Universiteitsbibliotheek 32 (the Utrecht Psalter)—are among the

Gallican psalters that were known in Anglo-Saxon England. By the close of the period the Gallican version is better represented than the Roman. Finally, although the manuscript evidence is much slighter, mention needs to be made of the Hebrew Psalter—Jerome's last translation of the Psalms—since it is the Irish textual family of this version that appears in the Codex Amiatinus and thus shows some evidence of Irish missionary activity in Northumbria. Also, although from the mid-12th century and thus beyond the strict limits of the Anglo-Saxon period, Eadwine's Psalter (the Canterbury Psalter; Cambridge, Trinity College R.17.1) includes the Hebrew version, along with the Roman and Gallican versions in parallel columns: the Roman is glossed in OE and the Hebrew in French. Here, as in Salisbury, Cathedral Library 180, the Hebrew version is apparently related to Alcuin's revision.

The manuscripts of the Gospels reveal more of the early missionary activity in England. Cambridge, Corpus Christi College 286, and Bodl. Auctarium D.2.14, both written in Italy in the 6th and 7th centuries, respectively, represent the kind of mixed Italian text (so called because it contains both *Vetus Latina* and Vulgate readings) of the Gospels brought by the early missionaries from Rome to Canterbury. Northumbria from an early date was home to a pure Italian text of the Vulgate Gospels that is represented in the Codex Amiatinus, and the Lindisfarne Gospels, as well as in a manuscript of Stonyhurst College, Lancashire (unnumbered, on deposit at the BL), which contains the Gospel of John. Also present in northern England, due to Irish missionary activity, was the Irish family of Gospels, in which both the Vulgate and the mixed Italian type are represented: the manuscripts include the Book of Kells, the Gospels of St. Chad (Lichfield, Cathedral Library Lich 1), and the Rushworth Gospels (Bodl. Auctarium D.2.19). It has often been suggested that Alcuin turned to the English Bibles for his revision of the Gospels, although the exact links are still unclear.

In addition to manuscripts of the Bible and biblical materials used in the liturgy, the Anglo-Saxons had two other major sources for biblical lore: biblical commentaries (and homilies) and metrical paraphrases of the Bible. Commentaries by the four main Fathers of the Church, Ambrose, Augustine, Jerome, and Gregory, as well as by many others, survive in manuscripts from the period; Bede did much to perpetuate this tradition. Alcuin provides a good example of the knowledge of biblical epic. In his description of the books that Ælberht, archbishop of York, left to him he includes Caelius Sedulius, Juvenius, Avitus, Prudentius, and Arator, all of whom he used in his *Poem on the Bishops, Kings, and Saints of York*. Most of these authors continued to be copied in the later period.

What did Anglo-Saxon vernacular writers do with this biblical material? They glossed, translated, and paraphrased it and used it for themes and images

in prose and poetry. The Psalms and the Gospels deserve particular attention. The Vespasian Psalter contains a continuous vernacular gloss in a mid-9th-century hand, and there are some 9th-century glosses in the Morgan Psalter. The 9th-century gloss in the Junius Psalter may be in the same hand as the Latin, and that in the Regius Psalter from the same date as the Latin, mid-10th century. The Paris Psalter (Paris, BN lat. 8824) is noteworthy because in addition to presenting the Roman version of the Psalms in one column it contains OE translations in a second column, of which Psalms 51–150 are in verse. A metrical version of Psalm 50 also survives in BL Cotton Vespasian D.vi. With respect to the Gospels Cuthbert relates that in his final days Bede was translating John into English, but this work has never been identified. The most important early glosses are in the Lindisfarne and Rushworth Gospels and date to the 10th century. A translation was also made into West Saxon, which survives in six manuscripts. In addition to the Psalms and the Gospels a prose translation, partly by Ælfric, of the first six books—known as the Hexateuch—of the Bible survives in a number of manuscripts including one that is illustrated (BL Cotton Claudius B.iv). Ælfric provided summaries of Judges, Kings, Esther, Judith, and Maccabees as well.

Perhaps the most famous collection of OE biblical material is in the Junius Manuscript (Bodl. Junius 11), which contains versions of Genesis, Exodus, and Daniel. Earlier scholars associated these poems with Cædmon, who according to Bede used to turn “whatever he learned from holy scriptures... into extremely delightful and moving poetry, in English”; but this connection is no longer held. The poems differ markedly in their use of the Bible: *Genesis A*, for example, remains relatively close to the Latin, whereas *Exodus* is much freer in its retelling of events. The *Beowulf-manuscript* (BL Cotton Vitellius A.xv) contains a fragment of a poetic rendering of Judith; and *Andreas* in the Vercelli Book is based on the apocryphal acts of St. Andrew. Biblical echoes and themes have been noted in these and many other OE texts.

Bishops

Bishops in the romanized Britain of the 4th century fit into the province's civil and administrative divisions and what remained of its urban base. By the 5th century the few surviving churches and their leaders, in the north and west, were associated with tribes, not territories. Augustine of Canterbury's mission from Rome in 597 aimed to establish 26 bishoprics, with fixed seats and boundaries and administrative responsibilities. This contrasted with a bishop's

more personal liturgical and evangelical role in the Celtic church. Eventually the Roman model won.

Augustine's foundation of sees at London (601) and Rochester (604) was a move that fully recognized the strength of Anglo-Saxon political units and their boundaries. Theodore of Tarsus, archbishop of Canterbury (d. 690), brought the number of sees to about fifteen, aligning them with centers of population and communication, while sensibly accepting political determinants and eschewing inappropriate urban models used elsewhere in Christendom. The much-traveled St. Wilfrid (d. 709) was an exemplar for the many rumbustious, political prelates of the Middle Ages, at ease with wealth and kings, in exile when not. Bishops and kings declared each other's legitimacy and power; they needed each other. Most could reconcile sincerity and expediency; for example, the 10th-century legion of well-born saints (Dunstan, Oswald, and Æthelwold) spread reformation and Wessex dynasticism hand in hand. The late Anglo-Saxon church was neither isolated nor threadbare.

William the Conqueror replaced eight bishops with Norman monks, for political as much as moral reasons. While the two metropolitans at Canterbury and York contested each other's status and jurisdiction down to the 14th century, their fifteen English and four Welsh suffragan dioceses had settled down by the 12th century. The dioceses varied widely in wealth, size, and population. By continental standards most were both rich and large. Lincoln sprawled half the length of England; Winchester was at times the wealthiest see in western Christendom; Durham enjoyed great jurisdictions on the northern border. However, the Welsh dioceses were nearly all impoverished and fragile. Sheer size made most bishops' tasks more administrative than pastoral.

Kings always wanted to influence appointments; to remunerate servants, to ensure the loyalty of such powerful lordships, to encourage the health of church life and administration, and not infrequently to enhance a scholar or holy man. If nepotism was rife, it was not widely regarded as a sin and was probably no worse or better in effects than any other system of advancement. Royal influence was contested to crisis point by such archbishops of Canterbury as St. Anselm (d. 1109), St. Thomas Becket (d. 1170), and Robert Winchelsey (d. 1313). They won fame; more good came from tough but cooperative primates, such as Lanfranc (d. 1089), John Pecham (d. 1290), and Thomas Arundel (d. 1414). Royal yesmen imposed on the church, like Walter Reynolds (d. 1327), Henry Chichele (d. 1443), or Thomas Cranmer (d. 1556), did no one much good.

In any period the ranks of bishops included monks, scholars, magnates, and civil servants. Monks and scholars eventually faded out, partly jostled by

careerist administrators, mainly because fewer such men of distinction existed. Perhaps 13th-century bishops achieved the greatest direct impact on the lives of parish clergy and people. Thereafter there was efficiency but less innovation and drive and little international or intellectual impact under generations of high-powered civil servants and lawyers. Episcopal absenteeism from dioceses can be hugely exaggerated (except in Wales).

Some men were certainly distracted by royal office, by attendance in the House of Lords, and by diplomacy, but most worked hard in their dioceses. Like many others the peerless William of Wykeham (Winchester; d. 1404) and Thomas Langley (Durham; d. 1437) served church and king with equal devotion. The episcopate never became time servers or shirkers. The Reformation of the 16th century was no fault of theirs, not even of that infamous scapegoat, the great if flawed Cardinal Thomas Wolsey (d. 1530). They coped as well as could be expected with the unparalleled and unprecedented crisis of loyalties, and with spirit, and ensured the survival of their authority into the next era.

Black Death

Everything about the Black Death is controversial. Nobody called it by that name in the Middle Ages; it was known simply as the pestilence. Its symptoms are well attested by contemporaries, particularly the swollen lymphatic glands in groin and armpit and the dark blotches caused by bleeding under the skin. These are certainly the symptoms of bubonic plague. But they also fit other diseases; there are good reasons for querying established beliefs about the nature of the Black Death.

Black rats are the most efficient carriers of the bacillus of bubonic plague because the fleas that live in their fur then spread it. But black rats are sedentary creatures, reluctant to migrate and repelled by the cool environment of the temperate-zone English countryside in which the pestilence raged. Bubonic plague transfers from animal to human hosts, either when the animal dies of plague and its fleas cannot find another suitable animal host or when the fleas themselves become so infected with plague that their stomachs can no longer receive the food their appetites tell them they need. In desperation they then turn to any available host, including human beings.

All this means that we must look for substantial concentrations of rats and a high mortality rate among rats before we can expect to find anything approaching an epidemic of bubonic plague in human populations. Contemporaries, however, never commented upon the size of the rat population. Nor did they speak of a profusion of dead rats. Instead they all agreed that the pestilence spread rapidly, far and wide, a thing that bubonic plague never seems to have done in more recent times.

The pestilence was first noted on the south coast in the summer of 1348. It was soon everywhere; it proved to be a formidable killer. Manorial court rolls, which recorded the deaths of servile tenants because a fine ("heriot") had to be paid on their behalf when they died, are full of heriot payments at this time. The bishops' registers, recording vacancies and fresh appointments made when rectors and vicars changed jobs or died, are full of new institutions to livings. Everyone naturally panicked. Parliament could not meet. The central law courts closed down.

Then, by 1350, it was all over. We hear no more about pestilence until 1361. This unparalleled scourge had utterly failed to make itself endemic. The economy made a complete recovery. On the land vacant tenancies were filled. More wool was exported in the 1350s than in any other decade, bar one, since records began, a sure sign that sheep were not susceptible to whatever it was that killed people. Cloth exports started their long climb. Meanwhile the political world woke up, renewed the Hundred Years War, and fought it to a

glorious climax in the Treaty of Brétigny (1360).

That, however, was not the end of pestilence. It returned in 1361, again in 1368, and again in 1375. By then pestilence had become recurrent, and it is difficult to pick out years of outstanding virulence. Once it became recurrent, pestilence began to reduce the population to the point at which shortage of labor was reflected in real wages.

When the pestilence arrived in mid-century, money wages jumped. The king reacted at once. He forbade all wage earners to ask for more money than they had earned in 1346. He did not have to forbid manorial tenants to ask for improvements in their terms of tenure and service because the manorial courts, which controlled so much of their lives, were well able to discipline tenants in the interests of manorial lords. When parliament reconvened in 1351, it turned the king's ordinance into statute law and established courts specifically for the adjudication of wage law.

At first these courts had very little to do, because the prices of ordinary goods rose when wages rose and seem to have risen as fast as they did. The 1350s and 1360s were in fact decades of inflation such as the economic system had not witnessed before. If the population fell as a result of the pestilence of 1348–50, it did not fall far enough to upset the balance between wages and what wages could buy. Accordingly landlords who were asked for higher wages were content, on the whole, to pay them because prices had risen enough to absorb their extra costs.

Later things changed. Pestilence became endemic and prices fell. Both these things happened in the 1370s. And when prices fell money wages did not. This was one sign that population had fallen far enough, as a result of recurrent pestilence, to produce a surplus of land. Wherever there is a surplus of land in nonindustrialized societies, real wages rise because land surplus encourages men and women to take advantage of low rents to become tenant farmers. If anyone wants a wage laborer, in such circumstances, he can only tempt him away from farming for himself by offering him a premium for his labor, as happened in Australia, New Zealand, and Canada in the 19th century, as well as in the sugar islands of the West Indies, where cheap land created labor problems for ex-slave-owning sugar farmers who could not attract labor without offering higher wages than they thought they could afford. It was certainly what happened in late-14th-century England.

The other sign that population had fallen decisively was the disintegration of the system of demesne farming that had been a feature of the countryside for centuries. Caught between rising labor costs and falling receipts, the big demesne farmers, both lay and ecclesiastical, reacted in two ways. They began to enforce the law about wages with a will; and this, as much as anything, provoked the Peasants' Revolt of 1381. And they switched from arable farming,

which required a great deal of labor, to pasture farming, which did not. Neither of these expedients solved their problems, and in the end they were forced to lease out their demesne farms when they could.

Though pestilence may have emptied the countryside, it did not make the farms that survived less productive. Indeed it probably made them more productive. Cheap land had two main consequences for farming. It enabled farmers to concentrate their efforts on the better soils and graze increasing numbers of animals; and before the age of artificial fertilizers nothing improved soil productivity more than dung. It also enabled farmers and those who worked with them and for them to live better than they had been able to do in the past. This raised farm productivity by increasing the stamina and energy with which farmwork could be done.

It is often contended that pestilence cast a pall over life in the later Middle Ages. But death had always been close, and, for many, want had made life such a lingering misery that death came as a friend. Pestilence raised mortality rates, but high mortality rates made possible higher standards of living for everyone who did not belong to the classes that had always enjoyed enough food and shelter for health. For a brief period, perhaps for less than a century, pestilence changed the meaning of the word poverty; starvation, lack of shelter, and the deficiency diseases that go with grinding poverty were banished from the common experience of life for many ordinary people, perhaps for a substantial majority of them. As time passed, the pestilence gradually lost its potency; as it did so, the population stabilized and then slowly recovered. The pace of recovery is hard to measure, but by the early 16th century real wages once more started to fall and the bulk of the population began to return to those distressing conditions of life from which the pestilence had rescued those who were not its victims.

Blickling Homilies

The second-largest collection of anonymous vernacular homilies extant from Anglo-Saxon England, after the Vercelli Book, and one of the oldest collections of Christian sermons in a western European vernacular language. One of the homilies in the collection contains a reference that can be taken to refer to the writing of the manuscript in the year 971. The manuscript of the Blickling Homilies is now Princeton, Scheide Library 71. The homilies take their name from Blickling Hall in Norfolk, the seat of the marquess of Lothian, in whose library the manuscript remained for almost 200 years.

The origin of the codex is unknown, but studies of the vocabulary have suggested an Anglian origin. The margins of the manuscript and added folios contain records of the city of Lincoln, where it was used as an oath book. In 1724 the manuscript was given by Lincoln city officials, along with the Blickling Psalter (now New York, Pierpont Morgan Library 776), to William Pownall, who later sold both manuscripts to Richard Ellys of Nocton, Lincolnshire, an ancestor of the marquess of Lothian. The 11th marquess sold the manuscripts in 1932 to pay death duties; the Blickling Homilies were acquired by Cortlandt Field Bishop and subsequently by the Scheide family, then of Titusville, Pennsylvania, in 1938.

The manuscript is the work of two scribes and comprises eighteen homilies that mainly follow the order of the church year. Surviving signatures and the contents of the manuscript reveal that four gatherings are missing from the beginning and one from the end and possibly others from the middle of the codex. The first homily begins imperfectly but is probably for the Feast of the Annunciation. The second is for Quinquagesima; the third, fourth, fifth, and sixth homilies, for later Sundays in Lent. The seventh homily is for Easter. The eighth, ninth, and tenth homilies are for the three Rogation Days. Ascension Day is the occasion of the eleventh homily, and Pentecost, the twelfth. The remaining homilies represent fixed feasts in the Sanctorale (the liturgies in honor of saints): the Assumption of the Virgin Mary (15 August), the Nativity of St. John the Baptist (24 June), Sts. Peter and Paul (29 June), St. Michael (29 September), St. Martin (11 November), and St. Andrew (30 November).

The homilies are mainly not exegetical in nature; for the most part they do not explain the Gospel reading or the lives of the saints whose feasts are celebrated. Rather, they usually offer basic instruction on the fundamentals of

the Christian faith, though whether for a lay or monastic audience is unclear.

Boethius, Anicius Manlius Severinus (ca. 480–ca. 525)

Philosopher and theologian. Boethius was born into the wealthy and privileged Italian senatorial class that was the inheritor of Roman aristocracy and the forerunner of the medieval feudal lords. After his father's death, while still a boy, he was taken into the household of the Christian Quintus Aurelius Memmius Symmachus, one of the most influential and respected members of the senatorial class, a man well able to foster Boethius's education and career, of whom Boethius always wrote with affection and respect, and whose daughter Rusticiana he subsequently married.

Like his father and his patron Symmachus before him Boethius rose to the rank of consul (510), the highest honor available to a lay citizen of the empire. He reached the peak of his public career in 522, when his two sons were named consuls and he himself became “Master of the Offices” (*magister officiorum*), a powerful chief of staff to King Theodoric for the administration of the western empire. But this post was his ultimate undoing. He became somehow entangled in the political jockeying between the ailing and aging Theodoric in the West and the ambitious Justin, emperor in the East (Boethius gives his own account of this in the first book of the *Consolation*). In late 523 or early 524 he was accused of treason by Theodoric, imprisoned at Pavia, and subsequently executed, apparently after torture (ca. 525).

Although his execution by Theodoric led to his later being considered a Christian martyr, Boethius’s chief importance lies in his preserving for the Latin West much of the Greek culture and learning of his age. He was not an original thinker; he was a translator, commentator, and adapter. Encouraged by the interests of his patron Symmachus, adept at Greek, and thoroughly conversant with the then prestigious Neoplatonic schools of Alexandria and Athens, he had absorbed and understood their teaching and educational programs. He composed works on mathematics, logic, and theology and wrote the *De consolazione philosophiae*, or *Consolation of Philosophy*.

Of his mathematical works the *Arithmetic* (*De institutione arithmetica*) and the *Music* (*De institutione musica*) survive more or less complete, and there are substantial traces of his translation of Euclid’s *Elements*. A work on astronomy was attributed to him but has not survived. These four disciplines, which constituted what Boethius named the “quadrivium,” were regarded as a fourfold bridge between the physical world of sensation and “intellectual” understanding because they trained the mind in the abstractions of number and proportion, thus preparing it for the higher study of philosophy and theology.

The Neoplatonic schools of Boethius’s era combined Aristotelian logic with Platonic metaphysics and “theology” (questions of God, Providence, and evil). Boethius, clearly concerned to provide the Latin West with this logical tradition, translated Aristotle’s logical works (the *Organon*) and Porphyry’s *Isagoge* (*Introduction*) to them. He also wrote commentaries that survive on Porphyry’s *Isagoge*, on Aristotle’s *Categories* and *On Interpretation*, and on Cicero’s *Topics*, as well as three treatises on the syllogism, one *On Division* and one *On Topical Differences*.

His theological works are five treatises, the *Opuscula sacra*. The fourth of these (named *De fide catholica* in the Middle Ages) is a survey of the whole range of beliefs concerning God and the course of salvation history; much influenced by Augustine, it offers a description of what Boethius understood to

be authentic “catholic” (universal) Christianity. The other treatises use Aristotelian logic, from within the framework of Neoplatonic philosophy, in an effort to disentangle some of the terminological problems that beset discussions of how Christ can be both God and man and how the Trinity can be both one and three. Although scholars have debated whether Boethius was the author of some of these treatises, the authenticity of all five is now generally accepted.

His masterpiece, the *Consolation of Philosophy*, is his most original work and the one that achieved widest circulation. Apparently writing in prison toward the end of his life, Boethius casts the work as a dialogue between Lady Philosophy and himself. Beginning with his desperate situation, combining classical poetic tradition and Neoplatonic philosophy in a way consonant with Christianity, Philosophy leads Boethius and the reader, in alternating “meters” and “proses” (passages of verse and prose), through the problems of Fortune, Fate, evil, and free will toward the ultimate Good.

Boethius’s contemporary Cassiodorus knew of his theological writings, mentioned his mathematical works, recommended two of his logical commentaries, and used two of his logical translations. But, as often with early-medieval secular texts, evidence that Boethius’s works circulated widely begins to appear only in the Carolingian renaissance (late 8th and early 9th centuries). The *Arithmetic*, *Music*, adaptations of his translation of Euclid, the *Opuscula sacra*, and the *Consolation of Philosophy* all became standard school texts around which medieval commentaries grew up. Of the logical works Boethius’s translations of and commentaries on the more basic parts of Aristotle’s *Organon* (the *Isagoge*, the *Categories*, and *On Interpretation*) were much used in the study of the “old logic.” His work on Aristotle’s more advanced logical subjects fell out of use, and these had to be replaced in the 12th century by fresh translations and commentaries (the “new logic”).

Boethius in the Anglo-Saxon Period

The entire range of Boethius’s work had at least some circulation in Anglo-Saxon England. Alcuin names Boethius as among the authors in York’s library of the late 8th century. Several copies of the *Arithmetic* and *Music* written in late-10th or early-11th-century England survive, along with a version of the Euclidean translation and a copy of the *Opuscula sacra*; surviving library catalogs of the same period mention some of the logical works (translations of or commentaries on the *Isagoge*, the *Categories*, and *On Interpretation*). But the best known of Boethius’s works in England before the Norman Conquest

was clearly the *Consolation*. King Alfred translated it (ca. 892) as one of those books “most necessary to know,” adapting it in the process to his own christianized Germanic culture just as deftly as Boethius had originally adapted classical and Neoplatonic strains to his own Latin Christianity. And sixteen copies of Boethius’s Latin text made in 10th- to 11th-century England, all but one with commentary, show that it was a standard text much read in the monastic schools.

Boethius in the Middle English Period

In the ME period Boethius was among the most influential of the late-antique authors. Several of his compositions, including the *Arithmetic* and his translations of and commentaries on Aristotle’s works, were standard university texts. His *Opuscula sacra* were also well known, and so in the universities he served the causes of both philosophy and theology. His most influential work, however, remained the *Consolation of Philosophy*.

Two complete translations of the *Consolation* were written in ME. Chaucer’s *Boece* (ca. 1380) is in prose and draws on Jean de Meun’s Old French translation, the commentaries of Nicholas Trevet and Remigius of Auxerre, and a distinctive late-medieval version of the original Latin text known as the Vulgate version. John Walton’s verse translation (1410) is based on the Boece and Trevet’s commentary. Both translations were popular by medieval standards; there are ten extant manuscripts or fragments of the *Boece* (together with editions by Caxton and Thynne, each of which utilized a no longer extant manuscript) and over 25 of Walton’s translation. Both also indicate the vital and changing nature of the *Consolation* in the ME period: Boethius’s text was understood to include not simply the Latin original but also a variety of interpretive materials.

The ideas and images of the *Consolation* were influential in various ways. Thus Chaucer relied heavily on the *Consolation* in both the *Knight’s Tale* and *Troilus and Criseyde*. The intellectual world of the *Knights Tale*, as summarized by Theseus’s distillation of book 2, meter 8, and book 4, prose 6, realizes the greatest potential of pre-Christian thought; and Troilus’s despairing soliloquy on the futility of volition (*Tr* 4.958–1082) draws on proses 2 and 3 of book 5 of the *Consolation*, though it does not contain, significantly, the answers that Lady Philosophy provides to the sorts of questions Troilus raises. Chaucer also employed the ideas of the *Consolation* in a number of the *Canterbury Tales* and in his Boethian ballades. The larger *Consolation* tradition is reflected in a work like Robert Henryson’s *Orpheus and Eurydice*,

which draws on Trevet's interpretation of meter 12 of book 3.

Boethius's image of Fortune's wheel had particularly wide currency in ME. It occurs throughout Gower's *Confessio Amantis*, for instance, and is a thematic focus in both the *Kingis Quair* (where the dreamer's waking as the wheel ascends implies success in love for him) and the alliterative *Morte Arthure* (where Arthur's fall from the wheel as it descends presages his doom). This image became so pervasive in ME writings that it occurs in contexts where the connection with the *Consolation* is neither clear nor relevant; thus in William Dunbar's "Birth of Antechrist," Dame Fortune's explanation of the nature of the wheel introduces the burlesque account of one John Damian, who attempted to circumvent inevitable descent by contriving to fly.

The structure of Boethius's work—a dialogue designed to achieve consolation—was influential as well, especially in works like *Pearl* and the *Confessio Amantis*, wherein the protagonists are reconciled to their situations through the advice of supernatural characters. Given the importance of Boethius's thought in general in the Middle Ages, however, much of the *Consolations* influence may have come not directly or indirectly from the work itself but from other, equally influential texts that utilize Boethius's ideas—e.g., the *Divine Comedy* and the *Roman de la Rose*.

Bokenham, Osbern (1392/93–after 1463)

Augustinian friar, poet, and translator, born possibly in Norfolk. Bokenham's works include the prose *Mappula Angliae* (early 1440s), which translates part of Ranulf Higden's *Polychronicon*, and the *Legends of Holy Women* (1443–47), thirteen saints' lives in various verse forms and the first all-female hagiography in English. The legends show skill and innovation in the genre, as well as familiarity with Chaucer's works and with saints' lives by Capgrave and Lydgate. Bokenham claims (in the *Mappula*) to have translated the

Legenda aurea; whether this translation is the extant *Gilte Legende* (1438) is debated among scholars. A translation (1445) of Claudian's *De consulatu Stilichonis* and the "Dialogue" (1456) displaying the royal descent of Richard of York have also been attributed to Bokenham.

Bokenham studied at Cambridge University; he is described as "doctor of divinity" in the manuscript of the *Leg ends of Holy Women*. By 1446 he had traveled to Italy at least twice and made pilgrimage to Compostela in Spain. Among his patrons for the *Legends* Bokenham praises Isabel, Lady Bouchier, sister to Richard duke of York, who in 1460 claimed the throne against Henry VI. Most of Bokenham's life was spent at Clare Priory in East Anglia, the oldest Augustinian establishment in England, where he officiated as vicar general for provincial chapter meetings in 1461 and 1463. A "master Osbern of Clare" is designated as a beneficiary in the 1463 will (probated 1467) of John Baret, an important merchant in Bury St. Edmunds; that Osbern's name was not removed before probate suggests that he survived until at least 1467.

Boniface (ca. 675–754)

Churchman and missionary. Born as Wynfrith in Wessex, he was trained at Exeter and then at Nursling. After an unsuccessful mission in Frisia (in the Low Countries) he journeyed to Rome, where he gained a formal mandate from Pope Gregory II for his missionary endeavors and took the name of Bonifatius (719). Returning via the Rhine, he worked with Willibrord from 719 to 721 in Frisia and was consecrated bishop without episcopal seat (722) after a second visit to Rome. With the protection of Charles Martel, ruler of the Franks (d. 741), he labored in Germany (723–35), beginning with the felling of the sacred Donar Oak at Geismar. Under Pope Gregory III he was made archbishop (732).

On a final trip to Rome (737–38) the organization of a Bavarian church was planned and the country subsequently divided into four dioceses, based on existing political units. Dioceses were also established in Hesse, Thuringia, and Franconia (741). Inspired by Boniface, a series of synods, supported by Carloman and Pippin, the successors to Charles Martel, met from 742 (or 743) to restore canonical order to the Frankish church. In a synod of 745 the Franks decided to set up four provinces including one under Boniface in Cologne. However, plans were eventually abandoned, following opposition by the Frankish episcopate, and Boniface had to settle instead for the see of Mainz. In 753 he handed his duties and offices over to his disciple Lul and returned to Frisia to preach to the heathen. Killed by brigands at Dokkum on 5 June 754, he was buried at Fulda, an abbey he had founded in 744.

Boniface's greatest achievement lies in his initiation of the reform and organization of the Frankish church, without which further missionary work could not have been sustained. His correspondence supplements his biography by Willibald (written 754–68) and provides insight into his life and work.

Books and the Book Trade

From the early Middle Ages until the 12th century the responsibility for the production and preservation of manuscripts, in England as on the Continent, fell upon the monasteries. They created scriptoria, in which monks copied and illuminated manuscripts, and libraries, in which manuscript collections were housed. Manuscripts were on parchment or vellum, materials readily available owing to the vast number of sheep, and were bound in leather. The language was almost exclusively Latin. Many manuscripts, such as the Lindisfarne Gospels, were beautifully decorated works of art. Manuscript books tended to be large, suitable for placement on a lectern so they could be read aloud to a monastic audience. Monastic book collections frequently included the scriptures, the Church Fathers, Latin classics, and secular works on history, philosophy, law, medicine, and astronomy.

Much of the monastic book trade was internal, involving the creation of manuscripts for and the exchange of books among monasteries. English monarchs often requested or purchased books from established monasteries to aid newly created ones. In addition monasteries sent men to the Continent to acquire new manuscripts for their collections. There was also a small-scale external trade through which the laity could purchase books. Books were still relatively rare and often just lumped together with other precious objects.

The expansion of schools in the 11th and 12th centuries produced a tremendous upsurge in the demand for books as texts for the new scholarly population. Books created for this audience tended to be smaller, as appropriate for private study. Manuscript production centered in urban abbeys, such as St. Frideswide and Osney in Oxford. University stationers were commissioned to arrange the copying, decorating, and binding of books for university students. They also participated in the growing secondhand book trade. Although subject to some control from the universities, they operated with fewer restrictions than counterparts at Paris. To serve the large number of customers stationers frequently resorted to the *pecia* system; sections of books were rented out for students and scholars to copy for personal use.

By the later Middle Ages the growth of a literate laity including merchants, civil servants, and gentry—women as well as men—resulted in a thriving commercial market for book production. They frequently appeared as bequests in wills or as security for loans. Books for this market were produced in the vernacular, generally in a readable business script. Until the advent of printing

new manuscripts were produced on commission for a specific customer. Secondhand books were often carried by traveling peddlers or sold at the great fairs: Stourbridge near Cambridge, St. Giles near Oxford, St. Bartholomew's in London. Books were imported from the Continent as well.

The production of books in England centered in London, around St. Paul's and the Inns of Court. Producers of books were organized into guilds, as were other crafts. The most notable were the Scriveners' Company and the Stationers' Company. Stationers generally served as middlemen between the customer ordering the manuscript and the artisan who created it, although stationers might also participate in other aspects of production. Manuscript book production was highly structured, involving specialized artisans working either at home or out of small shops. The cooperation of the members of several crafts was required: parchmeners to prepare writing materials, copyists to create the text, illuminators to decorate margins and provide illustrations, bookbinders to bind the whole. Increased demand led to more efficient and less costly methods. Illustrations were often block-printed; paper, imported from France and Italy, replaced expensive parchment. Paper was the medium of choice as printing entered England.

England's first printer-publisher, William Caxton, was a native-born Englishman who learned his trade in Cologne and Bruges. Returning in 1476, he opened a movable-type print shop in Westminster. Since the Continent adequately supplied Latin and French books for the English market, he specialized in original texts and translation into English. His 100 or so printed works included romances, poetry, history, and, most notably, the *Canterbury Tales* and had a wide appeal to an expanding secular audience. He also imported books from abroad, serving as the first English retailer of printed books in a field dominated, even in England, by the French, Germans, and Dutch. Caxton's successor, Wynkyn de Worde, was actually a native of Lorraine. It was not until the mid-16th century that the English would come to dominate their own book trade.

Books of Hours

Fig. 28. Book of hours (BL Yates Thompson 13), fol. 139, ca. 1330–40. Opening to the beginning of Gradual Psalms: crowned woman introduced to Christ by Virgin; condemnation of the damned. Reproduced by permission of the British Library, London.

To the well-off layperson of the later Middle Ages a book of hours (figs. 28–29)

was a much-prized possession, both as a sign of wealth and as an essential guide to devotional life. The book of hours set out the pattern of the devotional day, in imitation of the daily routine of the divine office followed by the monks and clergy, praying at eight times of the day from Matins (just after midnight) to Compline (before bed): the liturgical hours. This program of devotions—psalms, hymns, lessons, and prayers—as it was interpreted, chiefly for the laity, in the book of hours, was easy to follow, and the texts were chosen with a specific devotional focus.

The primary focus was always the Virgin Mary, through the hours dedicated to her honor—the essential text of the book of hours—and other devotional sequences and prayers. Often hours services were included that focused on the mysteries of the Passion, on supplication to the Holy Spirit and the Trinity, and even on hours dedicated to specific saints. The constant need for penance was satisfied by the sequence of Penitential Psalms, and the Prayer for the Dead was set securely through the complex Office of the Dead and the commendations. Usually the book of hours would frame the liturgical year within a calendar of feasts, graded according to their importance both to the universal church and to local and personal cults. The pattern of devotional life, as laid out in the book of hours, followed the liturgical hours through the day but offered the devout endless scope for devotional accretions. The variety found in these books—both of formal texts and of personal prayers and devotional practices—illustrates the lively participation of the laity in the celebration of their religion.

In England the first books of hours date to the second quarter of the 13th century (earlier, in fact, than in France or Flanders), and they grew in popularity during the 14th century. In England psalters continued to be valued by the laity, as was the hybrid psalter-hours, although by the end of the 14th century in both France and Flanders books of hours had become ubiquitous. Produced in considerable numbers, both as “stock” models and adapted to the request of a patron as a “custom-made” volume, their popularity throughout Europe attests to a common devotional style; it also demonstrates the increasing literacy of the laity and their ability to pay for an expensive, if not necessarily a luxury, object. By the 15th century the English market for books of hours was supplemented by many foreign imports from the major continental workshops, the manuscripts carefully modified to accommodate the English liturgical and hagiographic traditions.

Fig. 29. Book of hours (BL Harley 6563), fol. 60, ca. 1330. Fox and hole marginalia. Reproduced by permission of the British Library, London.

Essentially a personal possession, more than most medieval books, the book of hours could respond flexibly to the requirements of its owner. Sometimes

this personal quality was present at the design stage, with scribe and illuminator working to the instruction of the patron. But often a book of hours shows the personal stamp of a new owner: coats of arms modified, prayers added, inscriptions and obits inserted. Such updating bears witness to the continuity of use across generations, and the stability of the lay devotional life until the injunctions of Edward VI ordered the end of their use and the destruction of the manuscripts.

The selection and arrangement of the decoration and illustration in the most elaborate and finely illuminated manuscripts also provided scope for the personalization of a book of hours. Right from the start books of hours were illuminated, with a program of illustration that supplemented the devotional themes of the text. The primary importance of the Virgin Mary was reflected in the constant illustration of the Virgin enthroned with the Christ Child, and the narrative series of images of his infancy, during which her role as mother was developed. These images, accompanied by prayers of praise, were interwoven to enhance the devotional impact. Similarly imagery focusing on the events of the Passion followed the passage of the liturgical day in step with Christ's sufferings, adding a meditative layer to the hours of prayer. Single images of saints, or of the Trinity or the Holy Spirit, would supplement prayer in an iconic manner—an image to lend inspiration to prayer. And very often the illustrations of the book include a portrait of the patron of the manuscript, depicted at prayer, as a constant example of the good Christian life through which these books guided their owners. Despite this the humorous strand of later medieval illumination ran riot in the pages of some books of hours (figs. 93, 94: see Marginalia). Usually in the freedom of the borders around the text, animals, monstrous hybrids, images from courtly romances, and sermon exempla all abound. In the *bas-de-page* spaces below the text, the sports of the lady owner of the Taymouth Hours (BL Yates Thompson 13; ca. 1340) are portrayed, together with the grisly tale of Bevis of Hampton and the many and various torments of hell.

The developing styles of English illumination are reflected in these books. The first example surviving from England—the de Brailes Hours, dating to ca. 1240 (BL Add. 49999)—was evidently written and illuminated in Oxford (fig. 31: see BRAILES, WILLIAM DE). Fully illustrated, with narrative sequences of historiated initials for each section of the text, this follows the conventions of contemporary Oxford illumination, and it set the devotional scene for its original lady owner. The small format of this manuscript became a characteristic form for books of hours, with large clear script in a single column and historiated initials at the opening of the major texts. Exceptionally books of hours were made on a grander scale, following the characteristic tradition for psalters.

By the early years of the 15th century manuscripts made across the Channel for English use outnumbered those produced in England, both the inexpensive mass-produced imports and the elaborate works designed for the needs of a nobleman, such as John duke of Bedford, whose marriage in 1423 is commemorated in an elaborate Paris-made book of hours (BL Add. 18850), or Lord Hastings, whose Flemish-made hours (BL Add. 54782) dates to the end of the century. The heyday of the book of hours lasted well into the 16th century, by then supplemented by printed editions. Whether elaborately illuminated or not, the key to its success was the flexibility that could be offered within the constraints of a defined and regulated devotional life.

Boroughs

Anglo-Saxon Boroughs

Both historical and archaeological evidence shows a diversity of origin and size for settlements designated as boroughs before 1066. At all times, however, their basic role as strongholds differentiates them from other types of settlement. Some places described by the Anglo-Saxons by the OE term *burh* were in fact pre-English fortresses: Cissbury, Badbury, or Cadbury. Others were early monastic sites but presumably possessed stone buildings for protection in time of war: Malmesbury or Tetbury.

The 33 *burhs* of the Burghal Hidage included Roman towns (Winchester, Bath), Roman or Iron Age forts (Portchester, Chisbury), existing Anglo-Saxon trading or royal centers (Langport, Wilton), and new forts founded by Alfred to answer the immediate danger of the Viking threat to Wessex (Sashes, Burpham). The Alfredian *burhs* appear to have been primarily defensive in purpose, in contrast to the use of fortified sites as offensive bases by the Vikings in the Danelaw (the Five Boroughs: Derby, Leicester, Lincoln, Nottingham, and Stamford) and by Edward the Elder and Æthelflæd of Mercia in the early 10th century, in their campaigns to reconquer the Midlands (Hertford, Buckingham, Maldon, Tamworth, Warwick).

Such offensive *burhs* often became centers of royal government, their names being enshrined in their subordinate territory or shire (Hertfordshire, Derbyshire, Warwickshire). Both these offensive *burhs* and those of the Alfredian *burhs* that survived were parts of the royal demesne, under the control of a royal official or reeve. Trade and manufacturing were encouraged and they were designated as the site of mints and of officially approved markets, often described not only as *burh* but also as *port*, trading center. While tenements (*hagas*: urban dwellings) in the boroughs were often appurtenant to nearby rural estates, providing an outlet for surplus crops or raw materials, their inhabitants were subject (from at least the mid-10th century) to separate borough courts that met three times a year. The phrase *binnan burh and butan* (within the borough and without), used in royal writs, encompassed the totality of privileges, both urban and rural, granted to a beneficiary by the king.

By the 11th century the peculiarities of burghal law appear to have been propounded by “lawmen” in such boroughs as Cambridge and Stamford, while in such cities as Canterbury and Winchester, also legally classed as boroughs, associations of merchants into guilds for their mutual economic and legal support are recorded. Domesday Book shows that approximately one-tenth of the population lived in about 112 boroughs or urban settlements, varying greatly in size but sharing trading or mercantile functions to set them apart

from their rural counterparts. Many of these continued as commercial and manufacturing centers in the medieval and modern periods.

Boroughs after 1066

Though “town” and “borough” are for many purposes interchangeable, in that many medieval settlements could legitimately be described as either, “borough” by the 12th century seems to have acquired a precise technical meaning; a place with a particular status whose inhabitants held their land by a distinctive free tenure, “burgage tenure.” This is not the same as a town, for which Susan Reynolds offers a working definition: a permanent human settlement, many or most of whose inhabitants gain their living by a variety of nonagricultural occupations and which forms a social unit more or less distinct from the surrounding countryside.

By these definitions not all towns were boroughs, and not all boroughs really towns. It should also not be assumed that the Anglo-Saxon *burh* had the same characteristics as the later borough, though it is clear that *burhs* were places with distinctive customs and identities, and many of the more important towns of the post-Conquest period, including most of the county towns, are known to have existed in the 10th century or earlier.

In the post-Conquest period a new borough was almost always a deliberate creation by an overlord, either king or lay lord or churchman. The clearest evidence for borough status in this period is the charter conferring it; these become plentiful in the 12th and 13th centuries. Most of the earliest known boroughs, pre- and post-Conquest, had royal founders. The 13th century saw the largest number of new creations, along with the highest proportion of creations by nonroyal lords. Of the 609 known or conjectured medieval boroughs 80 percent were in existence by 1300. In the 14th century the rate of creation was falling off, as population growth slowed and then reversed; even before this there must have been a saturation factor and a number of new 13th-century boroughs failed to flourish.

Creating a borough usually involved laying out land in defined plots, centering on a street or open space; the holders of the plots became burgesses. Burgage tenure freed those who held by it from the personal and labor services attached to villein tenures and usually replaced them with a simple fixed rent. An essential feature of the borough was the holding of a market; some also had fairs. Borough status and the creation of new boroughs offered rewards to both lord and tenant. The incentive for the lord was clearly the hope that the grant of burghal status would initiate or stimulate the growth of a prosperous and

profitable settlement, where the concentration of population and encouragement of market exchanges would produce a return in the form of burghage rents, tolls and market dues, and the profits of the courts that dealt with commercial disputes. Borough creation, like the building of towns, can be seen as a means of restructuring and civilizing hostile or alien society; this is an important feature of Edward Is north Welsh borough creations.

The designation “borough” covers a wide range of settlement, from the county towns and cathedral cities with populations in their thousands to places that can never have been much more than large villages. Only the more prosperous towns were counted as boroughs (paying a tenth rather than a fifteenth) for taxation purposes in the later Middle Ages, and fewer than half sent members to parliament. Boroughs were unevenly distributed across the face of the realm, with the highest concentration in the southwest and the west Midlands. Distribution was not a simple correlate of wealth, since the agriculturally prosperous and well-populated Norfolk had very few boroughs, but the greater density in southern England as a whole, compared with the north, probably does reflect real economic differences. Changes in the economic fortunes of towns and regions in the later Middle Ages and early modern period, however, have tended to locate modern concentrations of population in areas where medieval boroughs were thinly spread.

Bourchier, John, Baron Berners (ca. 1467–1533)

Tudor courtier and translator. Berners participated in diplomatic missions to France and Spain in 1514, 1518, and 1520; he was made chancellor of the exchequer in 1516 and served as deputy of Calais (1520–26, 1531–33). At his death his library contained 80 volumes, a large personal collection in his day.

Berners's extant translations were made between ca. 1514 and 1533, possibly in the following order:

- *Arthur of Little Britain* (printed ca. 1555 and ca. 1582); a chivalric prose romance notable for its fantastic elements, translated from a printed version of an early-14th-century French original.
- *Huon of Bordeaux* (printed ca. 1534? and 1601; possibly also printed between 1545 and 1561, and in 1570); a prose Charlemagne romance.
- Jean Froissart's *Chronicles* (printed 1523–25 and 1545); a 14th-century chivalric history of contemporary England, France, and other countries, translated at least partly under patronage of Henry VIII.
- *The Castle of Love* (printed 1549?, 1550, and 1560); a sentimental Spanish tale attributed to Diego de San Pedro, probably known to Berners in a French version.
- *The Golden Book of Marcus Aurelius* (printed 1535; numerous reprints); a collection of moral sayings originally compiled by Antonio de Guevara (d. 1545?) in Spanish, known to Berners in French.

In his interest in chivalric romance and history and in the content of some of his prologues Berners's work as a translator appears to have been influenced by Caxton. The latter two works, however, suggest a shift to a model more in tune with 16th-century humanist literature.

Bozon, Nicholas (fl. late 13th-early 14th century)

Anglo-Norman Franciscan friar and didactic author. His works cover a wide range of verse forms and genres—allegory, poems on the Virgin, saints’ lives, proverbs, and sermons—and blend practical didacticism with a lively, down-to-earth style. The *Plainte d’Amour*, Bozon’s poetic masterpiece, satirizes ecclesiastical and secular corruption. His crowning literary achievement, the prose *Contes moralisés* (*Moralized Tales*), is a collection of 145 exempla, often followed by a moral and a supporting story on the same topic. The *Contes* grew out of the 13th- and 14th-century tradition—especially strong among the Franciscans—of compiling collections of exempla and other sermon materials for the use of preachers.

Bracton, Henry of (d. 1268)

Royal justice, ca. 1245–57. He entered the king's service, possibly as early as 1234 and certainly before 1239, when he was senior clerk of the court *coram rege* ("before the king"). His name derives from a Devonshire village, and he probably entered royal service through the patronage of a fellow Devon man, the great judge William Raleigh. An ecclesiastic, Bracton probably received his early education at Exeter; nothing is known of any advanced studies. He obtained church livings typical of clerics in royal government, being chancellor of Exeter Cathedral at the time of his death.

Bracton's fame comes from the tradition that he was author of the treatise *De legibus et consuetudinibus Angliae* (*On the Laws and Customs of England*), the most masterly work on the common law written in the Middle Ages. This authorship now appears unlikely. The latest editor of the treatise concludes that the date of writing, mostly from the 1220s or 1230s, was too early for Bracton to have written it and that it was first written by William Raleigh or under his direction, then continually revised and expanded by Bracton and others until it took its present form (ca. 1258). It suffered from the fact that it has survived only in copies with so many mistakes, omissions, and the additions of incompetent copyists and redactors that its original form can only be guessed at. This had led to scholarly speculation about the author's knowledge of Roman and canon law. Recent views depict the author as an accomplished romanist, relying on Roman legal principles to shape English

law into a coherent pattern.

Bradford

Nothing certain links this late Anglo-Saxon (ca. 1000?) church in Wiltshire with Anglo-Saxon documentary evidence; the first statement considered to refer to the surviving church dates to the early 12th century, when William of Malmesbury described an *ecclesiola* at Bradford commonly believed built by Aldhelm (d. 709/10) and dedicated to St. Laurence. Saxon sources give two additional, relevant facts: Aldhelm remained abbot of monasteries at Malmesbury, Frome, and Bradford upon his election to the bishopric of Sherborne in 705, and in 1001 Æthelred II granted the manor of Bradford and its monastery to the nuns of Shaftesbury, as refuge from the Danes and a hiding place for the bones of Edward king and martyr.

The date of the standing fabric has remained the primary controversy since its "rediscovery" about 1857, crowded by buildings and housing the school and schoolmaster. From 1874 to 1881 restoration was supervised by J.T. Irvine, a keen and accurate observer whose careful notes and illustrations were published by Taylor (1972) and provide crucial information because of the lack of subsequent archaeological excavation. Irvine resigned in 1881, disagreeing

about the destruction of the master's house on the south and the erection of buttresses; remaining restoration was done by C.S. Adye, a less reliable supervisor.

Though Gilbert has questioned whether the building is a martyrium or mausoleum, Bradford ([fig. 30](#)) is generally referred to as a church. It consists now of a chancel, a north porticus (side chamber), and a nave; originally a south porticus also existed with evidence suggesting it may have had a lower-level chamber, functioning as a crypt perhaps for Edward's remains. Though somewhat irregular in plan, the entire church rests on a plinth, and doorways survive in north and south walls of the north porticus, and to the lost south porticus, in addition to a narrow chancel arch. The existence of a west entrance is impossible to confirm, though its absence would be unusual. The exterior is ornamented on every side with pilaster strips, arcading between stringcourses, and reeded pilasters on the east gable of the nave. Levels within the church varied, with a step up to the north porticus and a step down to the chancel area. But perhaps the most famous attribute of the church is its slabs with carved angels, now high over the chancel arch. They had been found there during alterations, "imbedded"; they were later moved to the porch beside the schoolmaster's door and subsequently returned over the arch.

Fig. 30. Church of St. Laurence, Bradford-on-Avon. After E. Fernie, The Architecture of the Anglo-Saxons (1983). Drawing by C. Karkov.

Discussions over the years have generated several theories about construction phases, focusing on the date of the external arcading that

decorates the walls, the ashlar construction, the opening of single- to double-splayed windows, and the pilaster strips cut into the walls by the chipping away of the surface. While Mercer, Jackson, and Fletcher felt that several phases could be discerned in the building, Mercer contradicted Jackson and Fletcher's argument for rebuilding of an early church. Jackson and Fletcher refuted his arguments and reiterated their suggestion "that the church is in its ground-plan and lower stages the work of Aldhelm, and that the later Anglo-Saxon features are the result of a rebuilding or refacing late in the tenth century" (1966: 71). Subsequent study of Irvine's unpublished work and personal measurement of exterior and interior elevations, however, convinced Taylor that the chapel is late Anglo-Saxon, not Aldhelm's work, and overwhelmingly of one date: "as first built, the chapel had all its present features except that the windows were probably at first single-splayed" (1973: 165) and modified before the Conquest.

Brailes, William de (fl. 1230–60)

A 13th-century illuminator recorded in Oxford ca. 1230–60, de Brailes secured

his memory—among many hundreds of unnamed illuminators—through his self-portraits, three of which survive in two manuscripts. From these, accompanied by the name “*w de brail*,” his hand and his style are established. His style is found in a considerable corpus of manuscripts, some of which were evidently produced in Oxford. Documents show that in 13th-century Oxford there was an active community of book producers living in the streets surrounding St. Mary the Virgin. Among them, ca. 1230–60, was one William de Brailes. He achieved a certain prosperity, had a wife, Celena, and probably came from Brailes in Warwickshire. His identity is near certain.

Oxford in William’s time was dominated by the developing university, creating a demand for books. The variety of manuscripts illuminated by William, or by the large number of hands associated with him, would have satisfied the demands of scholars, churchmen, and laity. Characteristically his manuscripts, often pocket-sized, are illustrated with many small historiated initials, creating a visual narrative to accompany the text. Even large manuscripts or full-page images are fragmented with foliage decoration to create multiple small spaces for illustration.

Filling, even spilling over, their restricted frames, Williams figures convey the narrative with emphatic gesture, dynamic poses, and firmly focused eyes (fig. 31). Although he may use established iconography, it is filtered through his imagination and retold with new immediacy. Rarely does he use elaborate settings, although the essentials are clear—a mountain for Christ’s temptation, steps for the child Mary to climb to the Temple—and costume is equally important in identifying his characters, as in the case of crowned kings, mitred bishops (or high priests), round-hatted Jews, or heavy-horned devils. De Brailes’s style is not one of courtly elegance. It is a “literary” one, appropriate to the books of a university town.

Breton Lay

The name given to eight short ME narratives, composed between 1300 and 1425. The earliest extant poems identifying themselves as Breton *lais* are those of Marie de France, who wrote in Anglo-Norman during the second half of the 12th century. Her poems, usually set in a timeless past in Brittany or Britain, center on love problems, often with supernatural elements. Marie inspired French imitators in the 13th century, some of whom shared her stylistic and thematic concerns. In the early 14th century ME poems labeling themselves “layes of Britanye” or “Brytayne layes” began to appear. Not surprisingly two of the earliest English lays, *Sir Landeval* and *Lai le Freine*, are translations of two of Marie’s *lais*, and at least one other, *Sir Orfeo*, is thought to be based on a lost French *lai*. Later in the century the term “lay” became attached to tail-rhyme romances far removed from the French tradition. Even the famous alliterative romance *Sir Gawain and the Green Knight* calls itself a lay (line 30). Chaucer’s *Frar Mins Tale* calls itself a Breton lay (709–15), although it deriv’s mainly from Boccaccio’s *Filocolo*. Its relative narrative brevity and concern with magic provide the main connection with the lay form.

Most critics agree in assigning the generic label “Breton lay” to nine ME narratives: *Lai de Freine*: early 1300s, 340 lines (couplets), southeast or Westminster-Middlesex area; *Sir Orfeo*: early 1300s, 604 lines (couplets), southeast or Westminster-Middlesex area; *Sir Degare*: pre-1325, 1,076 lines (couplets), southwest Midlands; *Sir Launfahhxe* 1300s, 1,044 lines (12-line stanzas), southeast, written by Thomas Chestre; and its earlier couplet version, *Sir Landeval*: 1300–50, 535 lines, south; *Franklins Tale*: 1392–95, 1,624 lines

(couplets), London; *Emare*: ca. 1400, 1,035 lines (12-line stanzas), northeast; *Sir Gowther*: ca. 1400, 757 lines (12-line stanzas), northeast Midlands; *Erie of Toulouse*: 1400–25, 1,224 lines (12-line stanzas), northeast Midlands.

As a group these narratives share certain features: brevity, quickness of pace, disregard for details, emphasis on action, focus on a single hero, strong moral coloring, a lack of rhetorical ornament, and a fairy-tale atmosphere created largely by exotic settings and supernatural persons or objects. Sir Launfal has a fairy mistress; Sir Orfeo's wife is abducted by a king from a fairy kingdom; Gowther's father is a devil; Emare wears a robe made from a dazzling cloth, which characters see as magical and dangerous; in the *Franklins Tale* Aurelius hires a magician to make dangerous rocks seem to disappear.

Despite these fantastic surface features the stories center on real moral, social, and political issues of their times: feuds, false accusations, injustices, the exile of innocents, and the importance of keeping one's oath. Most of these stories also investigate serious problems within the family, such as the search for missing or exiled family members. Partly because of this emphasis on family relationships, the works are didactic, conventional, and stylized. Nonetheless, by blending the exotic and the familiar, all the lays provide appealing entertainment with an underlying moral message and can be favorably compared with the best popular literature of any time.

Bretwald

A status that features more prominently in modern works on OE history than in sources for the Anglo-Saxon period. The word appears in only one manuscript ("A," the oldest) of one annal of the Anglo-Saxon Chronicle. This records how, in 829, King Ecgberht of Wessex conquered all of England south of the Humber and was "the eighth king who was *Bretwalda*"; the reading "Bretwalda" in this manuscript is, however, the result of a scribal correction, and it is more than likely that the "Brytenwealda" of the other manuscripts constitutes the correct text. The Chronicle then lists seven who held the title earlier: Ælle of Sussex, Ceawlin of Wessex, Æthelberht of Kent, Rædwald of East Anglia, and the Northumbrian kings Edwin, Oswald, and Oswiu.

These are the seven kings said by Bede to have held *imperium* over all the "provinces" south of the Humber. A further link between the two sources is a charter of Æthelbald of Mercia (736), entitling him "king of all provinces called by the general name South England," and then "rex Britanniae." "King of Britain" is semantically equivalent with "Brytenwealda," which more probably means "Britain-ruler" than, as has often been supposed, "wideruler."

The fact that Ælle and Ceawlin are credited with major victories over Britons suggests that a *Brytenwealda* may originally have been overall leader of combined forces from early southern kingdoms. But the very word "Britain-ruler" bespeaks hyperbole, and historians, seeking to explain the eventual emergence of a united Anglo-Saxon kingdom, may well have given it more significance than they should. They see overbearing behavior by kings as institutionalized "powers" when they could be no more than evidence of simple power. In fact some powerful kings, like Æthelbald or his successor Offa, are not in the Chronicle list, implying that perceptions of a king's rights and title held by his subjects might not be shared by his enemies. The church, with its view of one "English people" (*gens Anglorum*) and its interest in political stability, may have fostered the notion. At all events, its idea, immortalized by Bede, was an eloquent testimonial to the ideology from which

one kingdom of “the English” finally emerged.

Brewing

An essential and widely practiced commercial industry. It was essential because ale, although certainly imbibed for its inebriating effects, was also a fundamental part of the medieval diet. It was widely practiced because ale was both readily made and highly perishable. Even modest peasant households possessed the utensils required to brew (pots, vats, ladles, straining cloths), and most women learned to brew as part of their domestic routine.

In many communities—both small villages and larger towns—commercial brewing was so widespread that a majority of households brewed ale for their own consumption and for sale to others. Because of its link to domestic work brewing attracted considerable female labor, and it remained an important aspect of women’s work through the Middle Ages.

Technical limitations helped ensure the ubiquity of commercial brewing. The grain used for brewing, usually oats or barley, was converted into malt by careful soaking, draining, and tending. Once the malt was dried and ground, hot water was poured over it and let stand; the “wort” drawn off from this was flavored with herbs or other seasonings. Successive mixtures produced successively weaker worts and, hence, weaker ales. Although the ale produced by medieval brewers was ready to drink within hours, the brewing process itself consumed many hours and much labor. Yet medieval ale soured within a few days and transported very poorly. As a result of these constraints on production, storage, and distribution most communities had to rely upon their own brewers for ale, and most households alternated between brewing their own and buying it from others nearby.

Throughout England both local and national customs regulated the trade of brewers. Many manors levied tolls on commercial brewers; on Alciston manor, for example, brewers had to pay a “tolcester” of 2 gallons (later amended to 1 1/2 pence) from each brewing. From at least the 12th century the Assize of Bread and Ale also regulated brewers by empowering local officials to monitor their measures, quality, and prices. The amercements, or fines, levied under the Assize eventually became a *de facto* means of licensing commercial brewers.

After the plague of 1348–49 the brewing industry began to change in two ways. First, as the market for commercial ale expanded (due primarily to urbanization and improved living standards), the brewing trade began to professionalize. In many places the once-ubiquitous business of brewing began to concentrate in the hands of a few “common brewers.” In towns brewers also began belatedly to form guilds, such as that organized by London brewers in the early 15th century. As brewing professionalized, women became less prominent. Second, the process of brewing itself changed, as brewers in England began using hops to produce a new beverage, called beer to distinguish it from unhopped ale.

Introduced from the Continent in the late 14th century, beer was cheaper to produce and more easily preserved and transported. Through the 15th century beer brewing was confined to London and coastal towns and largely controlled by foreign brewers. These were the harbingers of change; after 1500 professionalization continued apace and beer production slowly won out over ale.

Bristol

A city and port in the West Country and pioneer of cross-Atlantic trade and discovery. It lies where the Frome joins the tidal river Avon, some seven miles from the Severn estuary. The name may mean "holy place by the jetty or bridge," the second element making clear Bristols origin as a river port, the first a place perhaps associated with the meeting of St. Augustine of Canterbury and the Celtic church leaders in 603.

The early town lay on a narrow, defensible ridge between the Frome and Avon. A mint was introduced between 1017 and 1023, and a market must therefore be assumed. By 1051 Bristol ships were trading to Ireland and within 50 years with Norway "and other overseas lands." The little town was strongly defended by 1067, and its burgesses were mentioned in Domesday Book as having some independence.

A castle was built at the east end of the same ridge in the later 11th century, probably by Bishop Geoffrey of Coutances, and its huge keep, "the flower of all the keeps of England," was the work of Robert earl of Gloucester (d. 1147). The castle was the center of Empress Matildas resistance to Stephen and remained in significant royal use until the early 14th century.

Just outside the town an abbey (now Bristol Cathedral) was founded, ca. 1140; inside its walls were five parish churches and five gateway chapels, and the suburbs included a new borough beside St. James's Priory and the great southern suburb of Redcliffe and Temple Fee. By the end of the Middle Ages there may have been over 30 churches, chapels, and religious houses in and around the town.

The merchants, electing a mayor by 1216, developed their port by diverting the Frome and creating a complex of quays and docks. In the late 13th century Bristol was second only to London in its imports, in some years bringing in over three-quarters of a million gallons of wine. Near the great wool-producing areas of the Cotswolds and the Mendips, Bristol had two-thirds of

England's trade in the 14th century, exporting cloth to France and Spain and importing wine, oil, and iron. The great church of St. Mary Redcliffe was rebuilt in the 14th and 15th centuries. In 1373 Bristol's unique character was reinforced by Edward III's charter, which made the city into a county (it had stood, almost independent already, on the borders of Somerset and Gloucester). Thereafter Bristol was ruled by two sheriffs as well as by a powerful mayor.

War with France in the 15th century compelled Bristol's merchants to look for markets elsewhere. For a century they had brought exotic goods from the Mediterranean. Iceland was their first goal in the mid-15th century, and then, in 1497, a group of Bristol's merchants financed what became John Cabot's voyage of discovery to Newfoundland. Bristolians would like to believe that Richard Ameryke, sheriff of the city in Cabot's time, gave his name to the new landfall; local myths testify to the strength of local patriotism.

An Italian visitor in the late 15th century thought that Bristol ranked with London and York as the three leading cities of England. Evidence of that prosperity still survives in stone, and much more in the city's great trading traditions. The Abbey of St. Augustine was to become, at the Reformation, the cathedral church of a newly founded diocese; the church of St. Mary Redcliffe is only one of several medieval churches to be enjoyed, including the church of the hospital of St. Mark, which uniquely belongs to the Lord Mayor of the city for the time being. The rebuilding of the city after bombing in World War II has revealed much of the medieval past, including some docks and wharves and much of the castle.

Bristol Harrowing of Hell Relief

In 1832 twelve coffins were discovered beneath the floor of the chapter house of Bristol Cathedral (formerly St. Augustine's Abbey church). The Harrowing of Hell relief formed the lid of one of the coffins. Its size and shape suggested that this was its intended function, although it may also have been a work of architectural sculpture, possibly from a cemetery chapel. The relief is set deeply into the stone, the background scooped away, perhaps as a means of suggesting depth and motion—as if Christ emerges out of darkness—perhaps simply as a way of protecting the figural carving. The work is dated ca. 1050.

The monumental figure of Christ is shown trampling on the Devil, firmly bound within the beast-mouth of hell. With his right hand he blesses the tiny figures of Adam and Eve, who cling to the base of the cross carried in his left hand. The overall composition of the piece, the bound Devil, and the beast-mouth of hell, have led to comparisons with the Harrowing of Hell in the ca. 1060 Tiberius Psalter (BL Cotton Tiberius C.vi, fol. 14). This comparison may, however, have been overemphasized, as the differences between the two outnumber the similarities. The scene in the Tiberius Psalter includes far more detail; five figures emerge from the mouth of hell, Adam and Eve are clothed, Christ bends and reaches down toward them, the Cross is not present, and the folds of Christ's garment are far more decorative and complex. It is possible that these differences might be explained, at least in part, by differences in media, but they should still alert us to the fact that commonality of subject matter may not always provide sufficient grounds for comparison. In any case the meaning of both scenes is likely to be the same; the Harrowing of Hell represented Christ's victory over evil, the spiritual struggle of the individual, and his or her hope for salvation.

Brixworth

Fig. 32. All Saints, Brixworth, Northamptonshire. After E. Femie, The Architecture of the Anglo-Saxons (1983). Drawing by C. Karkov.

The large, impressive church at Brixworth (figs. 32–33) in Northamptonshire has excited the interest of architectural historians for many years. Its scale, externally ca. 150 feet long and 40 feet wide, together with the complexity of its plan and the excellence of its brickwork, demands comparison with continental churches. Excavations in 1981–82 established the contemporaneity of the choir, nave, northern series of porticus, and narthex, and the presumption from earlier excavations is that the southern porticus are of the same period. The structural homogeneity observed in the excavated foundations and the standing walls confirms the original plan as consisting of a western narthex, divided into five chambers, the central and largest chamber serving as a porch; a nave and chancel flanked by five chambers north and south that open onto the body of the church through tall arches with double rows of brick voussoirs (the wedged portions of an arch). The present eastern apse is a late rebuilding but seems to reflect the early plan. Surrounding this east end is a ring crypt with burial niches in the walls. There is also a late Saxon tower with spiral staircase that was added to the west wall of the narthex.

Fig. 33. Western tower, All Saints, Brixworth, Northamptonshire. Courtesy of C. Karkov.

The fact that this is a Roman site and that there is a documentary source noting a monastery at Brixworth by 675 has caused many to see this as a 7th-century church, closely copying late-antique models, but the square choir and

the ring crypt are closely paralleled in Carolingian architecture, and a date in the first half of the 9th century has also been discussed. Radio carbon dates for the porticus suggest a foundation of ca. 700, and it is possible that extensive repairs and renovation occurred in the 9th or 10th centuries. These included reshaping the east end to add a ring crypt and heightening the walls (which have an offset and are thicker below the clerestory windows). At the same time the area over the porch was developed to provide an upper room with a double window looking into the church. The tower, which seems to have been built from Roman stone gathered as far away as Leicester, would have been added just before the Conquest.

Brut, Prose

A legendary and (in its later sections, continuations, and additions) historical chronicle of England. The earlier, legendary material of the *Brut* is ultimately based on Geoffrey of Monmouth's *Historia regum Britanniae* (*History of the Kings of Britain*; early 12th century). It covers the period from the settling of

Britain by Brutus, the great-grandson of Aeneas, to the reign of Cadwalader. The narrative includes the stories of such kings as Leir, Coel, and especially Arthur. Subsequent material and continuations, within and without the main textual tradition, narrate the political history of England to the middle of the 15th century (in one manuscript, to 1479) and are often of great historical importance.

There is much textual variation and amalgamation with other works among individual *Brut* texts and groups of texts, and the *Manual* treats as separate works some manuscripts that the present writer considers part of the extended family of *Brut* versions and derivatives.

The *Brut* was probably the most popular secular work of late-medieval England. It survives, in whole or in part, in at least 50 Anglo-Norman manuscripts, almost 180 English manuscripts (including a few postmedieval transcripts), and about fifteen Latin manuscripts whose relationship to the Anglo-Norman and English versions is not yet fully determined. Under the title *The Chronicles of England*, or a variation thereof, the work was issued in thirteen printed editions between 1480 and 1528.

The anonymous Anglo-Norman *Bruteas* probably first composed soon after 1272, at which date several of the extant manuscripts end. Two main recensions of the work survive, the Long and the Short Versions. In the course of the 14th century the text of the Anglo-Norman work received an introduction derived from a mid-13th- to early-14th-century poem, *Des Grantz Geanz*, explaining the initial settlement of "Albion" by Albine and her sisters, and various continuations, the most popular of which are designated the long and the short continuations. These continuations brought the narrative up to 1333.

Although it continued to be copied and added to in the 15th century, the Anglo-Norman *Brut* was superseded in the late 14th century by an English translation of the Long Version with the long continuation. The translator of this Common Version (as it is called) is anonymous but probably came from Herefordshire. In the 15th century the Common Version received in its turn a number of continuations (a major one ends in 1419), usually more or less adapted from the civic chronicles of London. Two principal variants of the Common Version to 1419 were also compiled: an Extended Version, which incorporates a prologue and some details taken from literary sources, and an Abbreviated Version, which is a selective cross between the Common and Extended Versions, drawing on both but also omitting large chunks of material. Many subgroups can be distinguished within these three versions of the English text. In addition there is an amorphous, heterogeneous group of Peculiar Texts and Versions, often of historical and literary importance, consisting of individual reworkings of *Brut* texts, works based on or adapted

from the *Brut*, and combinations of the *Brut* with adaptations of other works. Some of these Peculiar Texts are linked with various Latin *Bruts*, whose precise relationships to the Anglo-Norman and English versions are still unclear.

In 1480 William Caxton published as the first printed history of England a Common Version *Brut* With, a continuation to 1461 (probably compiled by Caxton himself) under the title *The Chronicles of England*. A second translation of the basic Anglo-Norman text was made about 1435 by John Maundevyle, rector of Burnham Thorpe in Norfolk, and his translation survives wholly or in part in only two manuscripts.

To judge from its chivalric interests and from contemporary references to ownership, the *Brut* was composed originally for the landowning gentry and the nobility. As the work developed, its appeal also spread to ecclesiastics and, especially through its English translation and eventual publication, to a middle-class and mercantile audience. As a result the prose *Brut* became a standard account of British and English history, exerting a powerful influence on national historical consciousness in medieval and postmedieval England. Tudor historians and chroniclers, such as Hall, Holinshed, and Stow, used the *Brut* as a source, and its legendary history was not generally discounted until the 17th century.

Burgh, Benedict (d. 1483)

Poetic follower of John Lydgate. Burgh was educated at Oxford University and after ordination became rector of various parishes in Gloucestershire, Essex, and Suffolk from 1434 to 1460. In 1463 he was canon of Lincoln Cathedral and later held canonries and prebendaries in Colchester, Shropshire, London, and Westminster. He became chaplain to Edward IV in 1470.

One of Burgh’s few original works is a brief versified fan letter to Lydgate. After Lydgate’s death in 1449 Burgh completed the older poet’s rendering of the *Secreta secretorum*. His other major work was also a translation, this time of the *Disticha Catonis*. He probably translated the *Distichs* in the 1430s under the patronage of Henry Bourchier, earl of Essex. Like the *Secreta* Burgh’s *Distichs* seems to have been highly popular in the 15th century. There are over 30 manuscripts (and nearly 20 of the *Secreta*) and it was printed four times by Caxton.

Burghal Hidage

At the close of the 9th century the kingdom of Wessex was seeking to defend itself against Vikings who had already overthrown the English rulers of Northumbria, Mercia, and East Anglia. Central to the defense of Wessex and the subsequent recapture of much of the Midlands was a reorganization of the army, a newly founded navy, and the use of fortified strongholds or *burhs* (boroughs). The Burghal Hidage is the name given in 1897 by F.W. Maitland to an OE list of these *burhs*. This list was composed between 914 and 919, in the reign of Edward the Elder, but represents the continuation and expansion of a defensive program begun under Edward’s father, King Alfred.

It is one of the earliest administrative texts to survive from Anglo-Saxon England. Thirty-three *burhs* are named, together with the number of “hides” (a fiscal unit of land) allotted to each for its maintenance. The text survives in two variant versions (designated A and B); the A version has a section explaining how different amounts of hides were allotted to each *burh*, according to the variant circumferences of the walls and the number of men needed to repair and defend them. Thus each pole (5 1/2 yards) of wall required four men, each man being supported by one hide of land, and each furlong (one-eighth of a mile: 220 yards) of wall required 160 men/hides, and so on, according to the same formula.

The Burghal Hidage was consulted by medieval lawyers and civil servants concerned with urban rights and origins. It was subsequently copied by early-modern antiquarians for its linguistic and historical value, and more recently it has been used by archaeologists as a guide to the likely extent of urban defensive remains from the reigns of Edward the Elder and Alfred. Evidence has been found of an expansion of commercial activity in southern England centered on the more attractively located *burhs*. Those named in the list are of varying sizes and antiquity, ranging from large Roman cities to small, newly constructed forts. Where existing urban areas were used, they often seem to

have been given a new street layout on a regular plan.

In the text the *burhs* are listed in a clockwise circuit of central southern England and include places in the subordinate provinces of Sussex and Surrey and in the newly reconquered southern Midlands as well as in Wessex. Apart from those in the Midlands they were so distributed that none of the inhabitants of Wessex, Sussex, or Surrey would be more than 20 miles from a *burh*'s protection. They occur in the following order: *Eorpeburnan* (unidentified), Hastings, Lewes, Burpham, Chichester, Portchester, Southampton, Winchester, Wilton, Chisbury, Shaftesbury, Christchurch, Wareham, Bridport/Bredy, Exeter, Halwell, Lydford, Pilton/Barnstaple, Watchet, Axbridge, Lyng, Langport, Bath, Malmesbury, Cricklade, Oxford, Wallingford, Buckingham, Sashes, Eashing, Southwark, Worcester, Warwick. The modern layout of several of these places reflects both the line of the burghal walls and the associated Anglo-Saxon street plan.

Bury St. Edmunds

A major town of Suffolk, known in Saxon times as Beodrics-worth and later, after the martyred East Anglian king interred there in the early 10th century, as St. Edmundsbury. Cnut's reign (1016–35) saw a group of Benedictine monks installed to maintain the shrine, until then tended by secular clerics, and shortly thereafter work commenced on a stone church, the third such edifice to be erected on the site. Unfortunately the 11th- and 12th-century fabric survives only as ruins, though in layout and architecture the monastery probably resembled its Benedictine counterpart at Ely in Cambridgeshire.

Edward the Confessor favored the Abbey of St. Edmund with generous privileges and endowments, most notably the *sac* and *soc* (rights of local jurisdiction) of eight and a half hundreds of land in West Suffolk, as well as exemption from episcopal control. He also granted the abbot permission to establish a private mint at Bury. Thus the “liberty” of St. Edmund was remarkable both for its territorial size and compactness and for its independence from the bishop.

The Norman kings not only recognized their predecessors' grants to the abbey but added substantially to them. The abbot of Bury St. Edmunds was a powerful feudal lord with broad powers of regional administration, justice, and taxation. The sheriff's writ was inadmissible within the liberty of the eight and a half hundreds, men of the liberty were exempt from attendance at the shire court, and the abbot rendered his own account to the royal exchequer. As a result of royal favor, lay endowment, and outright purchase the abbey became one of the wealthiest monasteries in England, with estates as far away as Kent and Yorkshire. It was before the high altar of the Romanesque church that a group of barons swore on St. Edmund's Day, 20 November 1214, to exact a pledge from King John concerning their lawful rights; they were on the road that led to Magna Carta.

The townspeople of Bury benefited from the constant traffic of pilgrims to St. Edmund's shrine, though until the abbey's dissolution in 1539 attempts at self-government met with frustration. Riots aimed at wresting concessions from the abbot erupted in 1264, 1327, and 1381, all times of widespread political instability; however, the would-be usurpers never knew more than

transient success. In the late 13th century the burgesses received permission to establish a merchant guild and to nominate aldermen, but they never enjoyed the formal corporate status and privileges (e.g., electing a mayor and returning members of parliament) associated with royal boroughs.

Town-abbey relations remained strained, with crown intervention occasionally necessary to ensure the peace. Assizes were routinely held at Bury rather than at Ipswich, the shire seat, but even the king's judges were admitted to the town only at the abbot's pleasure. Based on poll tax and lay subsidy records, the town ranked among the second dozen urban communities in terms of population (ca. 4,000) and wealth. In Anselm (abbot, 1121–48), nephew of Anselm of Canterbury, and Samson (abbot, 1182–1211) the abbey possessed two exceptional leaders. The 12th century also saw the Bury workshop at the forefront of English manuscript illumination and art production, notable extant examples being the Bury Bible (Cambridge, Corpus Christi College 2) and the Suffolk Cross (New York, Metropolitan Museum of Art).

Byrhtferth (fl. 985–1011)

Priest and monk of the Abbey of Ramsey, one of the most learned Englishmen of his time, and a student of Abbo of Fleury during Abbo's visit to England in 985–87. Byrhtferth's varied literary career appears to have begun shortly after the departure of that great scholar. His works fall into three genres: computistical, hagiographical, and historical.

Computus

Computus (OE *gerim*, *gerimcræfi*) is the science of computation as it relates to the ecclesiastical calendar. The word can also be used of any collection of short texts on that science; these generally contained a calendar accompanied by tables and instructions for performing such tasks as finding the moon's age and calculating the dates of movable feasts.

The earliest of the datable works associated with Byrhtferth is a compilation of materials on computus. Of the three copies of this compilation all are incomplete, and two were evidently revised or augmented at later periods. The version that seems closest to Byrhtferth's is in Oxford, St. John's College 17, a large and elegant manuscript written around 1100 at the nearby Abbey of Thorney. This manuscript contains, among other items, several computistical works by Bede and Helperic and a computus, all accompanied by extensive marginal glosses and introduced by a Latin *Epilogus* ("preface") by Byrhtferth. Several passages in the computus and glosses date the compilation (leaving aside those items that postdate Byrhtferth) to the years 988–96. Apart from the *Epilogus* the only item in the compilation attributed to Byrhtferth is a full-page diagram (fol. 7v; [fig. 121](#); see SCIENTIFIC MANUSCRIPTS, EARLY) illustrating the harmony of the universe, and suggesting correspondences among cosmological, numerological, and physiological aspects of the world. Though other, minor items in St. John's 17 may well be by Byrhtferth, their authorship cannot be proved; nor can it be proved beyond doubt that he was responsible for the compilation as a whole. But the date of the compilation, the presence in it of the *Epilogus* and diagram, and its close association with the *Enchiridion*, discussed below, make it likely that Byrhtferth built it up from a smaller compilation left behind at Ramsey by his teacher Abbo.

Byrhtferth's *Enchiridion* (also called his *Manual*), preserved in a single manuscript, Bodl. Ashmole 328, can be dated from internal evidence to the year 1011. Written in Latin and OE, it treats a variety of subjects; however, the largest part of it is a guide to the use of the computus. The first three of the

four books of the *Enchiridion* take the student step by step through a computus evidently similar to the one in St. John's 17, introducing its tables and the calendar with explanations drawn largely from Helperic, Hrabanus Maurus, and Bede. Byrhtferth frequently digresses from the computus to touch on matters as diverse as the organization of the universe, elision of syllables in Latin verse, and rhetorical figures and diacritics. Book Four of the *Enchiridion* is a clearly presented Latin treatise on number symbolism, the fullest statement anywhere in Byrhtferth's writings of his belief that the divine order of the universe can be perceived through the study of numbers; it is also an excellent general source for the modern student interested in medieval number symbolism.

The last of Byrhtferth's works on computus is an unsigned fragment of an OE text preserved in BL Cotton Caligula A.xv, fols. 142v-143r; his authorship of the fragment is suggested by its stylistic similarity to the OE of the *Enchmdion*.

Hagiography

Two Latin saints' lives have been attributed to Byrhtferth on the basis of their stylistic affinity with the Latin of his signed works, the *Epilogus* and *Enchindion*. These works, the *Life of St. Oswald* and the *Life of St. Ecgwine*, are preserved together in a single manuscript, BL Cotton Nero E.i, a large passional to which they were added in the last half of the 11th century. Both the original passional and the additions were written at Worcester.

The *Life of St. Oswald*, written between 996 and 1005, details the career of the bishop of Worcester and archbishop of York who, with Dunstan and Æthelwold, was one of the leaders of the Benedictine Reform of the 10th century; Byrhtferth's work is considered the most important source for his life. The *Life* is also cited as a historical source for the murder of King Edward in 978 and, more famously, for the Battle of Maldon in 991. However, the *Life* tells us little about the latter two incidents that we cannot learn from other sources, and historians have at times shown impatience with its lack of circumstantial detail—forgetting, perhaps, that hagiographers, unlike chroniclers, were interested less in events themselves than in their theological significance.

The danger of using saints' lives as historical sources is perhaps nowhere better illustrated than in Byrhtferth's *Life of St. Ecgwine*, written after the year 1000, evidently at the request of the monks of Evesham, the monastery that Ecgwine, as bishop of Worcester, had founded around the beginning of the 8th century. While Byrhtferth could draw on a wealth of documentary evidence,

eyewitness report, and personal recollection in writing about St. Oswald, with Ecgwine he had no documents beyond a spurious charter and an irrelevant letter; all other evidence was filtered through some two centuries of oral tradition. It is no surprise, then, that Ecgwine emerges as an utterly conventional saint and that parallels for the incidents of his life can generally be found in the lives of other, equally conventional saints.

History

That Byrhtferth was responsible for the early sections (up to 887) of the *Historia regum* (*History of the Kings*) attributed to the 12th-century writer Simeon of Durham is suggested by the stylistic affinity of those sections with Byrhtferth's other works. Byrhtferth's work is diverse and might be better characterized as a "historical miscellany" than as a history. It contains the following sections: 1) legends of Kentish saints; 2) lists of Northumbrian kings; 3) material based mainly on Bede's *Historia abbatum*; 4) a chronicle covering the years 732–802; 5) a chronicle covering the years 849–87, based mainly on Assers *Life of King Alfred*.

Like Byrhtferth's other Latin works the *Historia regum* is written in bombastic style, much loved in the 10th century, that modern critics call "hermeneutic." Like all of his works it betrays his unusual interest in computus, in numerology, and in the figural interpretation of biblical history and the material world—sometimes introducing such topics in places that seem to us inappropriate. Indeed one of the most prominent characteristics of Byrhtferth's style is his tendency to digress suddenly, for reasons that are not always apparent at first glance.

The student should be aware that some older scholars attributed to Byrhtferth an extensive set of glosses on Bede's scientific works, a life of St. Dunstan, and two works entitled *De principiis mathematicis* and *De institutione monachorum*. More recent scholarship has shown that Byrhtferth had nothing to do with the saint's life or the glosses on Bede, and it is likely that the other two works never existed.

Cade's Rebellion

Jack Cade's rebellion in the summer of 1450 was the culmination of months of discontent in parliament and throughout the realm, coinciding with, the rapid loss of Normandy to the French. These months had seen the murder of Bishop Moleyns, the impeachment and killing of William duke of Suffolk, and a series of reforms forced upon Henry VI. The origins and early development of the rising are obscure, but by 5 June news of the rising had reached Leicester, where parliament was dissolved as the king and his nobles marched on London.

As in the Peasants' Rebellion in 1381 the center of the rebellion was in Kent. Its proximity to London and the Continent meant that news of high politics and of defeats in France made a direct impact, and its large number of free peasants and independent cloth workers helped produce a volatile community. Though primarily a rising of peasants and artisans, it is possible, as later alleged, that their action was encouraged by men of higher rank, perhaps associated with Richard duke of York. There will probably never be certainty about this. By 11 June a large force had fortified a camp at Blackheath, overlooking London. Its leader took the name of John Mortimer, presumably to signify a connection with the duke of York, then in Ireland, who represented the Mortimer claim to the throne. His real name appears to have been Cade and he was probably of low birth, though even hostile chroniclers admit that he was "witty and subtle" in his speech. He was clearly a natural leader.

There survive several versions of the rebels' manifestos. Their main theme is misgovernment, both central and local: "The law serveth of nought else in these days but for to do wrong.... [The king's] false council has lost his law, his merchandise is lost, his common people is destroyed, the sea is lost, France is lost and the king himself is so set that he may not pay for his meat and drink." Though it is clear from later indictments of rebels that there did exist radical social and religious sentiments among some Kentishmen, the manifestos do not resemble the broad social demands of 1381. Rather they sought the return of the duke of York from Ireland, the formation of a council controlled by the

great magnates, and the trial of “traitors and extortioners.”

On 18 June the rebels retreated from Blackheath, unwilling to face the advance of Henry VI’s army. They repulsed a pursuing force, however, and news of the rising stimulated outbreaks of violence in Essex, Wiltshire (where Bishop Ayscough of Salisbury was murdered), and elsewhere. The king’s army soon disintegrated, and Henry and his court withdrew to Kenilworth in the Midlands. Thus, when Cade’s forces arrived back in Southwark on 1 July, they were able to enter London unopposed. There, after a form of trial, they executed the treasurer of England, Lord Say, and several other unpopular officials. The rulers of London, fearing disorders, joined forces with troops in the Tower under Lord Scales, and on the night of 5 July there was severe fighting on London Bridge. The following day a settlement was negotiated, with general pardons for all the rebels and a promise of commissions to investigate their complaints. The rebels then dispersed. Cade’s own pardon was soon nullified, and a few days later he was captured and killed in Sussex by the sheriff of Kent.

Jack Cade’s rebellion completed the disintegration of the household government of Suffolk and his allies, and the return of the dukes of Somerset and York to England in the late summer brought in a new phase of Lancastrian politics, a phase dominated by magnate rivalry. Unrest continued in Kent and Sussex for several years, even though the pardons were honored and commissions were sent there to investigate complaints of extortion and misgovernment. For the next quarter of a century Kent provided a reservoir of support for opposition movements against both Lancastrians and Yorkists.

Cædmon (fl. 657–80)

The first English poet with any vernacular work surviving (“Cædmon’s Hymn”), who invented English religious poetry by combining secular verse techniques with Christian subject matter.

Bede tells the story in his *Ecclesiastical History* 4.24, the only source. Cædmon was a cowherd at the monastery of Abbess Hild at Whitby. One night, after leaving a feast at the monastery in order to avoid performing with the harp, he had a dream in which a man commanded him to sing. Although he demurred, the man insisted that he do so and gave him the subject matter for his song: the Creation. At this Cædmon began to sing the poem that has come to be called Cædmon’s Hymn, the first recorded English poem. Upon waking Cædmon reported his dream to the steward and then to Hild and her advisers, who recited another biblical narrative to him and asked him to turn it into song as well. When he had done so, he was invited and chose to become a monk and devoted his life to composing vernacular poetry based on religious subjects.

Bede lists Cædmon’s works, which included poems on Genesis and Exodus, the life of Christ, the apostles’ teachings, the Last Judgment, and heaven and hell. None survive, but the list resembles the contents of Bodl. Junius 11, which has thus been called the “Cædmon Manuscript,” though its contents are not now attributed to Cædmon.

Cædmon’s Hymn survives in Northumbrian and West Saxon versions; the

latter follows:

Nu sculon herigean heofonrices weard,
metodes meahte and his modgepanc,
weorc wuldorfæder, swa he wundra gehwæs,
ece drihten, or onstealde.
He ærest sceop eorðan bearnum
heofon to hrofe, halig scyppend;
pa middangeard moncynnes weard,
ece drihten, æfter teode
firum foldan, frea ælmihtig.

[Now should we praise the guardian of the heavenly kingdom, the power of the Creator and the counsel of his mind, the works of the Father of glory, how he, the eternal Lord, originated every marvel. He, the holy Creator, first created the heaven, as a roof for the children of the earth; then the eternal Lord, guardian of the human race, the almighty ruler, afterward fashioned the world as a soil for men.]

Cædmon composed in the repetitious style associated with formulaic, memorized verse. The three-part poem turns on the favorite subjects of the Anglo-Saxons: praise, mind, power, time, and God, who creates the earth as a metaphorical hall (“heaven as a roof”) for human beings to live in. In verse 6b the brand-new poet calls God “scyppend” (Shaper), punning on “scop” (Shaper, poet).

Some cynics dismiss the whole story as another miracle tale, but Bede, fond of miracles, never uses the term “miracle” about Cædmon. Hild’s scholars saw Cædmon’s accomplishment as a heavenly gift, while modern critics debate how an illiterate cowherd suddenly learned to compose sophisticated verse. Theories include overcoming stage fright, practicing secretly, and modifying formulas heard in secular verse.

Cædmon’s style and subject matter dominated Anglo-Saxon verse for 400 years and probably reinforced the native tendency toward stressed meter. In that sense Cædmon, encouraged by Abbess Hild, “invented” English verse as we know it.

Caesarius of Arles (469/70–542/43)

Archbishop of Arles in southern France from 502 until his death. Caesarius presided over a number of important synods and was widely revered both for his holiness and his pastoral concern. His greatest influence on later times, and most especially in medieval England, comes through his sermons. In his day bishops had a monopoly on preaching, and Caesarius was seriously concerned that his flock could hear sermons far too seldom. He argued successfully that priests, even poorly educated ones, ought to be able to read to their parishioners sermons drawn from the Fathers of the Church, and he secured a canonical mandate that made this possible. He then produced a collection of over 200 sermons, many of which were edited, simplified, or abbreviated versions of sermons available to him from the patristic tradition.

These sermons, which convey essentially Augustinian theology in simple, clear language, appear to have answered a need at a later time when learned priests were in short supply, for Caesarius appears as a major source for a substantial number of the anonymous OE homilies as well as for the learned Ælfric. He is the source for the controlling image in the Exeter Book poem *Vainglory*, and the rhetorically powerful Last Judgment speech of Christ to the sinners in the Exeter Book poem *Christ III* is translated almost word-for-word from Caesarius.

Of the more than 30 OE texts that use Caesarius many select details that his contemporary biographers cited as reasons for the popularity of the sermons in his own day. His talent for choosing simple but striking examples clearly impressed the OE homilists, who borrowed his moving account of the rewards for offering no more than a cup of cold water or a fragment of bread, his chilling account of dry bones speaking to sinners in need of repentance, and his comparison of Lent to this world and of Easter to the next. A pastoral concern that his biographers said caused him to preach on Judgment Day in his sleep clearly contributed to the poetic speech of Christ noted above as well as to several OE sermons on the Last Judgment. And his admonitions concerning the perils of drunkenness appear in quite literal translations in a number of the English texts. His English adapters seized upon his ability to make matters memorable, but they in turn served Caesarius well, in that the most successful of their close translations of him reached a rhetorical level that was rarely exceeded in OE homilies except by Ælfric.

Caligula (Cotton) Troper

A fragment of an illustrated troper of the 11th century forming the first portion of manuscript BL Cotton Caligula A.xiv and one of only three trope manuscripts surviving from Anglo-Saxon England. The troper's place of origin is unknown; Canterbury and Hereford have been suggested, neither on convincing grounds.

The manuscript contains tropes (i.e., musicotextual additions) to the Proper chants of the mass (i.e., the chants whose text and music vary from feast day to feast day, as distinct from the Ordinary chants, whose texts remain the same throughout the church year) arranged in an annual cycle. It is a troper of the anthology type, being a compilation from available trope repertoires like most French troopers rather than a prescriptive liturgical book like the famous Winchester troopers. It includes the overwhelming majority of the proper tropes represented in the Winchester trope manuscripts. It also contains a substantial number of unique tropes, but these pieces are extremely varied in style and language, and it is unlikely that they are new compositions, although some may well be English. The notation is strictly adiastematic; in contrast to most music manuscripts from Anglo-Saxon England absolutely no use is made of significative letters.

The manuscript's surviving decoration consists of one painted initial introducing the principal mass for Christmas day and eleven paintings of christological and hagiographical subject matter introducing ten feasts. The paintings are surrounded by Latin hexameter inscriptions, newly composed to accompany the pictures, which describe and comment upon the events and characters represented. The paintings are considerably varied in subject matter

and format, and there is little sense of the collected illustrations as a proper picture cycle. The style and technique of the paintings are unparalleled in contemporary manuscript art, the most remarkable features of the characteristic style being the unusual palette dominated by warm colors and the use of a pair of contrasting hues to define local color. The painting technique is not consistent throughout the codex, but the modifications are not abrupt, and the paintings are most probably the work of a single artist who mastered both a fully painted style and a drawing style. The manuscript contains the earliest surviving western medieval representation of two of the subjects depicted (the Annunciation to Joachim and the Temptation of St. Martin), and the iconography of the paintings is sometimes innovative (the Ascension of Christ and St. Peter's Release from Prison). The fragment is also noteworthy for the inclusion of illustrations to common feasts (e.g., the images The Community of the Apostles and the Community of Virgins).

Canterbury, Ecclesiastical Province of

Although the church of Canterbury may be said to have originated in 597, with Augustine's mission from Rome, the province itself was obviously a much later development. Whether Pope Gregory intended a diocese to be established at Canterbury or not, Augustine's conversion of Æthelberht, king of Kent, and his establishment of the first great church there gave Canterbury a definite primacy or leadership. It is unhistorical to speak of a province at this time, but the status given to Canterbury by Augustine was later seen as important in

defining its archiepiscopal or metropolitan status within the church in England. His followers, Mellitus and Justus, went on to establish Christian centers or dioceses at London and Rochester, and the organization of the English church into dioceses is associated with Archbishop Theodore in the 7th century. However, it cannot really be argued that there was much structure in the English church before the 12th century.

In practice the development of the organizational framework was slow and took place after the Norman Conquest. There were three attempts in the 12th century to establish further metropolitan sees (besides Canterbury and York): by Henry of Blois at Winchester, by Gilbert Foliot at London, and by Bishop Bernard at St. David's. All were resisted, however, by a papacy increasingly concerned with organization and structure. By 1198 the territorial pattern of the English dioceses within the provinces of Canterbury and York had been settled, to remain without major alteration until the 16th century.

The English episcopal sees subject to the archbishop of Canterbury were thirteen in number: Bath and Wells, Chichester, Coventry and Lichfield, Ely, Exeter, Hereford, Lincoln, London, Norwich, Rochester, Salisbury, Winchester, and Worcester, plus the four Welsh dioceses of St. David's, St. Asaph's, Bangor, and Llandaff. These dioceses were the southern province, and they embraced England from the mouth of the Humber southward: the archbishop of Canterbury was their metropolitan. The archbishop of York, as metropolitan of the northern province, had jurisdictional rights over Durham, Carlisle, and Whithorn (although his rights in this last were seriously disputed by the Scots).

Before the 13th century and the age of archiepiscopal registers it is difficult to get a clear picture of the exercise of metropolitan rights. Afterward they may be defined as follows. First, the archbishop (as metropolitan) had the right of visiting churches in the dioceses of his province. Metropolitan visitation can be seen at its most active under Archbishop William Courtenay, who between 1384 and 1390 alone visited the dioceses and cathedrals of Exeter, Bath and Wells, Worcester, Chichester, Lincoln, and Salisbury.

Second, the archbishop could hold a convocation or council of the clergy of his province. Third, he had a provincial court, the Court of Arches, which acted as an appeals court for the province. Court records were not entered in the archiepiscopal register, and few case records survive before the Reformation. The court, however, came to have a settled venue in London, at the church of St. Mary of the Arches (or le Bow).

Fourth, the archbishop could prove wills of persons who died owning property in more than one diocese or where the goods were *notabilia* (worth more than £5). This right of the metropolitan accounts for the vast series of Prerogative Court of Canterbury wills (now in the Public Record Office, London). These include royal wills and wills of the major landowners.

Fifth, the archbishop had *sede vacante* jurisdiction, complete jurisdiction over the diocese, when any of the sees subject to him were vacant (without a bishop). His registers record the regular exercise of such jurisdiction over vacant sees. On the death of a bishop within his province the archbishop appointed a vicar or keeper of the see to perform all episcopal acts on his behalf; ordination, collation, institution, proof of wills, visitation. The registers of the keepers' transactions came to be bound into the archiepiscopal registers. Cardinal Morton's register, for example, includes miniregisters for Coventry and Lichfield (1490), Bath and Wells (1491), Winchester, Exeter (1492), Lincoln, Bath and Wells (1495), Coventry and Lichfield, Rochester (1496), Worcester (1498), and Salisbury and Norwich (1499).

Fig. 34. Canterbury Cathedral, ca. 1200. After G. Webb (1956). Reprinted by permission of Yale University Press.

Canterbury Cathedral

Canterbury Cathedral (figs. 34–35) was, in the Middle Ages, both the seat of an archbishop, the primate of England, and the church of one of the most important monasteries in the country, whose prior might vie in importance with the archbishop when it came to architectural patronage. After 1170 Canterbury Cathedral was also the site of the most important shrine in England, that of the martyred archbishop Thomas Becket, and its architecture reflects these multiple functions and meanings. The present fabric contains work from the immediate post-Conquest period to the eve of the Reformation, and its major campaigns of construction were each extremely important in the history of English medieval architecture.

The Anglo-Saxon cathedral has only recently (1993) been discovered under the nave of the present church. While any full evaluation must await the publication of the excavations, it is clear that it was a large building, underlying almost the whole of the present nave and extending an unknown distance eastward under the crossing. This church was destroyed by fire in 1067 and was rebuilt by Archbishop Lanfranc from around 1070. The eastern arm and liturgical choir under the crossing must have been complete by 1077, and the whole building was finished by Lanfranc's death in 1089. Lanfranc had been abbot of William the Conqueror's abbey of St. Etienne at Caen before William made him archbishop of Canterbury, and the new cathedral showed a marked resemblance to the Norman abbey church. Similar are the plans with their staggered eastern chapels, transepts with tribune platforms providing access to upper transept chapels, naves of nine bays with similar dimensions, and a general similarity of elevation consisting of arcade, wood-roofed gallery, and clerestory. Canterbury, on the other hand, had a crypt while Caen did not and shows no evidence of the clerestory passage that was such an important feature at Caen. The present nave and (west) transepts preserve all the dimensions, except the vertical, of Lanfranc's church, and fragments of the 11th-century design are still visible on the transept interiors and under the aisle roofs of the present nave.

Fig. 35. Canterbury Cathedral, south elevation of presbytery from the northeast. Courtesy of L. Hoey.

The great outburst of Anglo-Norman reconstruction that began around 1080

must have soon made the dimensions and perhaps plan of Lanfranc's church seem outmoded, and around 1096 a vast new eastern arm was put into construction. Anselm was archbishop when construction began, but the moving figure behind the new campaign was likely the prior Ernulf. In addition to providing more room for the stalls of the rapidly growing monastery the new eastern arm also made possible the better veneration of Canterbury's many relics, including those of its Anglo-Saxon saints whose sanctity had been questioned by Lanfranc but who had been rehabilitated by around 1100. The new choir replaced the *en echelon* apses of the first Norman church with an ambulatory opening into a square-ended axial chapel and two side chapels that originally carried towers set at an eccentric angle to the main body of the church. The new choir also included a new eastern transept and was carried on an immense crypt, the largest and most lavish ever constructed in England.

The main elevation of this work was rebuilt after the fire of 1174, and although we have the description of the Canterbury monk Gervase to aid us, certain details, particularly the precise form of the middle story, remain unclear. There was an arcade of unbroken cylindrical piers, with some sort of gallery and a clerestory above; the elevation lacked any vertical articulation except at the chord of the apse, and the whole was covered by a wood roof. William of Malmesbury's appellation of "glorious choir" has remained tied to this work, although he may have had in mind the stained glass, paintings, and furnishings more than the architecture itself. The lack of a high vault and bay-dividing shafts, as well as the use of cylindrical piers, must have given Ernulf's choir an archaic look that may have been intentional, harking back to early Christian churches in Rome. Of this grand project the crypt remains in its entirety, along with the lower parts of the outer aisle walls and eastern transepts and the chapels of St. Andrew and St. Anselm.

In 1174, four years after Becket's murder, the "glorious choir" was consumed by fire. Gervase's account makes clear that it was not completely destroyed and that the monks had hopes of rebuilding it as it had been, but the master they brought in to effect the repairs, one William of Sens, convinced them that a more complete reconstruction was advisable. Construction began in 1175 and was complete by 1185, and Gervase's account of it is the most complete such narrative we have surviving from the Middle Ages. Midway through the reconstruction William of Sens fell from the scaffolding and was unable to continue supervision of the work; his successor was another William, whom Gervase designates "the Englishman." Although the architectural work was completed in ten years, the furnishing of the choir and in particular the construction of Becket's shrine were long delayed as a result of bitter quarrels between the monks and successive archbishops in the late 12th century, followed by King John's equally bitter quarrel with the pope in the early 13th

century. The new work was dedicated only in 1220.

William of Sens was forced to retain the outer walls and thus the plan of the Romanesque choir, excepting only its eastern termination. He raised these outer walls to provide the aisles the height of the Romanesque aisle and gallery combined and in the choir proper (west of the east crossing) placed a high arcade of alternating round and octagonal piers opposite them. Above this he set a gallery with grouped openings, a clerestory with an interior wall passage, and a covering of six-part rib vaults, the whole articulated liberally with dark Purbeck marble shafts. East of the east crossing, in the presbytery, the main vessel narrows as it follows the curve of the Romanesque ambulatory and the central floor level rises in two flights of stairs toward the feretory in the Trinity Chapel. The latter, designed entirely by William the Englishman, was built beyond the limit of the Romanesque choir over a high crypt to contain the shrine of Becket. The presbytery piers are given various numbers of detached shafts to provide a visual crescendo, abetted by the narrowing and raising of the main floor level, to the shrine and its architectural surrounding, where the piers become coupled shafts of variegated colors, and the capitals themselves are carved of Purbeck marble. When combined with the stained glass, the colored inlaid floor tiles, and the glitter of the shrine itself the Trinity Chapel must have made an overwhelming impression of visual opulence. Beyond it stands the curious Corona, designed probably to contain the reliquary of Becket's scalp. The whole work might be seen as a carefully designed and theatrically effective architectural progression to enhance the relics of the martyred archbishop.

Against this view of careful planning is the obvious but difficult-to-interpret evidence of various changes in plan as the work progressed. The Trinity Chapel appears actually to have been a second thought, and the form of the originally planned eastern termination remains controversial. It is clear that these hesitations or rethinkings applied to the structural system as well. In the south choir of the gallery William of Sens employed the rare device of transverse barrel vaults, although he abandoned these in the north gallery in favor of more typical wooden roofs but with external buttressing walls that become true, if unusually low, flying buttresses in the presbytery, a system that continues in the Trinity Chapel. Given the secure dates of Canterbury, this evolving experimentation with buttressing systems is important for the history of Gothic architecture.

The Canterbury east arm is generally seen as representing the first complete appearance of a mature French Gothic style on English soil. There is no single French source for Canterbury, however, for while the three-story elevation is similar to Sens and to the putative elevation of Suger's choir at St. Denis, the detailing and detached shafts are closer to Laon and other buildings in the

northeast of France. In addition the continuation of the thick-wall tradition at Canterbury is evidence that English Gothic would develop as a style with formal concerns by no means identical to those across the Channel.

The last major campaign of reconstruction began at Canterbury about 1377 with the destruction of Lanfranc's nave and the laying out of a new one, which was essentially complete by around 1405. The design, usually attributed to Henry Yevele, is associated with the royal workshops in which Yevele was active. Opportunities for such full-scale reconstructions of great churches were rare by the late 14th century, and the Canterbury nave is thus one of the most important monuments of the Perpendicular style. Although constrained by the Romanesque plan, and continuing the three-story elevation used throughout the east arm, the nave embodies all the characteristics of Perpendicular style, with its overall patterns of paneled tracery used not only in windows but also for faces of the gallery. A clarity of design is visible also in the unbroken vertical bay divisions, so different from much earlier English Gothic, and in the lierne vaults of both aisles and main vessel.

The western transepts were also remodeled in Perpendicular style in the course of the 15th century, the north to serve as a setting for the actual site of Becket's martyrdom. The last major piece of work on the medieval cathedral was the construction of a new central tower in the latter years of the same century. Projects earlier in the century for the rebuilding of the tower had not been brought to completion, and the tower as built was the design of John Wastell, one of the most important architects of late-medieval England. Until the end of its medieval history Canterbury Cathedral continued to command the services of the best designers of the day.

Canterbury Picture Leaves

New York, Pierpont Morgan Library M.724 ([fig. 36](#)), 521, BL Add. 37472(1), and London, Victoria and Albert Museum 661, containing over 150 Old and New Testament scenes, running from the Childhood of Moses to Pentecost, on eight large sides, are now recognized as the prefatory cycle of the Eadwine Psalter (Cambridge, Trinity College R.17.1), produced at Canterbury in the late 1150s. The cycle was designed and most of it painted by the artist who, as principal illuminator, also executed most of the psalm illustrations and painted initials in the Eadwine Psalter itself. An initial leaf with Genesis scenes, now lost, has been posited on the basis of their inclusion in the related cycle prefacing Paris, BN lat. 8846, the closely related third Canterbury copy of the Utrecht Psalter made ca. 1200.

Although the context of the Leaves' creation is monastic, the style of the principal illuminator and his assistants is a later form of that initiated at St. Albans in the 1120s, which by mid-century appears to have been appropriated also by lay professional artists working at a number of English centers. The distinctive contribution of the Leaves' designer lies in the remarkable narrative effectiveness of the pages as entire units, as well as of the individual scenes, a result achieved by lively gestures, open scrolls, and the rhythmic repetition of compositions, motifs, and colors.

While Henderson argues for a textual rather than pictorial inspiration for the cycle, many features indicate the individual scenes' dependence on earlier visual models, as well as on extrabiblical texts. Theories of an underlying early Christian prototype, based on the derivation of the Leaves' twelve-square grid

layout from that of the miniature page in the 6th-century St. Augustine's Gospels (Cambridge, Corpus Christi College 286), have given way to recognition of strong Ottonian and Byzantine components, with limited Anglo-Saxon and Carolingian contributions. Though this range of sources may have been largely assimilated by mid-12th century into a general English motif pool, it reflects the rich variety of sources available to English Romanesque artists, both lay and monastic.

Canterbury Wall Paintings

Canterbury Cathedral appears to have displayed one of the finest cycles of wall paintings in all of England, with individual groups of frescoes dating from the 12th to the 15th century. The Romanesque paintings are the best known of the corpus due to both their excellent quality and their fine state of preservation (the result of having been covered over from the late 12th to the 19th century).

The paintings in St. Gabriel's Chapel in the crypt of the cathedral are considered the earliest of the surviving frescoes and are generally dated ca. 1155. The apse of the chapel is dominated by a monumental Christ in Majesty seated within a mandorla and flanked by four flying angels. On the south wall are scenes from the Infancy of Christ: Annunciation, Visitation, Adoration of the Magi (now lost). On the north wall are scenes from the life of St. John the Baptist: the Annunciation to Zacharias and the Naming of John the Baptist. At a slightly later date (1180s?) the vision of St. John the Evangelist with the personifications of the seven churches of Asia was added to the vaults and soffits of the outer arch. The cycle is painted in a byzantinizing style characterized by fully modeled faces, formalized expressions and gestures,

damp-fold draperies, and an overall symmetry. The combination of Infancy and apocalyptic themes unites this group with the wall paintings at Hardham and other Sussex churches.

The fire of 1174 destroyed all but one of the 12th-century paintings in St. Anselm's Choir (directly above St. Gabriel's Chapel). The surviving panel, located high up in the northwest corner of the apse in St. Anselm's Chapel, shows St. Paul shaking the viper from his hand (fig. 37). The chapel was originally dedicated to SS. Peter and Paul, and this scene may originally have been balanced by an image of St. Peter on the other side of the apse. The monumental figure of St. Paul fills the whole of the panel and stands out against the brilliant blue background. The damp-fold draperies reveal a figure of massive volume, and the head is fully modeled in the byzantinizing style of the day. Both figure style and the brilliant colors of the panel have strong affinities with the style of Master Hugo and the Bury Bible (Cambridge, Corpus Christi College 2). The panel is thought to date ca. 1163, and may have been commissioned by Thomas Becket to commemorate the translation of Anselm's relics to the chapel in April of that year. It was covered over by a buttress inserted during the 13th-century rebuilding of the choir.

A third cycle of 12th-century paintings was discovered in the Infirmary Chapel in the early 20th century. The original paintings have been lost through rapid deterioration and lack of conservation, but they were recorded in drawings made by W.D. Carøe in 1911. They appear to have been similar in style to the St. Gabriel's Chapel paintings and to have consisted primarily of figural ornament in three registers.

During the 13th, 14th, and 15th centuries further wall paintings, largely figures of the saints, architectural details, or painted monuments, were added to various parts of the cathedral. Most survive as mere fragments or have vanished completely (e.g., the 13th-century cycle in the choir and Trinity Chapel). Two notable exceptions are the 14th-century painting in the chapter house, carefully restored in the late 19th century, and the late-15th-century legend of St. Eustache painted in oil in the north choir aisle.

Cantilena

Medieval Latin term for song, generally applied throughout the Middle Ages to musical works composed or improvised, monophonic or polyphonic. In most cases it applies to a setting of a text, sacred or secular, but the term was also occasionally used to refer in a general way to instrumental music. It appears in medieval music-theory treatises with a variety of meanings and in a variety of contexts. For example, Johannes de Grocheio, writing in Paris in the late 13th century, uses "cantilena" as a kind of synonym for music in his definition of *rondeau* (*rondellus*): "a particular kind of *cantilena* is called rounded or a *rotundellus* by many, because it reflects back upon itself in the manner of a circle and it begins and is ended the same way." In another discussion of the same genre from the early 14th century "cantilena" seems to function as a kind of catchall term to describe chansons that appear not to belong within the confines of another medieval genre. Jacques de Liège, in book 7 of his *Speculum musice*, states that "this manner of singing (i.e., *discantus simpliciter prolatus*) has its place in ecclesiastical discants and organa measured in all their parts, in conducti, in motets, in *fugis*, in *cantilenis* or *rondellis*." The term "cantilena" was applied to songs composed upon a *cantus firmus* as well as to free compositions. The contexts described for the performance of these songs in the theoretical literature are both secular and ecclesiastical.

The generic character of this term no doubt accounts for its attractiveness to modern music scholars, who often find themselves without adequate medieval terminology to describe the musical genres they have identified. The modern application of the label "cantilena" to specific medieval compositions began with Heinrich Bessler in 1951, when he used the term *Kantilenensatz* to describe the musical style in some of the polyphonic songs of Guillaume

Dufay. This use has been expanded and clarified recently by Alejandro Planchart.

In 1963 Ernest Sanders settled upon “cantilena,” from among a number of medieval Latin terms for song, to refer to some English 14th-century polyphonic compositions, specifically those works notated in two- or three-part score format with sacred or liturgical texts that were freely composed, that is, not based upon a *cantus prius factus*. This original definition has been refined in his subsequent publications to apply primarily to works with a rhymed poetic text of moderate length, usually in honor of the Virgin Mary (1980, 1986). Sanders describes this music as “treble dominated,” with passages of significant length that employ parallel, complete triads configured in first inversion; that is, the chords are presented one after another with the third of the chord as the lowest sounding pitch. While there are brief examples of this type of triadic parallelism in 14th-century English works based upon a plainsong, this device was employed systematically and extensively in English polyphonic free settings and is a hallmark of their style.

Sanders’s use of “cantilena” to identify these works has not met with complete acceptance. Alejandro Planchart feels that Sanders’s definition is too restricted and that the term should be used to describe a number of songlike, Latin-texted polyphonic compositions, such as those by Dufay mentioned above. William Summers has noted that Sanders’s application of this term to English polyphony does not rest on medieval authority. He also has shown that other medieval polyphonic repertoires that have been described as treble-dominated, such as the Petronian motet, the Ars Nova motet, or English compositions from the 14th century composed in the so-called “chanson style,” are works where the composer establishes a well-defined hieratic relationship among the various parts, clearly differentiating the role of each voice in the musical fabric by one or more means, such as rhythmic activity, range, and presence or absence of text or melodic design. In English works designated as “cantilena” by Sanders all parts participate equally in the presentation of the text, move at approximately the same pace rhythmically, have comparable melodic design and ranges, and also participate fully in the continuous projection of the harmony through time. While the uppermost-sounding voice might well command some degree of attention because of its pitch level, the other voices do not play an overtly secondary role either melodically, rhythmically, or harmonically, the way supporting voices do in other demonstrably treble-dominated genres. It is perhaps more appropriate to describe this music as equal-voiced polyphonic song rather than as treble-dominated.

Recent research by Peter Lefferts has refined the definition of this English genre. The central core settings that make up this repertoire are those in honor

of the Virgin with a double-versicle poetic text. The conditions for their use as substitute settings for existing liturgical categories, such as Sequence and Offertory, or as trope texts for the Ordinary and Proper of the mass, are explored and also compared with newly composed monophonic compositions that appear to have been used as substitutes for the same liturgical categories.

No English medieval commentator discussed or named this important genre. One reason for the silence of the theorists may be the fact that the genre was relatively new in the 14th century. The extremely fluid liturgical use of the cantilena, which varied from major rite to major rite and from institution to institution, may have been another cause for this silence. Today the term continues to identify this body of English compositions, which are a unique English contribution to medieval music. The application of the term “cantilena” should be extended to those monophonic compositions that closely parallel the polyphonic settings in subject matter, textual type, and liturgical function. Both groups might more accurately be designated as English Marian polyphonic or monophonic cantilenas, in recognition of the fact that their composition was strictly confined to England and that only a few examples of this genre carry texts on a topic other than the Virgin Mary. This would prevent the confusion that arises when “cantilena” is used to refer to polyphonic works from other regional Latin song traditions and also permit the appropriate cross-referencing between the monophonic and polyphonic examples in this genre.

Capgrave, John (1393–1464)

Augustinian friar of Lynn, theologian, chronicler, and biographer. One of the most learned men of his day, he wrote a number of theological commentaries in Latin, of which those on Genesis, Exodus, and Acts have survived. Capgrave is perhaps best known for his *Abbreviation of Chronicles*, a universal chronicle in English beginning with Adam and ending in 1417 and drawing much of its material from Martin of Troppau and Thomas Walsingham. He also wrote a biography of *Illustrious Henrys* in Latin and, in English, verse lives of St. Norbert and St. Katherine of Alexandria and prose lives of St. Augustine and St. Gilbert. He visited Rome in 1450 and a year later wrote a guidebook, *The Solace of Pilgrims*.

Capgrave's works constitute the classic case of autograph/holograph materials (manuscripts containing the author's handwriting) in ME and facilitate the study of 1) the language of one man writing at one time in one place and 2) how an author sought and obtained patronage. Capgrave's patrons included heads of religious houses, local dignitaries, Bishop William Gray of Ely, Humphrey duke of Gloucester, and kings Henry VI and Edward IV.

Caput Mass

One of the most popular masses of the 15th century, surviving complete or in part in seven known English and continental sources, the *Missa Caput* is now thought to be the work of an unnamed English composer writing in the later 1430s or early 1440s. It is a cyclic mass whose five movements are unified both by a motto beginning and by the use of the same melody as structural *cantus firmus* in the tenor voice. Its name is taken from that *cantus firmus*, which is derived from a lengthy melisma on the word “caput” at the end of the responsory *Venit ad Petrum*, a plainsong sung at the Mandatum Ceremony on Holy Thursday in the medieval English Sarum rite. In each movement this melody is presented in its entirety twice, first in ternary mensuration and then in binary mensuration. Long believed to be a quintessential work by the leading continental composer of the era, Guillaume Dufay (ca. 1397–1474), the *Missa Caput* is now believed to be the “lost English Caput” hypothesized by Bukofzer. The attribution to Dufay, firmly set aside in the late 1960s and early 1970s, is still encountered in some more recent works of scholarship.

The historical significance of this masterwork is threefold. First, source evidence suggests that the *Missa Caput* took pride of place among a major group of anonymous English masses that circulated together on the Continent in the later 1440s and 1450s, including *Salve sancta parens*, *Quem malignus spiritus*, *Fuit homo*, and perhaps also *Veterem hominem*. Second, in a chain of direct emulation (and perhaps homage), the English Caput was drawn on as a model for Caput masses by two of the leading continental composers of the

second half of the 15th century, Johannes Ockeghem (ca. 1410–1497) and Jacob Obrecht (ca. 1450–1505). Finally, the *Missa Caput* has a structural twin in another anonymous English mass cycle, the *Missa Veterem hominem*. There are other English mass twins as well, perhaps taking their point of departure from the *Caput* / *Veterem* pair, and it is believed this English practice was the stimulus for similar pairings by continental mass composers after 1450.

Carol

Though the word “carol” has a long and varied history, it is used in Middle English studies particularly as a specific term for a distinct poetic and musical form cultivated mainly during the 15th century. The complete identifiable poetic repertoire with English texts is published in Greene and amounts to almost 500 poems; a few more were excluded from that volume because of their exclusively Latin texts, though they are plainly carols of English origin and appear together with the others in the sources. Nearly all the known pre-1485 music (over 130 pieces) is published in Stevens in *Musica Britannica*, vol. 4 (1952), 2d ed., 1958. Later examples are presented alongside other material by Stevens in *Musica Britannica*, vols. 18 (1962) and 36 (1975); they are far less distinct from other music or poetry of the time and show the form losing its individuality.

Greene defined the carol as a poem “intended, or at least suitable for singing, made up of uniform stanzas and provided with a burden that begins and ends the piece and is to be repeated after each stanza.” It is therefore related to the continental *virelai*/*villancico* traditions, though the carol has several distinct characteristics of its own. The refrain or burden is usually metrically distinct from the verse, which in its turn never has the repeated music for the *couplets* of the *virelai* and tends to lack the *tierce/vuelta* of the continental forms. Latin words, lines, or slogans are common in the poetry. The text never treats of courtly-love themes but is devotional or instructional in intent, quite often with a seasonal message for Christmas or one of the other church feasts. Most importantly there is in both text and music of most carols a popular feel, though they seem popular by destination rather than by origin and it is tempting to associate the genre with the efforts of the Franciscans. Yet a glance through the musical repertoire shows many and varied references to the *virelai*/*villancico* traditions of which it is an offshoot.

Four musical sources offer the clearest definition of the genre: the Trinity College *rotulus*, or roll (Cambridge, Trinity College 0.3.58; ca. 1430), with thirteen carols in a relatively simple homophonic style; the Selden Manuscript (Bodl. Arch. Selden B.26; ca. 1440), in which some 30 carols are mixed in among liturgical material, mainly processional; the Egerton Manuscript (BL Egerton 3307; ca. 1445), with 32 carols assembled in a distinct section; and the Ritson Manuscript (BL Add. 5665; ca. 1460), containing a discrete collection of over 40 carols in a more elaborate style. The varied provenance of these sources indicates a wide dispersal of the music throughout England, and the relatively few duplications among them suggest that a newly discovered source would contain much new music. A few more fragmentary musical sources survive, and there are at least two possible English carols in continental manuscripts of the time. But the carol seems to have had virtually no international career, even though all other genres of English music in these

years appear widely in the continental sources and seem to have been valued highly.

Stevens presents the music by source and in the chronological order sketched above, making it surprisingly easy to see the carols musical and formal evolution. Various features are common to the majority of the carol music. First is the emphasis on two-voice writing, particularly for the verses, at a time when most polyphony was in three voices. Second is a tendency for the lower of those voices (the “Tenor”) to carry the main melodic line, a feature found otherwise only in the rather different German song repertoire of those years. Third is the purely scribal device in the sources of laying out the music not in separate voices but in quasi-score, with the text under the bottom voice only; this is largely a function of the musical style, with all voices moving at approximately the same rate, whereas for most other music of the 15th century such a layout would result in considerable waste of space. Fourth, related to these features as well as to the likely didactic function of the carol, is a preference for clear phrases, balanced and parallel, showing an awareness of the expressive power of the dance element in sophisticated music at a time when most other polyphony favored the limpid line that avoided easy parallel structures.

On the other hand there is an enormous variety of musical style and formal devices in the music—a variety that modifies the apparent simplicity of Greene’s formal definition for the poetry. It is not just that the music becomes more elaborate with the passing of the years, moving away from simple patterns to include irregularities of phrase length and bar length that are unusual for their time and deeply expressive. If the basic scheme is apparently of a three-voice burden or chorus alternating with a two-voice verse, it remains true that relatively few musical settings precisely follow that scheme. Often there are two burdens, one in two and the other in three voices, using essentially the same material. Often little snatches of three-voice music interrupt the verses, sometimes interpolating material from the burden, sometimes giving elaborated repeats of phrases from the verse.

The music is anonymous apart from the name “Childe” on *Iblessid be that lord* (Selden, fol. 28v) and “qd J.D.” [John(?) Dunstable] tantalizingly at the end of the added text for *I pray yow all* (Selden, fol. 5). The names “Smert” and “Trouluffe” found on many of the carols in the Ritson Manuscript can be identified with two West Country priests but do not look like ascriptions as such. All the two-voice music in one of the three known settings of *Pray for us thow prince of pes* (Stevens no. 106) appears within a Credo setting ascribed (unconvincingly) to the Burgundian court composer Binchois in a manuscript from Trent; but, pending a necessary investigation of the complicated matter of Binchois’s relationship with English music, it is unlikely that he had any hand

in carol composition.

There are substantial collections of carol poetry by John Audelay (ca. 1427) and James Ryman (1490s), both in manuscripts devoted to their own work. But the main body of the poetic repertoire is also anonymous and appears primarily in three scruffy little paper pocket books from the mid-15th century, all about 6 by 4 V2 inches in size: Bodl. Eng. poet, e.l (ed. Thomas Wright, 1848); BL Sloane 2593 (ed. Thomas Wright, 1856); and Cambridge, St. John's College S.54 (ed. M.R. James and G.C. Macaulay in *The Modern Language Review* 8 [1913]: 68–87). All include a small proportion of material that is not in carol form though otherwise identical with the repertoire in its themes, tone, and language, so they cast further doubt on simple definitions of the repertoire. Any future attempt to refine our understanding of the carol must begin with these alongside the musical sources.

It is hard to believe that the genre can have existed before ca. 1415, the presumed date of the famous Agincourt Carol. Although Greene's edition uses many earlier sources, virtually all of them contain either strophic poems only later adapted as carols or the occasional piece better explained in terms of other genres, such as the virelai or the versus. There is strong source evidence for a view that sees the Trinity College *rotulus* as containing the earliest clear evidence of the carol and sees the genre—quite exceptionally—as having been “invented” at about that time.

Cartularies

Registers in which are entered copies of property deeds, principally charters—hence the name “c(h)artulary.” They were made, usually in the form of books, to serve as accessible compendia so landowners could refer to them without

having to search among the original archives, often kept in secure conditions. Over 1,100 cartularies survive for English medieval ecclesiastical institutions, and about 180 for secular families.

Because they were created at different times to record archive material for different estates, there is considerable variation of format. Commonly charters are transcribed in full (although witness lists and routine clauses may be omitted or truncated) and arranged topographically, so charters for one particular property are grouped together. In the case of religious houses the charters relating to the foundation are often placed at the beginning of the cartulary, and there may also be special sections of papal, royal, and episcopal confirmations.

The earliest surviving cartularies date from the 11th century, and the majority are from the 13th and 14th centuries, though frequently additions were made after the original compilations had been completed. The content list of cartularies, where reference numbers to charters were given, often doubled as finding lists to the archives themselves.

Castles and Fortification

The castle is a fortified residence combining administrative and judicial functions but with its military considerations as paramount. The concept goes beyond just the defended residence, which has existed for much of history. The medieval castle speaks of political power and control of land. As part of the

feudal system of land tenure through military service, evolving from the disintegration of Carolingian Europe, it was a symbol and a physical representation of the fief, as well as of the social, economic, and military position of its holder.

While there is now some evidence for defended residences of Anglo-Saxon thegns in the 10th and 11th centuries, as well as fortified towns (*burhs*), it was 1066 that saw the introduction of the castle into England. The exception that proves the rule is a small group of documented castles in Herefordshire and one in Essex erected by Norman companions of Edward the Confessor before the Conquest. In Normandy the castle was a well-established feature of life by 1066 and was, together with the heavily armored knight, the means whereby the Norman Conquest was achieved and the way a foreign aristocracy and system of land ownership replaced that of the Anglo-Saxons.

Archaeological excavation in the last quarter-century has greatly advanced knowledge of castles. It is now unwise to take castles at the face value of their surviving structures. Most early castles, for speed and cheapness, were built of timber and earthwork, often rebuilt in stone. Earthworks were fronted or crowned with walls of timber, and towers and internal buildings were also in timber. Excavations at Hen Domen, Powys (Wales), have shown that a castle might be in use for more than 100 years without any of its elements being replaced in stone. The timber tower on the castle mound, or motte, at the royal castle at York evidently stood until 1228, when it was replaced by the masonry of Cliffords Tower in 1245.

Not all the earliest castles were timber. There were stone buildings of a palatial nature in London and East Anglia. Both the White Tower (London) and Colchester, Essex, had first-floor halls (i.e., a floor above ground level) on a grand scale and similar to the earliest known castles in northern France, Doule-Fontaine and Langeais. At Castle Acre, Norfolk, a masonry "country house" with a minimum of defensive enclosure was built shortly after 1066 and only later converted into a castle proper, defended by massive earthworks and enclosing walls. Elsewhere there were strong stone gatehouses of an early date, as at Exeter in Devon, Ludlow in Shropshire, and Richmond in North Yorkshire.

The two basic principles of medieval fortification were the enclosure and the tower. In the earliest English castles the most common form was the motte (a mound on a hillock) surmounted by a tower, together with an enclosure, or bailey, containing the hall and other residential and service buildings. A frequent variant was an enclosure (ringwork) without a motte but with a tower-gatehouse instead. In some instances, as at Castle Neroche in Somerset, a motte was a later addition to a ringwork.

An essential and distinguishing feature of the Anglo-Norman castle was the

tower, whether on the motte or over the gate. The contemporary name for such a tower was “donjon” (Lat. *dominium*, “lordship”). Sometimes it is clear that the tower was constructed first and the motte thrown up around it: Abinger in Surrey and South Mimms in Hertfordshire are examples. At other times it seems to have been set upon the surface of the mound, as at Okehampton in Devon or Longtown in Herefordshire. An alternative to a tower was the shell keep; a wall around the top of the motte with buildings against its internal face, such as Launceston in Cornwall, Totnes in Devon, and Carisbrooke, Isle of Wight.

In major castles there was a move toward concentrating the chief residential elements into a defensible tower, a development of the earlier hall tower: Norwich in Norfolk, Kenilworth in Warwickshire, and Rochester and Dover, Kent. In England these towers are termed “keeps” and could serve as defenses “of last resort” (as at the siege of Rochester Castle, 1215). Elsewhere smaller “keeps” might contain habitable rooms, though the chief buildings—the hall and chamber and guest accommodation—were usually elsewhere.

The development of castle defenses was marked by an increasingly scientific arrangement of mural towers for flanking purposes. These were originally square with a shift to circular and polygonal forms from the end of the 12th century. Later there was increasing emphasis on vertical defense. The weakest point in the defensive circuit was always the entrance, and gateways developed into well-flanked entrances between a pair of close-set towers. In the 13th and 14th centuries there was a tendency to strengthen entrances by adding barbicans (outer defenses). In the more important and chiefly royal castles concentric defenses evolved, as at the Tower of London and Dover. Elsewhere water defenses might be developed, as at Kenilworth. The apogee of the English castle in its military and defensive form, perfected in north Wales, is seen in the castles erected on the orders of Edward I and largely to the design of the Savoyard engineer Master James of St. George: Conway, Caernarvon, Harlech, and Beaumaris.

Castles dominated the medieval landscape, and they were of more than just local significance. William, as duke of Normandy, had instituted controls over the castle building of his vassals, and “licenses to crenellate” had to be obtained, in theory if not always in practice, from the crown throughout the Middle Ages. Although castles were essentially the fortified residence of an individual lord, they could become part of a royal and later national defensive policy for the coasts, harbors, and border areas, particularly with Scotland. The castle was also the means by which the baronage could demonstrate their position in society. As the recognized center of lordship the castle was a display of status and prestige; “castellated” houses were the symbol of social position long after they had lost their military function, even to the present

century.

During the 14th and 15th centuries the military need for castles was much reduced. Lawlessness and aristocratic thuggery abounded, but England was not a theater of war, as were parts of France, except on the Borders, where the need for domestic protection extended a good way down the social scale. There was a move toward defensible houses that might have the title of castle, like Stokeway, Shropshire, or Nunney, Somerset, but where ostentation and domestic comfort had a far greater place than before. There was a spread of fortified manor houses, but these had ceased to be true castles. By the end of the 15th century Ralph, Lord Cromwell, would build himself a defensible tower-house at Tattershall, Lincolnshire, and at the same time the unfortified South Wingfield Manor in Derbyshire. Defensive considerations appeared to be optional.

There were other forms of fortification, involving towns. The Normans almost invariably planted a castle inside existing *burhs*. At the same time towns were created after the Conquest, usually for economic reasons. Their defenses were often linked with those of the associated castle. The incentive to fortify towns with stone walls and towers usually came from the merchant community, as at Southampton or Norwich. When gunpowder was introduced in the 14th and 15th centuries, it is more often in town defenses, rather than in castles, that the technical improvements in military engineering are to be found.

Caxton, William (1415/24–1491/92)

Printer, publisher, translator, and merchant. Caxton was born in Kent, though probably not at Strood, which has been suggested as his birthplace. After (or perhaps toward the end of) his apprenticeship as a mercer Caxton engaged in trade between England and the Low Countries, where he may have moved in the 1440s. Eventually he was appointed Governor of the English Nation at Bruges, a major commercial town. As part of his official functions he took part in foreign trade negotiations for the English government. In 1471, presumably after resigning his office, Caxton traveled to Cologne. In the course of a stay of some eighteen months he learned the technique of printing, possibly participating in the production of an edition of Bartholomaeus Anglicus's *De proprietatibus rerum*. After returning to Bruges Caxton established a press and produced the first printed English book, *The Recuyell of the Historyes of Troye*, his own translation from the French, begun in 1469 and encouraged by Margaret, duchess of Burgundy.

In 1476 Caxton returned to England and set up his business in the precincts of Westminster Abbey (i.e., in premises belonging to and near the abbey). The first major work printed there was probably his first edition of Chaucer's *Canterbury Tales*. In the next fifteen years he published some 100 or more works. Caxton died in late 1491 or early 1492, bequeathing his business to his long-time assistant, Wynkyn de Worde.

Caxton's choice of texts to print was both a response to and an influence in shaping fashionable demand and taste. Besides two editions of the *Canterbury Tales*, one of *Troilus*, and other collections of Chaucerian verse he published Gower's *Confessio Amantis*, several works by Lydgate, and Burgh's *Cato*. In 1485 he printed Malory's *Morte Darthur*, and this edition and its reprints remained the sole witness to the *Morte* until the Winchester Manuscript was discovered in 1934. Influenced by Burgundian or French taste, he translated and published prose works in the courtly mode, including *Jason*, *Godefroy of Boulogne*, *Aesop*, *The Order of Chivalry*, *Charles the Great*, *Blanchardin and Eglantine*, and *Eneydos*.

Moral and religious works published by Caxton include Chaucer's *Boethius*, Mirk's *Festial*, and *The Mirror of the Blessed Life of Christ*, as well as translations by Earl Rivers (*The Cordial*, *The Diets and Sayings of the*

Philosophers, and *Moral Proverbs*) and by Caxton himself, such as *The Mirror of the World*, *The Golden Legend*, *The Book of the Knight of the Tower*, and *The Art of Dying*.

Caxton produced editions of the two most popular historical works of his day, Trevisa's translation of Higden's *Polychronicon* and the prose *Brut* (under the title *Chronicles of England*), both of which he brought up to date with material compiled by himself. He also published a number of practical works: *The Governal of Health*, a French-English vocabulary, statutes, devotional works, and a few Latin works on rhetoric that may have been used as university textbooks.

Of considerable importance are the prologues and epilogues to many of Caxton's publications, in which he comments on his choice and treatment of texts and on matters of style, language, and the function of literature. His own prose style is prolix and shows a predilection for elevated foreign words. As an editor he sometimes updated old-fashioned vocabulary, as in the *Polychronicon*, or revised sections of the text, as in book 5 of the *Morte Darthur* (though some scholars suggest the revisions are by Malory himself).

Caxton's translations and other publications are representative of late-medieval practices and tastes; his primary importance lies in his highly successful introduction of the revolutionary technique of printing to England.

Cemeteries and Cemetery Archaeology

The Anglo-Saxons practiced both inhumation and cremation, many burials being accompanied by grave goods. Some of the early-5th-century urns in which incinerated bodies and objects were placed are similar to those found in the Elbe-Weser area of Germany and show where some of the migrant peoples originated. East Anglia has several cemeteries that originally must have contained more than 1,000 urns, but in the rest of England cemeteries are smaller and inhumations commoner. Sixth-century cemeteries tend to have fewer graves and fewer objects than earlier ones, but there are also more sites known. In the 7th century the custom of burying objects with the dead waned and cremation all but ceased. Some “final phase” cemeteries have graves with no more than a knife and a buckle, if that. There are also several isolated 7th-century burials in barrows—some prehistoric, some newly constructed—with richly ornamented objects and traces of elaborate ceremonial practices.

Archaeologists seek a range of information from cemeteries. Objects are informative about the wealth and contacts of the peoples who buried them. Some objects came from the Near East and Egypt, such as copper-alloy vessels usually found in what are clearly well-furnished graves. These things suggest a society in which a few had access to resources, marking them as being of high status. This trend increased during the 6th century and culminated in the 7th century with such burials as Taplow and Sutton Hoo, with objects of gold and silver, drinking vessels, textiles, musical instruments, and weapons; swords seem to have been especially prestigious. Women were more often buried with costume jewelry, beads, and such household items as keys.

Such data help us analyze the different attitudes to the sexes and their roles. While successful men seem to have been viewed as warriors rather than workers, women were expected to run the home. Occasionally skeletons are found in contorted positions; explanations of ritual slaughter or live burial are proposed but difficult to substantiate. Visualized as an entity, a cemetery suggests a relatively orderly society, the regular arrangement of the burials indicating regulation of the graveyard and careful laying-out of the bodies

suggesting people with time to make seemly provision for their dead.

The human bones from cemeteries indicate an adequately nourished population, though an occasional case of rickets shows vitamin D deficiency. Average heights for women ran from 5 feet 1 inch to 5 feet 5 inches, for men another two or three inches, a range similar to European populations in the 19th century. Infant mortality was high, though difficult to estimate precisely. Those who survived childhood might expect to live until their 30s, although many young women died in childbirth and young men succumbed to accidents. A fair proportion of those who reached their mid-20s would live into their 40s and 50s. These figures are what might be expected from a society primarily concerned with agriculture and not subject to excessive food shortages or violence.

Chancellor and Chancery

The origins of the medieval chancery are found in the scriptorium, or writing department, of the king's chapel in the Anglo-Saxon royal household. Because the king's chaplains were literate, they naturally undertook his secretarial duties, and by 1066 England had a mature secretariat that issued documents under the king's great seal and also had custody of records. It was already a chancery in all but name. Likewise the official who kept the great seal was the direct linear predecessor of the post-Conquest chancellor, although not so called. As Normandy had nothing comparable, the Conqueror took over the scriptorium and its officials. The only change he introduced was to replace OE with Latin as the language of royal writs. The title "chancellor" was first certainly applied to the head of the department early in his reign.

As the powers and range of the central government increased in the 12th century, particularly under Henry II, so the work of the chancery expanded, although it remained part of the royal household and traveled with the king. Only in the 13th century did it slowly begin to break away and become a separate institution. There were two main reasons for this development. It needed a permanent base for its evergrowing archive, which expanded rapidly after 1199, when Hubert Walter instituted the practice of keeping enrolled copies of all main documents being issued. In addition the chancery was becoming larger and its operations therefore more formal; for much of his day-to-day business the king needed an institution more flexible and closer to him, and he used first the wardrobe and then the chamber with smaller seals.

The 13th century saw the chancery at the height of its importance. Its duties as the king's secretariat were so vast that in 1244 a subdepartment, the hanaper, was created, with its own keeper to receive the fees of the great seal and to meet chancery's expenses out of them. The office of keeper (later master) of the rolls was also established. Even in the later Middle Ages the chancery remained the principal administrative department; it supplied the clerks of parliament from its staff, and all documents of any importance had still to be authenticated by the great seal. Hence the demand of the opposition, in every baronial rebellion or constitutional crisis, for control of the chancery, the great seal, and the office of chancellor.

The later Middle Ages, however, saw the chancery's judicial role overshadow its administrative functions. In common with other institutions it had built up a jurisdiction in matters arising from its own activities or concerning its officials. That was its so-called "Latin side," and in hearing such cases it acted according to the common law. During the 14th century it acquired a much more extensive equity jurisdiction, which was to expand considerably during and after the 15th century. This expanded jurisdiction arose from the chancellor's position as the most important member of the king's council and from his normally being a leading ecclesiastic with a knowledge of civil and canon law

Petitions for the redress of grievances had for some time been addressed to the king and council. As the common-law procedures became slower, more stereotyped, and inadequate to deal with such new situations as those arising from uses (or trusts) and contracts, petitions became too numerous to be dealt with by the council. Many were therefore transferred to the chancellor, who sat in Westminster Hall, and ultimately most petitions were addressed directly to him. His equity jurisdiction was based on the relatively informal procedure of bill and answer, supplemented by interrogatory and deposition, all in the vernacular. Hence it was known as "the English side of chancery," and because of its reliance on English as its medium of argument the chancery played an

important role in standardizing vernacular vocabulary and usage (“chancery • standard” or “chancery English”).

Chancellors were nearly all ecclesiastics. At first they had often been archdeacons or cathedral dignitaries, and they resigned as chancellor on their frequent advancement to bishoprics. Around 1200 it was normal for the chancellor to be a bishop or even an archbishop before his appointment and then to hold both offices concurrently. From Henry II’s reign until 1234, and again between 1258 and 1265, the justiciar was the king’s chief minister. At all other times the chancellor held that position, although he never had formal vice-regal powers. The last and greatest of the medieval chancellors was Cardinal Wolsey (1515–29). His true successor was Thomas Cromwell, a layman and the first of the powerful Tudor secretaries.

Chantries

Strictly speaking a chantry was an endowed service for the souls of the founder and his relations, but the term came to include the resources attached to such endowments. The idea of providing for prayers in a permanent foundation was ancient, but it was not until the 13th century that the term *cantaría* came into general use to describe these establishments. During the later Middle Ages such foundations were a frequent form of pious endowment, particularly among the mercantile middle class, whose members wished to make spiritual provision for themselves but were not sufficiently wealthy to found a monastic house, as might be done by members of the landed class.

Chantries could be endowed in perpetuity, with landed rents, or for a term of years, by leaving a sum of money to support a priest to celebrate intercessory masses for the donor as long as funds lasted. This latter type of endowment was encouraged by the Statute of Mortmain (1279), designed to block the flow of land into the “dead hand” (*mort main*) of the church: the need to pay for a license to amortize property added to the cost of perpetual foundations.

A chantry with permanent endowments, however, could run short of funds, particularly in an age of declining rent levels, as followed the Black Death. In such cases chantries might be united, with one priest celebrating for the founders of both and arrangements being made to share the patronage. A London case of 1513 shows the right of appointment held alternately by the city authorities and the archdeacon of Colchester, while in York in 1486 agreement on the nomination was reached between two earlier patrons, the archbishop and the earl of Northumberland.

The numbers of chantries cannot be precisely estimated. In the 1530s the *Valor ecclesiasticus* records some 200 to 300 in London alone, and there were probably between 2,000 and 3,000 in the country as a whole at the time of their dissolution in the 1540s. But these were only the permanently endowed ones,

and short-term chantries certainly outnumbered perpetual ones among 15th-century foundations, though one cannot say whether they lasted sufficiently long on average to be more numerous overall. Chantry priests were therefore often insecure and impoverished; a salary payable to one in Lancashire in 1485 was only 4 marks *per annum*, although a contemporary London chantry priest would probably receive 10 marks.

This explains why many chantrists undertook other tasks, particularly as elementary schoolmasters in their parishes. They also contributed to parochial life, assisting the parish priest in hearing confessions at such peak periods of the year as Easter and supplementing the liturgical life of the church—a matter of importance in view of the strong tradition of late-medieval polyphonic music. Although visitation and court records show some chantry priests to be guilty of sexual immorality, there is no reason to believe that this was general.

Henry VIII obtained statutory power in 1545 to secularize chantry property, purely on financial grounds, though only a little of it was seized before his death. Most of it passed into lay hands during Edward VI's reign (1548–53), when a Protestant regency under the duke of Somerset came to power. The new doctrines rejected the belief in purgatory, the chantries' *raison d'être*, and they were now dismissed as superstitious institutions.

Chapel Royal (Royal Household Chapel)

The household chapel of the English kings, a special group of personnel always

in attendance on the ruler whose principal responsibility was to perform the divine service. The Chapel Royal is to be distinguished from two other major royal chapels of fixed abode founded by Edward III, the royal chapels of St. Stephen's at Westminster and St. George's at Windsor; its clerks and their duties are further to be distinguished from the King's Chaplains (a position emerging in the 1390s). There had always been chaplains at court who served the king, holding a variety of administrative responsibilities and functioning in a liturgical or ceremonial capacity as necessary. As a more specialized body the Chapel Royal was put on a new footing in the 13th century, in particular as documented in the 1270s during the reign of Edward I, from which time it may have begun to perform daily services. Though liturgical celebration was its day-to-day role, the most important function of the Chapel Royal was in fulfilling ceremonial needs as an emblem of kingship and of the royal presence at coronation ceremonies, crown wearings, solemn entries, anniversaries and commemorations, and other major state occasions.

The adult membership of the Chapel Royal consisted of ordained chaplains and lay clerks (the "capellani et clerici capelle domini regis"), who were joined from the early 14th century onward by a contingent of boys. Their numbers varied but were always substantial by contemporary standards; there were over 30 adults and ten boys in the mid-15th century. The Chapel Royal was the primary sphere of activity for a number of known composers, and it engaged in the performance of the most challenging polyphonic scores. Nonetheless, these activities may have preoccupied only a minority of its members; others, content to sing plainsong as demanded, became engaged in additional nonmusical activities at court, using their position simply as "one of a number of appropriate starting points for clerical careers in royal service" (Wathey: 83). Two 15th-century accounts of the composition and duties of the chapel are in the *Liber regie capelle* (1449) and the Black Book of the Household of Edward IV (ca. 1471).

Chapter Houses

The chapter house was, after the church, the most important and elaborate building of a monastic or collegiate ecclesiastical establishment. Monks would meet there daily (“in Chapter”) to hear parts of the monastic rule recited, to administer or receive punishment for infractions of that rule, to remember founders and benefactors, and to make the most important decisions regarding the administration or future of their institution, including the election of abbots, bishops, or other officials or decisions concerning lawsuits or other legal matters. Chapter houses were also prestigious places of burial for abbots or others important to the monastery. The chapter house, in short, served as a kind of corporate headquarters, and its architectural form and decoration were often testimony to its institutional importance.

England is most famous for its centrally planned chapter houses, but the vast majority of chapter houses constructed in the century after the Norman Conquest had rectangular plans, as in the surviving examples at St. Augustine’s, Bristol, or at Forde Abbey in Dorset; sometimes an eastern apse sheltered the chair of the presiding officer, as at Durham Cathedral Priory or originally at St. Peter’s, Gloucester. Square or rectangular plans remained popular throughout the Middle Ages in English monasteries, including most Cistercian houses, such as Fountains, Furness, Lacock, or Buildwas, to take some surviving examples. A notable Cistercian oddity was the chapter house at Rievaulx, where an aisle and ambulatory surrounded a central space and apse, perhaps the result of St. Aelred’s patronage in the 1150s. Monastic chapter houses were placed off the east cloister walk, close to the south (or north, depending on the cloister placement) transept of the church, from which they were usually separated by a passageway called a slype or a sacristy of some sort. Because the height of the chapter house might interfere with the monks’ access to the transept and choir from their dormitory, the former were often placed a certain distance off the east cloister walk and were preceded by a lower vestibule, as was the case at Fountains, Bristol, and most of the centrally planned chapter houses.

The earliest surviving chapter house with a central plan is that at Worcester Cathedral Priory, an originally circular building of the first quarter of the 12th century. A compelling historical reason for the adoption of this plan has yet to be found; the height of such buildings meant that they had to be placed farther from the cloister, and they probably made more awkward the performance of

most of the formal rites of Chapter, which generally had an eastern orientation. Symbolic or iconographic motivations may have played a role, as they did in churches dedicated to the Holy Sepulchre, but no documents or unambiguous evidence exist to suggest just what these considerations may have been with regard to English chapter houses. Whatever the initial reason for its use at Worcester, the plan was an obvious success, and such buildings became major prestige monuments in the 13th and 14th centuries.

The next examples are the late-12th-century chapter houses at Margam and Abbey Dore, both of them geographically close enough to Worcester to be considered its progeny, although both are early Gothic in style. They also show the move toward polygonal plans; at Margam the interior is still circular as at Worcester, but the exterior is twelve-sided, while at Abbey Dore both interior and exterior were dodecagonal. The first octagonal chapter house appears to have been that at Beverley Minster, of about 1230, and it was this plan that became most common in centrally planned English chapter houses, although a ten-sided plan was used contemporaneously with Beverley at Lincoln Minster and later at Evesham, Bridlington, and Hereford.

Octagonal plans were used for the chapter houses of secular cathedrals at Lichfield (where the octagon was elongated), Salisbury, Wells, Elgin, York, and Old St. Paul's; at the quasi-cathedrals of Southwell Minster and Westminster Abbey; in the Augustinian houses of Thornton, Carlisle (also a cathedral), and Bolton; the Premonstratensian house at Cockersand; and in the collegiate foundations at Howden, Manchester, and Warwick. These buildings span the entire duration of English Gothic and attest to the great popularity of the type over time as well as across ecclesiastical institutional lines. Except for Worcester, Westminster, and Evesham, Benedictine houses are noticeably absent from this list, because most of them had built chapter houses in the 12th century when the rectangular form was prevalent and lacked the resources or ambition to rebuild their chapter houses in the later Middle Ages.

In addition to being the first octagonal chapter house the Beverley building seems also to have been the first planned for a secular church, although Lincoln is a close contender for the title. The possession of a chapter house was not the necessity for a secular church that it was for a monastery, but more a matter of prestige. Sometimes cloisters accompanied these chapter houses, as at Salisbury, Lincoln, Hereford, or Carlisle (at St. Paul's the cloister surrounded the chapter house, and at Wells chapter house and cloister were set on opposite sides of the church). Often, however, the chapter house stood alone to the north or south of the choir, connected to it by a short passage, as at York, Southwell, Elgin, or Lichfield.

English chapter houses were focuses of architectural elaboration from the first. A number of the Romanesque examples, such as Bristol, Durham, Forde,

or Much Wenlock, had rib vaults, often, as in the first two examples, with geometrical decoration. Others, such as Reading or Gloucester, were covered by barrel vaults. Worcester itself was vaulted with an unusual rib vault, decorated with a dado arcade and built of polychrome masonry. Romanesque dado arcades were also built in the chapter houses at Bristol, Durham, and Gloucester. Such embellishment continued into the Gothic period, with dado arcades and vaults being virtually standard features in the buildings cited above. Polygonal chapter houses were ideal venues for large traceried windows, and from Westminster Abbey in the 1250s these also became standard features. Lierne vaults of increasing complexity were made to radiate from the central pierlike umbrellas in the chapter houses at Lincoln and Wells (figs. 38–39). At York the central pier was omitted and the vault constructed of wood, while the arrangement of seat canopies there is one of the prime examples of the Decorated love of contrapuntal spatial effects. As a final example of the pride and expense of English medieval chapter houses one might cite Southwell, with its prodigious display of naturalistic foliage sculpture.

Charles of Orléans (1394–1465)

Son of Louis duke of Orléans and nephew of the mad King Charles VI of France. In 1406 he was married to Isabella, the child-widow of Richard II, and after her death was married in 1410 to Bonne of Armagnac, daughter of the leader of the Orleanist faction in 15th-century French politics. He was captured at the Battle of Agincourt in 1415 and was not released, mainly for political reasons, until 1440.

Charles was a prolific writer in French, and during his 25-year imprisonment (spent in the country houses of various English aristocrats) he appears to have turned his attention to composition in English. The poems in BL Harley 682, some of which are rehandlings of the forms and themes of Charles's French poems, are usually accepted as his. The poems, mainly ballades, tell of two love affairs, one of which ends with the death of Lady Beauty and the other with the poet's release from prison. They are separated by a "jubilee," or celebration of love consisting of 94 roundels, though the intention was probably to have 100. The women who were the subjects of these sequences of poems, if they were based on real models, have never been satisfactorily identified.

Charms

An ancient genre, descending from pagan oral incantations, magical in intent and ritualistic in practice. Many later written versions are extant in OE and represented in Byrhtferth's *Lacnunga*, while others are scattered in miscellaneous manuscripts: against a sudden stitch in the side (attributed to witches), against a swarm of bees, against infertile land, and so forth.

Both Latin and ME versions abound in late-medieval manuscripts, often in or accompanying medical treatises or collections of alchemical or medical prescriptions. The *Liber de diversis medicinis* (EETS o.s. 207, ed. Ogden), for example, has a Latin charm for childbirth and one in English for toothache. The most popular types are "Flume Jordan" (for stanching blood), "Saint Susan" (for healing wounds), and "Saint William" (for worms, palsy, and gout). A large number of medical-type charms are based on the magical properties of the eagle: the right eye of the eagle gives grace and friendship, the left protects against all harm. Others derive from recipes from adder's skin. Some veterinary charms propose to "Depart thy malady fro thys hors"; others are to cure diseases among cattle.

The range of topics among nonmedical charms is wide; against enemies, for getting rid of mice and rats, identifying an unknown thief, or making a woman dance naked. A large number of charms have religious significance; invoking angels while rising from bed, while it thunders, or while eating or drinking, to bring protection from evil. One might invoke Dismas, the good thief crucified with Christ, or the three Magi, as protection against thieves. Making the sign of the cross while reciting three Greek letters and the Latin names of Christ ensures a safe journey.

Charters

Documents that record gifts or grants of property or rights by one party to another. In medieval England a transaction of this sort would take place in a ceremony before witnesses, and there was no legal obligation to make a written record. But increasingly, especially from the 12th century, the parties sought to have gifts and grants written down, and for this purpose the charter was the primary form of record available. Since, however, it was at the witness ceremony that the grantor actually put the grantee in possession, a charter was usually framed in the past tense, confirming what had taken place orally, and the names of the witnesses to the gift were recorded at the end of the text.

The charter certainly existed in England by 679, the date of the earliest surviving original, but it has been argued that charters had been introduced by Augustine of Canterbury in 597, and that some of the texts for the period between 597 and the later 7th century, which survive only in later copies, may be wholly or partly genuine, that is, copied from genuine originals, since lost. About 2,000 texts survive from the period before 1066, the bulk of them issued by kings in favor of monasteries, but from the later 11th century the numbers of all charters increased and the habit of charter giving began to penetrate lower in the social scale. By the 13th century even members of the unfree peasantry might issue charters. It has been estimated that in 13th-century England as many as eight million charters may have been written for smallholders and serfs alone.

Although usually expressed in terms of gifts and grants, either in fee or in alms, charters might record other types of transactions, such as sales and leases. As the number of charters increased after 1100, so there developed a variety of forms, using largely stereotyped clauses. Royal and episcopal charters tended not to bear dating clauses until the late 12th century, and for another century lay charters were generally undated. We use internal evidence in assigning dates to undated charters, particularly the evidence of the witness clauses.

Characteristically an original charter is written on one side of single leaf of

parchment, cut to fit the length of the text, and sealed with the donor's seal, which hangs on a parchment tag. Transactions in which there was an element of compromise or contract, such as agreements and leases, might be recorded in bipartite or tripartite documents. Identical copies were on a single piece of parchment, then divided along an indented line; these might be called "chirographs" or "indentures." Only a small proportion, perhaps a third of surviving charters, now exist in the original; most are found in copies of various kinds, especially in cartularies. Historians need to test the authenticity of charters, both originals and copies of all periods, before making use of them. It was not uncommon for landowners, especially monasteries, to fabricate charter documentation to legitimize their possession of estates and rights. This was particularly frequently in the 12th century, when charters were used to defend ancient rights that had originated from gifts for which charters either had never existed or had been lost. Even when spurious such charters may be used with care by historians.

Chaucer, Geoffrey (ca. 1342–1400)

England's greatest nondramatic poet, whose superb poetry—often moving, sometimes disturbing, always immensely readable—gave a new direction to

Life

Chaucer was born into a London merchant family; by 1357 he was connected with the court, initially in the household of Elizabeth countess of Ulster, later in the service of successive kings. His wife, Philippa, was herself connected with the royal households of Elizabeth of Ulster, Queen Philippa, and Constanza of Castile, second wife of John of Gaunt; Philippa's sister, Katherine Swynford, was for many years Gaunt's mistress and eventually his third wife.

Chaucer made a number of journeys abroad on the king's business: to France on several occasions, apparently to Spain in 1366, and to Italy in 1372–73 and 1378, where he discovered the great literature of the Trecento. He held a number of senior “civil service” posts, including a controllership of customs (1374–85), the clerkship of the king's works (1389–91), and a deputy forestership in Somerset (1390s). He was a justice of the peace for Kent and represented the county in the parliament of 1386. Although there are numerous records of payments to him in both money and kind (clothing and wine) by Edward III, Richard II, and Henry IV, and to both himself and his wife by John of Gaunt, these are always in return for work or services; there is no mention of patronage specifically for his poetry.

Linguistic and Literary Backgrounds

Chaucer's life coincided with a turning point in the history of the English language. Under Edward III the dominant language spoken and written within the royal household was French, in its Anglo-Norman form; parliamentary proceedings were conducted in the same language. By the end of the century English predominated in court and parliament, and schoolboys were translating their Latin into English instead of French. Chaucer's poetry reflects, and encouraged, the new self-confidence of the language and contributed to the standing of the London dialect. His style combines specifically English features, such as alliterating phrases, with French flexibility of sentence structure and, increasingly, a spaciousness of syntax similar to that seen in the long complex sentences found in Latin.

Chaucer was familiar with English literary forms, including alliterative verse (cf. the sea fight in the Legend of Cleopatra, *Legend of Good Women* 635–48, and the tournament in the *Knight's Tale* 2602–16) and tail rhyme (parodied

in *Sir Thopas*); he probably knew Langland's work, and certainly Gower's. His earliest identifiable poetic models, however, were French. Most important was the 13th-century *Roman de la Rose* of Guillaume de Lorris and Jean de Meun, an allegorical love vision that Chaucer claims to have translated; of the three fragments of an ME translation that survive, only the first is likely to be his. It may be the earliest surviving example of his work. The *Roman* remained a key influence throughout his career, but his use of it changed significantly: his earlier poems draw most on Guillaume's account of falling in love in an idyllic courtly garden, while Jean's more cynical writing was an inspiration behind such characters as the Pardoner and the Wife of Bath. From the 1370s onward Chaucer was deeply influenced by Dante, Petrarch, and above all Boccaccio, and his poetry becomes increasingly cosmopolitan as he consciously participates in the highest western traditions of poetry. Like Dante and Boccaccio he presents himself following in the great classical line of Homer, Virgil, Ovid, Lucan, and Statius (*Troilus* 5.1792); of these Ovid was the most important to him. Other cultural traditions are represented in his work by his use of the 6th-century *Consolation of Philosophy* of Boethius, which he translated in the early 1380s, and, supremely, by his constant allusions to the Bible, the liturgy, and Christian doctrine.

Works

Chaucer's earliest known original poem, *The Book of the Duchess* (ca. 1368–72), was a response to the death of Blanche, duchess of Lancaster, first wife of John of Gaunt. It draws largely on French models and is written in a four-stress couplet form similar to French octosyllabics. Its narrator dreams of meeting a man in black who is mourning the death of his lady, named "White": the characters bear some relationship to Chaucer, the duke, and Blanche, but Chaucer's use of the dream form enables him to transcend historical circumstance to explore the contraries of love and loss, joy and grief. Three characteristics of the poem are notable as precursors of his later work. First is his exploitation of convention in unconventional ways: most strikingly in deaths invasion of the idyllic garden where the lover falls in love. Second is the sophistication of Chaucer's use of a first-person narrator. Despite his overdy muted role within the dream he is a figure for the poet; and since the dream takes place within his own mind, he is also the originator of the encomium and lament spoken by the man in black. Chaucer thus becomes the spokesman for the duke both in fact and within the structure of the poem. Third is its secular focus—a focus exceptional for elegy, but typical of the great majority of

Chaucer's works: Christianity is not denied, but the field of poetic interest is this world, not the next.

Chaucer's poetry of the 1370s and early 1380s continues to use French models—the *Roman*, Guillaume de Machaut, Jean Froissart—but Ovidian and Italian influences also appear. His major works of those years, whose order of composition is uncertain, are *The Parliament of Fowls*, *The House of Fame*, and possibly the *Knight's Tale* under the title of "Palamon and Arcite." *The Parliament* is probably Chaucer's earliest poem in the seven-line rime royal stanza, which he would later use in the *Troilus* and the tales of pathos in the *Canterbury Tales*. It may have been written for some particular occasion, possibly to do with Richard II's future wife, Anne. It is a dream poem that analyzes the various forms that earthly love can take, as illustrated by the claustrophobic temple of Priapus, inhabited by Venus, and by the hill of Nature, God's "vicaire" or deputy, before whom all the birds from the eagle to the goose have assembled on St. Valentine's Day to choose their mates. The poem suggests a series of contraries that it in fact refuses to endorse: both temple and hill are contained within the same walled park; inscriptions over the entrance promise bliss and threaten sterility and death, but the entrance is single; the birds that are given their mates and the three eagles that endure suffering and long service in love are alike under the aegis of Nature; the broader context for the dream is Scipio's vision, from Cicero, of the great cycle of the universe, with its injunction to serve the common good, while the dream itself shows the processes of natural regeneration within a single year—processes explicitly invoked in the concluding roundel celebrating the return of summer after winter.

The House of Fame is again a dream poem, told by a narrator-dreamer named "Geffrey" and written, like *The Book of the Duchess*, in octosyllabic couplets. The subject here is the nature of poetry, specifically the problem of recording the great deeds of the past—the function of narrative poetry—when the authorities who record those deeds are fallible. The problem is epitomized in the first section by setting the *Aeneid* against Ovid's account of Dido from the *Heroides*. In the third part it arises again in the form of quarrels among the various authorities for the story of Troy and in the description of Fame herself, whose apportionment of good or bad reputation or oblivion is shown as utterly arbitrary. The dreamer ends up in the house of Rumor, where truth and lies are inextricably jumbled and where there are no authoritative histories but only "tidynges" told by shipmen and pilgrims. The poem breaks off unfinished; the occasion for its composition is unknown, but in some ways it might be seen as foreshadowing the *Canterbury Tales*, with its substitution of fallible pilgrim narrators for an authoritative poet.

Troilus and Criseyde, of the mid-1380s, tells a story regarded in the Middle

Ages as historical, but Chaucer constantly stresses the impossibility of establishing truth. His main source, Boccaccio's *Filostrato*, is never mentioned (it is conceivable that he did not know who wrote it); instead he invents an authority named Lollius, to whom he appeals when he is in fact making up the story. The spare plot—of how Criseyde abandons her Trojan lover Troilus for the Greek Diomede—becomes in Chaucer's hands an elaborate work of over 8,000 lines, in poetry of an order unparalleled in earlier English, from its magnificent hymns to Love through the easy colloquialisms of conversation to the eroticism of the central book. The depth of thought in the poem results from Chaucer's setting this story from the unalterable past in counterpoint to arguments from Boethius's *Consolation* on destiny and free will and juxtaposing its theme of faithlessness against the providential ordering of the universe through "Love, that of erthe and se hath governaunce" (*Tr* 3.1744, *Consolation* 2.met.8).

The interpretations of *Troilus* over the centuries form an index to the varying responses to Chaucer: to his contemporaries it was most notable for its philosophy; the 15th and 16th centuries took it as a model of rhetorical eloquence; to the age of naturalism it was the first psychological novel; the search for values of the 1960s read it as a condemnation of inadequate secular goals; our own text-centered age stresses Chaucer's refusal to commit himself to motive, meaning, or fact. The God of the closing stanzas is the one fixed point, the unwritten author (Dante's "uncircumscrip, and al maist circumscrive," *Tr* 5.1865), but the protagonists, as pagans, cannot have access to him, and the questions they raise remain unanswered.

The reason, or excuse, that Chaucer gives for writing his *Legend of Good Women*, is that his portrayal of Criseyde provoked objections; in its dream prologue (extant in two versions) he describes how the God of Love and Alcestris, model of the faithful wife, commanded him to do penance by telling the stories of good women—in practice, wronged women. Nine stories follow, mostly drawn from Ovid's *Heroides*—of Cleopatra, Thisbe, Dido, Hypsipyle and Medea, Lucretia, Ariadne, Philomela, Phyllis, and Hypermnestra; the last breaks off in mid-sentence. It has generally been assumed that Chaucer found such writing to formula restrictive; his only similar assemblage of single-subject stories forms the *Monk's Tale*, which is interrupted by the restless pilgrim audience.

The *Canterbury Tales* (ca. 1387–1400) is a story collection that achieves the maximum variety within a unifying frame. The tales are told by a group of pilgrims journeying to St. Thomas Becket's shrine at Canterbury, and both the pilgrims and their tales are selected to give a cross-section of human and literary possibility. Each pilgrim represents a different profession or social estate, on the model of the satiric social analyses offered by medieval estates

literature. Chaucer's ideal figures, the Knight, Parson, and Plowman, mirror the basic tripartite division of society into those who fight, pray, and labor; the Clerk represents a fourth ideal, of those who learn and teach. The other portraits are more equivocal; Chaucer's persistent mode is superlative praise, but often aimed at the "wrong" attributes—the Friar's skill in begging, the Physician's financial success, the Prioress's social accomplishments. Women were often treated as an estate to themselves, and the one laywoman among the pilgrims, the Wife of Bath, is well capable of counterbalancing some 27 men.

The Host of the Tabard Inn, who accompanies the pilgrims as master of ceremonies, suggests that each pilgrim should tell four tales, competing with each other to tell "tales of best sentence and moost solaas"; the winning teller is to be given a dinner on their return to the Tabard. Whether or not Chaucer ever intended to write such an extensive work is unknown; he wrote only 24 tales within an incomplete framework. These stories are linked to form seven to twelve distinct fragments (the number is arguable); most editors opt for ten. There is some variation in the manuscript order of these fragments, but the most widely accepted order is that of the Ellesmere manuscript of the *Tales*, copied shortly after Chaucer's death:

- I. *General Prologue; Knight's Tale* (a high-style romance based on Boccaccio's *Teseida*, of the love of Palamon and Arcite for Emily); *Miller's Tale* and *Reeve's Tale* (rival fabliaux in which one Oxford student seduces one woman, and two Cambridge students have sex with two); the fragmentary *Cook's Tale* (of a London reveler condemned by a battery of proverbs).
- II. *Man of Law's Tale* (the trials and miraculous preservation of Custance, taken from Nicholas Trevet's *Cronicles* but treated as a pious romance).
- III. *Wife of Bath's Prologue* (a defense of marriage against the hostile clerical establishment, especially St. Jerome, in the guise of her autobiography); her *Tale* (the folktale romance of the knight who has to discover what women most desire); *Friar's Tale* (an elaboration of a preaching exemplum, of a rapacious summoner carried off by the Devil); *Summoner's Tale* (a fabliau of a scatological bequest to the friars).
- IV. *Clerk's Tale* (from Petrarch's version of Boccaccio's story of Patient Griselda); *Merchant's Tale* (a fabliau given high-style treatment, of the blind old knight January, whose sight is restored as his wife commits adultery in a pear tree).
- V. *Squires Tale* (an unfinished romance of magic gifts and an abandoned falcon); *Franklin's Tale* (described as a Breton lay though actually

adapted from Boccaccio, of a suitor who fulfills his lady's supposedly impossible condition to remove the rocks that threaten her husband).

- VI. *Physicians Tale* (Livý's story of Virginia and the unjust judge, taken from the *Roman de la Rose*); *Pardoners Prologue* (on his methods of extorting money) and *Tale* (presented as a sample homily and including the widely disseminated tale of three rioters who find death in the form of gold).
- VII. *Shipmans Tale* (a fabliau apparently once assigned to the Wife of Bath, of an adulterous wife and a monk); *Prioress's Tale* (a miracle of the Virgin concerning a boy murdered by the Jews); two tales told by the pilgrim Chaucer that effectively write him out of the competition, *Sir Thopas* (a parody of popular romance) and the prose *Melibee* (Prudence's discourse on the need for reconciliation, translated from a French version of Albertanus of Brescia); *Monk's Tale* (the falls of great men from biblical, secular, and contemporary history); *Nuns Priest's Tale* (the beast fable of the cock and the fox).
- VIII. *Second Nun's Tale* (the life of St. Cecilia, written earlier and incorporated into the *Tales*); *Canon's Yeomans Tale* (the autobiography of an alchemist's assistant and an account of alchemical frauds).
- IX. *Manciples Tale* (of Phoebus and the crow, from Ovid's *Metamorphoses*).
- X. *Parsons Tale* (a prose penitential tract epitomized from Latin treatises); Chaucer's *Retractions* (which combines recording the canon of his works with revoking "worldly vanitees").

The various tales cover most possible source areas (prose and verse, classical and contemporary, English and continental, sacred and secular), five prosodic forms besides prose itself (couplets, rime royal, tail rhyme, the eight-line *Monk's Tale* stanza, and the virtuoso rhyme scheme of the *Clerks Tale* "Envoy"), most available genres, and a wide range of rhetoric and style. Each tale also gives a distinct moral and linguistic reading of the world and humankind's goals within it, often appropriate to its teller, in a way that makes the whole work resistant to univocal interpretation.

Chaucer's shorter poems and *balades* are a mixture of serious and playful love poems, addresses to friends, patrons, and a scribe, and moral and religious pieces. Together with the Dantesque prologues to the *Prioress's Tale* and the *Second Nuns Tale*, his strongest expressions of Christian devotion are *An ABC to the Virgin* (adapted from Guillaume de Deguileville's *Pèlerinage de vie humaine*) and the *Balade de Bon Conseyl*, also called "Truth." A longer fragmentary poem, *Anelida and Arcite*, is notable for its technical experimentation. Chaucer also wrote what is possibly the first English vernacular textbook, the *Treatise on the Astrolabe*; a second, *The Equatorie of*

the Planetis, may also be his. Further works were falsely attributed to him in the 15th and 16th centuries, among them some antiecclesiastical works that gave him a reputation as a proto-Protestant.

Dissemination and Influence

No manuscripts of Chaucer's works survive from his lifetime, but they were widely copied throughout the 15th century. The *Tales* survives in some 80 manuscripts, *Troilus* in sixteen, *The Parliament* in fourteen, *Anelida* in thirteen, *The Book of the Duchess* and *The House of Fame* in three. The *Tales* was among the first books printed by Caxton, and ever-expanding editions of the complete works appeared from 1483, notably Thynne's (1532), Stows (1561), and Speght's (1598, the first to contain a glossary). Chaucerian scholarship effectively began with Tyrwhitt's edition of the *Tales* (1775–78).

Chaucer's influence made itself felt from his own lifetime. It may show in works by his contemporaries Froissart, Oton de Grandson, and Gower, though the direction of the influence is unclear. Lydgate and the "aureate" poets of the 15th century owed an explicit debt to him, usually phrased in terms of his mastery of rhetoric. Some of the major works of early Scottish literature, such as *The Kingis Quair* and Henryson's *Testament of Cresseid*, would have been impossible without him. Numerous poets, including Bokenham, Hawes, and Skelton, praised the poetic trinity of Chaucer, Gower, and Lydgate. He was the leading model for poetry throughout the 16th century, not least for Spenser, until the Elizabethan poets established their own standards of excellence. His preeminence has never been in question; he is the only ME author to have been read and praised in an unbroken tradition. There have been many adaptations and modernizations of his work, including samples by Dryden, Pope, and Wordsworth. His unique combination of accessibility and depth is indicated by his being the only poet to figure frequently both in British primary school teaching and as a key example in modern critical theory, and, in Pasolini's *Canterbury Tales*, as a box-office hit.

Chaucerian Apocrypha and Imitations

English poetic works misattributed to Chaucer in the 15th and 16th centuries; poetry and prose associated with Chaucer by scholars in the late 18th and 19th centuries; those poems whose style imitates that of genuine Chaucerian poetry.

In the centuries following his death in 1400 Chaucer's poetic influence was widespread. Many poets paid homage to the master by imitating his style. Indeed Chaucer's rime royal stanza, dream-vision allegory, and emphasis on love were particularly appealing to such well-known poets as Gower, Lydgate, and Hoccleve, as well as to minor English Chaucerians (Ashby, Bokenham,

Bradshaw, Burgh, Norton, Ripley, Usk, Walton) and to the so-called Scottish Chaucerians (Gavin Douglas, William Dunbar, Robert Henryson, James I). Because these poets followed Chaucer's style, many of their works were wrongly attributed to him and came to constitute a substantial part of the Chaucerian apocrypha.

The apocrypha consist of three spurious *Canterbury Tales* (the *Tale of Beryn*, the *Tale of Gamelyn*, and the *Plowmans Tale*), Thomas Usk's *Testament of Love*, and about 100 miscellaneous poems concerned mainly with love and courtesy. Several works once considered apocryphal—*Against Women Unconstant*, *Complaynt D'Amours*, *A Balade of Complaint*, *A Complaint to His Lady*, *Merciles Beaute*, *Proverbs*, *To Rosemounde*, *Womanly Noblesse*, and part of the *Romaunt of the Rose*—are now accepted as Chaucer's.

Most of the poems of the Chaucerian apocrypha may be divided into two general groups: short, mannered lyrics, such as *To My Sovereign Lady*, employing the literary conventions of courtly love, in which the poet languishes before an obdurate lady, and the "dits amoureux," more formal narratives like *La Belle Dame sans Merci* and *The Court of Love*, which depict complicated love adventures in a courtly setting. These forms, evolving from the 15th-century interest in Chaucer as the poet of love, influenced Wyatt and Surrey on the one hand and Spenser on the other.

One of the first to ascribe apocryphal works to Chaucer was John Shirley, a 15th-century English manuscript copyist and bibliophile who collected and compiled works by Chaucer, Lydgate, and others. At the beginning of two of his collections, perhaps in an effort to increase their value, Shirley attaches lists of contents, and here he attributes many minor poems, such as "The Nine Worshipfullest Ladies," to Chaucer.

Though Shirley was the main contributor to the late-15th-century development of Chaucerian apocrypha, several other manuscripts, most notably Cambridge, Trinity College R.3.19, also contain minor works that came to be linked with Chaucer's name. Some of these manuscripts were the printers' copy for the 16th-century black-letter editions of the poet's works and were later used by editors of Chaucer from the 18th century on.

In 1526 Richard Pynson added five non-Chaucerian pieces to his edition of Chaucer, including *La Belle Dame sans Merci* and *The Lamentation of Mary Magdalene*. William Thynne appended 23 apocryphal works to his 1532 edition of Chaucer, nineteen of which appear for the first time in this edition. Among them are the earliest extant text of Henryson's *Testament of Cresseid*, Lydgate's *Flower of Courtesy*, and the only surviving text of Usk's *Testament of Love*. Finally, in his 1542 edition, Thynne added another important apocryphal item, the *Plowmans Tale*, a debate poem on ecclesiastical authority that had already been published and attributed to Chaucer by Thomas Godfray (ca.

1535).

In 1561 John Stow, a London antiquarian who had come to own many of the Shirley manuscripts, printed an edition of Chaucer that included Thynne's addenda among the genuine poems of Chaucer. Stow himself added some 23 pieces, most of them apocryphal, including *The Craft of Lovers* and *The Court of Love*. Thus by 1561 there were some 50 works in the apocrypha.

During the 16th, 17th, and 18th centuries only a few more pieces were added to what had by now become the main corpus of Chaucerian apocrypha. In 1598 Thomas Speght essentially reprinted Stow but added some well-known apocryphal poems: *The Prisoner's Complaint Against Fortune*, *The Flower and the Leaf*, *The Isle of Ladies*; in his 1602 edition Speght also included *Jack Upland*, first published and attributed to Chaucer ca. 1536. Later, in John Urry's 1721 edition of Chaucer, two further apocryphal works appeared in print, the *Tale of Beryn* (a comic tale) and the *Tale of Gamelyn* (a romance).

During the 19th century editors, including Walter W. Skeat and Frederick J. Furnivall, examined the Shirley and Stow manuscript collections and included among the apocrypha such poems as the *Plowmans Song* and the *Balade of a Reeve*. But Skeat's important edition of the apocrypha, *Chaucerian and Other Pieces* (1897), retains only 29 of the "most important" items and clearly labels them as non-Chaucerian.

Chichele, Henry (1362–1443)

Archbishop of Canterbury (1414–43), statesman, diplomat, and benefactor. Born in Higham Ferrers, Northamptonshire, he belonged to a merchant family with London connections. Educated at William of Wykeham’s new colleges at Winchester and Oxford, he specialized in canon law and by 1396 was practicing in the Court of Arches in London, where he was rector of St. Stephens, Walbrook. He became a member of the staff of Bishop Mitford of Salisbury and was rewarded by him with many benefices.

By 1404 Chichele had moved to royal service and was, in that year, appointed the king’s envoy to the Roman curia. He served as Henry IV’s proctor there again in 1406 and thereafter was often employed as a diplomat, four times meeting the French and once the Burgundians. In 1408 he was sent to Siena as envoy to Pope Gregory XII and while there was consecrated, on the king’s nomination, as bishop of St. David’s (Wales). His new status and his diplomatic skill made him an obvious choice as colleague of Bishop Hallum at the Council of Pisa in 1409.

Chichele continued as a prominent diplomat for the remainder of Henry IV’s reign and on the death of Archbishop Arundel in 1414 was Henry V’s choice as archbishop of Canterbury, as much for his connections with London and Oxford as for his public service. Chichele repaid the trust in his support for the king’s policy in France.

Overshadowed by Cardinal Beaufort, he remained a supporter of the conciliar movement for a more representative church and was no friend of Pope Martin V. His concern for education was shown in his promotion of graduate clerks, his fund for poor scholars at Oxford, and provision of a site for St. Bernard’s College there. A traditional churchman, he opposed Lollardy and established religious foundations at Higham Ferrers and Oxford, the latter the

Chichester Roundel

On the south wall of the chapel of the Bishop's Palace at Chichester a quatrefoil medallion about 32 inches in diameter encloses the image of the Virgin Mary tenderly embracing the Christ Child while two angels emerge from clouds at the sides swinging their censers. This painting, dating about 1250–60, proclaims its royal nature in both form and material. The Virgin is portrayed as the queen of heaven with all the accouterments of earthly majesty, the jeweled crown, the scepter, the eagle throne, and the royal fleur-de-lis both embroidered on her fur-lined mantle and powdering the background. Furthermore the artist used only the finest materials, gold, silver (now oxidized), and an expensive blue pigment for the background, all of which clearly set this work apart from ordinary wall paintings of the period. In style and iconography the Chichester Roundel has most frequently been compared with images of the Virgin and Child by the monastic illuminator Matthew Paris of St. Albans, who had ties to the court of King Henry III, but wall paintings recently uncovered at the Benedictine priory of Horsham St. Faith (Norfolk) are even closer in their sophistication and refinement.

Children and Childhood

Childhood was defined in several ways in medieval England. Common law saw it as the period from birth to twelve, when the young person became legally responsible for criminal acts. The law presumed that by twelve the culprit would have an adult understanding of the wrongfulness of his or her action. In canon law the age of marriage was twelve for girls, fourteen for boys.

Writers like Isidore of Seville and Bartholomaeus Anglicus divided childhood into two periods: *infantia* was from birth to seven, *pueütia* from seven to fourteen. Physicians were inclined to extend childhood to the late twenties, as were some of the poems on the ages of man. In more common parlance the terms "infant," "child," and "baby" covered a range of ages into the twenties.

The practical experience of childhood seems to have been marked by two major transitions, the first around age seven, the second around twelve or fourteen. The first year of life was taken up with baptism and then with the usual problems of feeding, clothing, and tending to the child. This first year was the most dangerous, with perhaps as many as 50 percent of the children succumbing to fatal illness; no evidence of widespread infanticide appears in any medieval English records. The children were swaddled during the first year and spent much of their time in a cradle near a hearth. Breastfeeding, supplemented with prechewed bread and perhaps ale, was the most common form of sustenance. Peasant and urban dwellers fed their own children, but noble women often used a wetnurse.

By the second and third years children learned to walk, play, and talk with the help of parents or nurses. During these years they also began to show an identification with the roles their parents played. Thus, among peasant children, accidental deaths indicate that young girls died imitating their mothers' daily activities, while young boys followed their fathers outside. Most

of the training of children between birth and seven was the responsibility of mothers or female nurses.

By seven children had developed sufficient motor control and responsibility to move on to new activities; play began to resemble the activities of adults. Noble children might enter a period of fostering, while peasant children began to help with tasks around the house or with herding. Urban children also began to help around the house and to participate in some economic activities, such as running errands. Formal education also began at this age. Play still remained a large part of their lives but might now be directed toward supplemental economic activities, such as fishing.

By age twelve to fourteen children began to move into the adolescent phase, when they would expect to undertake more serious training for adult lives. They were old enough to become apprentices in trades and crafts, to do field work but not plowing (if peasants), to become squires (if noble). Girls learned the appropriate female counterpart activities. Peasant children tended to remain with their natal family to learn the skills of husbandry and domestic activities, while urban children moved to the house of an employer, if servants, or to a master, if apprentices. Noble boys learned the use of arms and other matters necessary for their future role at this age, and noble girls learned domestic skills. While they could also marry at these ages, child marriages were uncommon except among the nobility and for young heiresses in urban centers.

Exit from childhood into *adolescentia* could be marked by changing residence from the natal home, by service or apprenticeship, by entering training for the clergy, or by going to university. The period of adolescence was universally one of intensive training. Various changes in status marked the end of adolescence: inheritance (fourteen for heiresses, 21 for men in common law and 21 or more in customary law), marriage (perhaps late teens for women and twenties for men, depending on social class and current economic opportunities), knighting (21 was typical but could be earlier), entrance into clergy (seventeen for ordination as a subdeacon, nineteen to become a monk, and 24 to become a priest), or becoming a mastercraftsman or setting up an independent business.

Chivalry

Chivalry was the culture that grew up around knights and their feats of arms. According to ecclesiastical writers there were two sides to knightly service: defense of fellow men and of the church.

From a military view, long before the advent of this concept of chivalry, the Bayeux Tapestry (late 11th century) already depicts horsemen charging with couched lances, as well as throwing their spears in traditional fashion. This new technique, and the plate armor developed in response to it, dramatically changed the character of medieval warfare.

In the late Middle Ages the knight was a powerful mobile projectile. He had to develop and perfect skills in handling the sword and lance; he also had to learn to act as part of a small team (*banniere*) under his lord, where the ability to disperse and regroup were vital. It was to promote these skills that Richard I defied a papal ban and licensed four tournament sites in England in 1194. The line between war and tournament was fine—witness the often fatal chivalric encounters in Scotland and France in the 14th century. By ca. 1400 the tournament between teams of knights had been largely superseded by the joust, often in the elaborate dramatized framework known as the *pas d'armes* (as at St. Inglevert in 1389, described by Froissart) and announced by complex and fantastic challenges.

Throughout Europe knightly consciousness was heightened by the dissemination of literature, especially Arthurian romance, inculcating the values of knightly devotion (especially to a lady), fortitude, and loyalty. This code was epitomized by such knights as Edward III's cousin Henry duke of Lancaster (d. 1361) or his own son Edward the Black Prince. Edward I and Edward III both exploited Arthurian associations and sustained their chivalric

reputations by victories in the field, arbitration over individual combat, patronage of tournaments, holding baronial meetings at round tables, and jousts. Their courts were a focus for foreign knights.

From the 11th century until the fall of Acre (1291) the Crusades in the eastern Mediterranean had been an important focus for chivalric aspirations and energies. The 14th century undoubtedly witnessed a shift toward a more secular expression of the knightly ideal. In 1348 Edward III, fresh from victories in France, founded the Order of the Garter. For 24 knights of unblemished honor the Order bound individual loyalty to the service of king and infant nation-state.

War and tournament had always offered opportunities for profit and social advancement, especially welcome to the impoverished younger sons of noble families, such as William Marshal (d. 1219). In the 14th and 15th centuries profits from the Hundred Years War financed many forms of chivalric display, such as the building and furnishing of castles, collegiate churches, and chantry chapels. Heraldry was perhaps the supreme outward expression of chivalry.

Nevertheless, these men would have identified with the knight of Chaucer's *Canterbury Tales* and seen the defense of the church as an important responsibility, for they continued to crusade in northeast Europe into the 15th century. The journeys of Chaucer's Knight were roughly paralleled by or modeled on the early military exploits of the young Henry IV (as Henry Bolingbroke, earl of Derby).

Choirs, Choral Establishments

During the Middle Ages and early Renaissance the choirs of the major ecclesiastical institutions, while constituted primarily to enact and render the plainsong of the liturgical service, provided English composers with their principal medium of performance for written polyphony. The choral forces themselves were of many diverse constitutions, origins, and natures but were united in their observance of a roughly common liturgy; and in the absence of any widespread cultivation of secular polyphony they provided the milieu for virtually all serious musical enterprise and endeavor.

Throughout western medieval Christendom the monastic ideal of the maintenance of a continuous web of worship and praise, in imitation here on earth of the hosts of heaven above, motivated religious communities of men and boys, and of women, to observe and offer within the churches built for their special use a daily liturgy that was of immense complexity, composed of three principal constituent elements: ceremony, text, and the unadorned monodic plainsong chant to which the text was sung. The monastic restoration of the second half of the 10th century added to the existing communities of secular clergy a network of major ecclesiastical centers dedicated to the full liturgical panoply of the Cluniac revival. The greatest of the monastic institutions, whether of the Benedictine or (from the 12th century) of the Augustinian or Cistercian orders, soon maintained large communities. Only in moments of crisis did the community of Christ Church, Canterbury, ever fall below 80 monks, and of Durham below 70; some 20–30 other houses maintained around or in excess of 40 members, and a fair number of the greater nunneries sustained some 20–30 or more. In monasteries and nunneries the community at worship was the choir, and thenceforward until the Dissolution of religious houses under Henry VIII these bodies of nonprofessional and not necessarily particularly expert bodies of men (with, until around the middle of the 12th century, oblate boys) and women observed daily the full musical rigor of the plainsong liturgy.

During the course of the 12th century the greatest of the communities of secular clergy, especially those of the cathedral churches, came to match in grandeur and resources the most prominent of the monasteries and could endeavor to emulate the elaboration of their manner of celebrating the liturgy. Originally the principal clergy of such a church were the canons, in addition to the chorister boys of the choir and in some cases some junior clerks intermediate between them. The number of canons ranged from 24 at Exeter Cathedral to 56 (later 58) at Lincoln. During the 12th century the practice of nonresidence became well established; consequently the handful of canons resident was left fully occupied merely in administration of the cathedral and its personnel and estates. To acquit them in their choir duties, therefore, all the canons appointed substitutes. Ideally these “vicars choral” were men who

possessed singing voices and qualities of character sufficiently good to enable them to take the canons' places in choir and sing the services in their behalf; not always, however, was this ideal met.

In choir the vicars choral (plus the canons resident), junior choir clerks, and chorister boys were disposed by seniority in the three ranks required by the secular liturgies, as clerks respectively of the top, second, and third rows of stalls. Normally one of the vicars choral was appointed to be master of the choristers, to instruct the boys in Latin vocabulary and grammar and to coach them in the plainsong and ceremony of the liturgy. At full strength the choir of Hereford Cathedral, the smallest, consisted of 27 men and five boys; the largest were twice this size, that of Salisbury consisting of 52 men and fourteen boys, and of Wells 50 men and nine boys. Organized on lines similar to the choirs of the cathedrals were those of other collegiate churches, such as Beverley, Ripon, Southwell, Crediton, and St. Martin's le Grand in London. With 36 men and ten boys Beverley Minster more than matched the lesser cathedrals, but most in this class were on the smaller scale of, for instance, Southwell, with 20 men and eight boys. The clergy of a few of the greatest hospital foundations also observed the liturgy in a manner akin to that of the smallest collegiate churches, at least on holy days.

In essence the function of these ecclesiastical choirs remained unchanged throughout the medieval period. This was to recite and enact the text and ceremony of the liturgy—daily high mass and the office, the Lady Mass (from the 12th or 13th century onward), and the wealth of peripheral material—to its sung plainsong chant. However, the plainsong came in time to be supplemented by alternative ways of expressing the music of certain items, through the performance of polyphony, either improvised (e.g., discant) or composed. Until about the second quarter of the 13th century the performance of written polyphony may well have been cultivated only sporadically in England; thereafter it appears to have become a regular way of distinguishing certain services at the most prominent churches, most particularly the daily Lady Mass but also high mass and the greater hours on festivals. Until the early 15th century polyphony was composed within a narrow compass of two octaves realizable by men's voices. It was performed by ensembles of not more than four solo voices—indeed there is virtually no surviving music that could not be performed by the ensemble apparently akin to two altos, one tenor, and one baritone specified for the choral staff of the small collegiate chantry of St. Mary, Epworth (Lincolnshire), at its foundation in the 1340s. The principal centers for the composition and performance of polyphony at this time appear to have been the larger monasteries. Down to ca. 1350 music apparently survives from Benedictine houses so widely distributed as Bury St. Edmunds, Peterborough, Durham, Shrewsbury, Winchcombe, Worcester, St. Albans, and

Christ Church, Canterbury, and such Augustinian monasteries as Dunstable and Thurgarton. Nevertheless, it seems likely that until the second half of the 14th century there were never at any one moment more than about a couple of hundred people in England who understood the notation of polyphonic music and could compose and perform it; it remained an esoteric and exclusive art.

The late-medieval expansion in musical and choral endeavor within the English church appears to have begun in about the second quarter of the 14th century. At this time royalty and the royal aristocracy, eventually to be imitated by most of the peerage from the rank of earl upward, began so to organize their personal chapels of the household as to include, as well as priests, the clerks in minor orders and boys necessary to emulate the greatest of the secular religious communities in their manner of the daily observance of the liturgy. The Chapel Royal became an eloquent advertisement of the king's orthodoxy and of the quality of the executive musical talent available to him in the ordering of his daily devotions; from Edward III's staff of thirteen priests, four clerks and four or five boys it expanded under Henry V to a large organization of 32 priests and clerks and sixteen boys. The prestige, salaries, and fringe benefits offered by the courts of (eventually) some twenty royal and aristocratic households enabled them to attract the ablest singers. In addition, by the end of the century, the two archbishops and many if not most of the fifteen bishops likewise maintained fully staffed household chapels.

At the same time royalty, the peerage, and the episcopacy emerged as founders of a spate of new collegiate churches, created essentially to be their perpetual chantries, of which the richest were established from the start to be major choral foundations. They include, for instance, Edward III's St. Georges, Windsor, and St. Stephens, Westminster (1348), each with a choral staff of thirteen priests, four clerks, and six choristers, and Henry VI's Eton College (1440: ten, four, sixteen) and Kings College, Cambridge (1441: ten, six, sixteen); the earl of Arundel's Holy Trinity Arundel (1380: thirteen, four, six), the lord la Warre's St. Mary Manchester (1421: eight, four, six) and the duke of York's St. Mary Fotheringhay (1415: twelve, four, thirteen); St. Mary's, Winchester (1392: thirteen, three, sixteen), and New College, Oxford (1392: ten, three, sixteen), founded by William of Wykeham, bishop of Winchester; and All Saints Maidstone (1395: twelve, four, eight) founded by William Courtenay, archbishop of Canterbury—to name but a few of the 30 or 40 founded by ca. 1500. It was especially in these household chapels and major chantry colleges of the secular and ecclesiastical aristocracy that the value of polyphonic music in distinguishing the services on a regular, commonly even daily, basis came to be recognized. The Old Hall Manuscript, compiled ca. 1419–20, contains a large repertoire of polyphony for high mass and/or Lady Mass on all classes of day down to the least significant and may have been written for the household

chapel choir of Thomas duke of Clarence. To render such music, as the 15th century progressed, the profession of career lay singer emerged; the minor-order clerkships of the second form came increasingly to be filled by professional singers, called “lay clerks,” offering specific expertise in polyphony. Nevertheless, prior to ca. 1450, few institutions allowed for more than four or six of these; solo performance was still the predominant medium for the settings of the Ordinary of the mass, motet, and votive antiphon that were the principal vehicles for polyphonic expression at this time.

Another manifestation of the zeal for enhancing the musical component of the liturgy at this time is offered by the creation at the major monastic churches of Lady Chapel choirs. At the time these consisted of just a team of boys (drawn normally from the boys of the Almonry grammar school) and a lay professional musician (commonly entitled cantor) to train them. The choir of boys attended daily in the Lady Chapel to sing the plainsong of the Ordinary of the Lady Mass; the cantor was available also to train the monks in chant and improve the standard of singing in the monks’ choir. Such choirs, usually of only six or eight boys, were established at, for instance, Westminster Abbey (by ca. 1395), Winchester (1402), Ely (1404), Durham (1416), Abingdon (by 1420), Malmesbury (by 1420), and Christ Church, Canterbury (1437); by 1500 they were to be found at most of the major Benedictine and Augustinian, and some Cistercian, houses.

During the second half of the 15th century there occurred the transformation of the choral force of the major cathedral and collegiate churches from its medieval to essentially its modern form. The catalyst appears to have been the rising importance of the enhancement of the service by the regular performance of written polyphonic music, performed no longer only by adult soloists but also by the full chorus in settings with a compass of three octaves requiring the voices of boys as well as of men, normally in a five-voice disposition of treble, alto, two tenors, and bass. This provoked the transformation of the liturgical choir from an inchoate body of individual singers of plainsong (of whom only a few specialists among the men undertook to sing written part music) to a balanced choir of men and boys, trained by a recognized director to render in common enterprise the performance of settings of polyphony—especially of the Ordinary of the mass, Magnificat (at Vespers), and the votive antiphon. In the largest choirs this was fully compatible with a fall in the number of men (at Salisbury, e.g., from 50 to 30 between 1450 and 1500 and at Lincoln from around 40 to 26), creating a manageable balance with the boys. In other choirs the number of boys had to be increased to balance with the men, as at Tattershall College (from six to ten) and at Lichfield (from eight to twelve). Others were more broadly expanded simply to increase the size of the chorus; Edward IV refounded the choir of St.

Georges Windsor (1476–82) to stand at sixteen priests, thirteen lay clerks, and thirteen choristers, proportions that eventually became a model for many others.

Provided that a working balance for five-part music (SATTB) could be deployed, choirs did not need to be large to be effective, and so the performance of choral polyphonic music, alongside the traditional plainsong of the liturgy, was adopted at a wide variety of ecclesiastical institutions. To augment the voices of the chaplains and establish a full chorus, boys' choirs were created at such collegiate churches as Mettingham (fourteen boys) and Rushworth (seven boys), originally founded without places for choristers. Conversely men's voices had to be found to fill out the monastery Lady Chapel choirs, originally founded for boys alone. At Worcester Cathedral and Christ Church, Canterbury, competent monks were associated with the Lady Chapel boys; elsewhere, as at Glastonbury and Gloucester, a few lay clerks were taken into employment. Meanwhile, at the wealthiest of the city and urban parish churches also, professional choirs on secular collegiate models began to be recruited. These bore no resemblance to the amateur parish church choirs of today; rather they were financed normally by one or more religious fraternities of the devout and wealthy laity of the parish, who contributed to the cost of a professional organization. Notable examples of which records survive include the choirs of several of the London parish churches, such as St. Michael Cornhill and St. Mary at Hill, of the parish churches of Ludlow (Shropshire) and of Louth and Boston in Lincolnshire, St. Lawrence Reading, All Hallows Sherborne, and All Saints Bristol. The chapel personnel of some long-established hospital foundations were modernized and reorganized as professional choirs, as for instance at St. Cross Winchester (six chaplains, six clerks, six choristers), St. Katherine's London (three, seven, six), St. Antony's London (four, eight, six), and St. Mark's Bristol (four, six, ten).

The involvement of boys' voices in the performance of written polyphony from ca. 1450–60 onward was an innovation, and their training now required special skills and competence on the part of their instructor. The post of master of the choristers came to be filled by well-paid lay professional musicians, very often employed also as organ players, who filled *de facto* the role of director of the whole choir; commonly each was also a composer contributing to the stock of polyphonic music in circulation. The proliferation of choral establishments resulted in no concentration of the craft of composition in one place (e.g., at court) but rather in a healthy dispersal around the country.

By the end of the 15th century it was commonly required of not only the boys and lay clerks of choral establishments but of many of the priests and chaplains also that they be competent to contribute to the performance of polyphony, ensuring the full choral sound that ever since has been the

hallmark of the English church choral tradition. Indeed, by ca. 1500, at institutions ranging from the Chapel Royal and the household chapels of the aristocracy, through monastery Lady Chapels and collegiate and parish churches possibly numbering close to 200 in all, professional choral endeavor—doubt less of diverse quality—had come to constitute an honorable professional occupation for the large number of men and boys now appropriately employed, trained, and educated, and a vehicle making possible both the conception and the performance of a body of elaborate music—the virtuoso polyphony of such composers as John Browne, Robert Fayrfax, and Walter Lambe—of the highest quality and lasting value.

Christ and Satan

The fourth and final poem in the Junius Manuscript of OE poetry. In contrast to the preceding poems, which are all concerned with Old Testament themes, *Christ and Satan* covers the whole span of biblical history and recounts a series of conflicts between Christ and Satan.

The poem can be divided into three sections. The first part (lines 1–365) consists of a series of complaints by Satan and the fallen angels, condemned to hell after their unsuccessful revolt. Unlike the two treatments of the Fall of Angels in *Genesis A* and *Genesis B* earlier in the Junius Manuscript the rebellion in *Christ and Satan* is depicted as specifically directed not against God the Father but against Christ the Son, the first of a series of conflicts in heaven, in hell, and on earth that make up the rest of the poem. The second section (lines 366–662) gives an account of the Resurrection, Ascension, and

Last Judgment but focuses on Christ's Harrowing of Hell and overthrow of Satan in his own domain. The third section (lines 663–729) provides a brief but graphic account of Satan's temptation of Christ in the wilderness.

Throughout the poem emphasis is placed on the power of Christ and the powerlessness of Satan, who appears in this poem as a much more abject and pathetic figure than, for example, in *Genesis B*. A number of the motifs in the poem, such as Satan bearing Christ on his shoulders, or being condemned to measure the extent of hell with his own hands, are unparalleled and may be the innovation of a poet who, though lacking the force and vision of a Cynewulf (to whom the poem was once attributed), could still bring considerable and unorthodox sophistication to his work.

Christ I

The three opening poems of the Exeter Book, once believed to constitute a single work by Cynewulf on the life of Christ, are now commonly

distinguished by the titles *Christ I*, *Christ II*, and *Christ III*. Although opinion continues to vary on whether and how the poems are structurally and thematically unified, they are usually seen as independent works and are almost certainly not the work of one author (though the attribution of *Christ II* to Cynewulf remains secure).

Christ I, also known as *Advent* or the *Advent Lyrics*, survives as a series of twelve intricate lyrics of varying length that amount to 439 lines. Ail save the first lyric, whose opening is lost, begin with the hortatory injunction *Eala* (“O!” or “Lo!”) and address a person, place, or attribute associated with Christ in the Advent liturgy. Together the poems develop a series of themes that illustrate the movement from Advent to Christmas: Lyrics 1–10 dramatize the church’s sustained anticipation of Christ’s Advent, Lyric 11 brings the progression to an emotional climax in-praising the Trinity for the Nativity that has now taken place, and Lyric 12 resolves the sequence by celebrating the miracle of the Virgin Birth and counseling humanity to honor God and seek his eternal reward. Lyric 7 (*Eala ioseph min*, “O my Joseph”) is particularly well known as an early expression of the iconological motif of the “doubting of Mary,” a revelation of Joseph’s anguish and consternation over the pregnancy of his supposedly virgin bride.

The first ten of the twelve lyrics owe their themes and much of their imagery to a group of Latin antiphons that in the medieval Roman church were chanted at Vespers on the days during Advent called the Greater Ferias, from 17 December to 23 December. These antiphons, compiled over time from an early collection of seven *antiphonae maiores*, or “Great O” antiphons, and from a later group of “monastic” or “additional O” antiphons, all begin with the Latin invective ‘O’ and were conventionally sung once before and once after the gospel canticle known as the Magnificat (Luke 1:39–55). Of the two lyrics that do not clearly follow this pattern, one (Lyric 11) has no single widely accepted source and the other (Lyric 12) is adapted from an antiphon for Lauds on the octave of Christmas (January 1). The repertoire of antiphons available to the poet was evidently unique in that the number, order, and selection of antiphons after which the antiphons were patterned are without parallel in any extant chant books, insular or continental. Comparison with surviving collections of Latin antiphons also makes it likely that the poet originally wrote fifteen lyrics and that the first three are now lost along with the opening of Lyric 1. Because the antiphons known to the poet derive almost uniformly from Roman (rather than Gallican or insular) liturgical tradition, it is possible to speculate that the lyrics were composed well before the third quarter of the 10th century, when Roman liturgical customs in English use began to be supplanted by Frankish and Lotharingian ones in the wake of the Benedictine Reform. Together with their great lyrical power the poems’ subtle

reliance on biblical and patristic learning marks them as the most sophisticated examples of liturgical poetry in OE.

Christ III

The third poem of the Exeter Book, *Christ III*, once but no longer attributed to Cynewulf, is a dramatic 798-line account of Doomsday representative of a rich tradition of Anglo-Saxon penitential and eschatological literature. While the marvels it describes follow no clear sequence and are occasionally repeated, the poem's governing theme is that Judgment will take place at midnight on Mount Sion accompanied by a series of tumultuous events. Angels will blow trumpets from the four corners of the earth, the heavens will split asunder, the

stars and moon will fall from the sky, the sun will turn to blood, and fire will ravage the earth as Christ appears in glory in the southeastern sky and displays his wounds. Dead bodies will rise from their graves and take on new flesh as they are reunited with their souls. The Cross will appear in the heavens, shining brilliantly through the stains of Christ's blood, and will then direct each man to come before the Lord to be judged. The thoughts, words, and deeds of each man will then be openly revealed as his flesh becomes like glass. Christ will accordingly separate the just from the unjust, casting the wicked into the depths of everlasting torment while the elect pass blissfully into the communion of angels. In a long speech that follows Christ comforts the blessed and reminds them of their good deeds while he abjures the wicked for neglecting his commandments. After a moving call for introspection and repentance in anticipation of God's judgment upon all humankind at the end of time the poem then closes with a rhapsodic description of the joys of heaven.

In addition to the biblical sources for many of these details the poem adapts its imagery and bold theology from a range of patristic texts, including Gregory the Great's *Moralia in Job* and two sermons by Caesarius of Arles, with more distant echoes of works by Ephraim Syrus and Bede. Several unusual motifs, such as the location of Judgment on Mount Sion and its occurrence at midnight, the bleeding of the trees at Christ's Passion (perhaps modeled on 4 Esdras 5:5), and the burning of the seas like wax, have close and extensive parallels only in Irish and Hiberno-Latin literature and may therefore align the poem with a distinctively insular tradition of eschatology.

Chrodegang of Metz (d. 766)

Frankish clerical reformer. Born of a noble Frankish family, Chrodegang spent his early career in the Frankish court, where he was chancellor or "keeper of the seal" for Charles Martel. Later appointed bishop of Metz (742) and then archbishop (754–55), Chrodegang sought to enact reforms in several major areas, notably clerical life and liturgy, but he was also active in building campaigns, founding such important monasteries as Gorze (where he was buried in 766), Lorsch, and St. Avoird. In many ways Chrodegang was a true successor to Boniface, the Apostle of Germany, and both shared a deference to Rome for practices and customs.

In Anglo-Saxon England Chrodegang's *Regula canonicorum*, or *Rule for Canons* (755), had a major impact. The original document had 34 chapters, later greatly expanded, that sought to establish a community life for clergy at a cathedral. Later versions included chapters taken from the councils of Aachen (816) and Toledo (633). Under the *Rule* cathedral clergy were not bound to poverty but lived a quasi-monastic life. Chrodegang borrowed from the Benedictine Rule but changed several things. Most obviously the bishop replaces the abbot. Chrodegang also regulates severely what Benedict saw as hospitality and, because there is no hospice at the cathedral, had to make other rules for treating the sick. The enlarged *Rule* appears in Cambridge, Corpus Christi College 191, which offers 84 chapters in Latin and OE, and partially in three other manuscripts.

Scholarship has thus far only suggested the importance of Chrodegang's *Rule* in Anglo-Saxon culture. Trahern has seen links between Chrodegang and the OE poem *Vainglory*, while recent conference activity, as yet unpublished, has explored gender adaptations of the Benedictine Rule in connection with Chrodegang. The tension between monks and clerics, as evidenced by Æthelwold's expulsion of the clerks from the Old Minster, Winchester, in 964,

may have more to do with Anglo-Saxon cultural forms than hitherto understood.

Chronicle Poems

Poems that appear at various points in the Anglo-Saxon Chronicle and mark the close of the OE alliterative verse tradition. They can be found in four of the Chronicle manuscripts: Cambridge, Corpus Christi College 173 (the Parker Manuscript), and BL Cotton Tiberius A.vi, Cotton Tiberius B.i, and Cotton Tiberius B.iv.

Despite the difficulties of multiple authorship and manuscript variations, if viewed as a collection these poems can be seen as moving over time from a traditional to an imaginative and erratic poetic style. The deliberate use of rhyme and irregular meter in the later poems is thought to link the OE and the ME verse traditions in its variation on the ancient and conservative poetic

formulas. At the same time, however, if the poems' purpose parallels that of the chronicle as a whole, they can be seen as artificially yet consciously privileging and preserving the older style for the sake of creating a national history and identity (Campbell 1938: 36–38).

The first chronicle poem is the longest, most conventional, and most famous: *The Battle of Brunanburh* (937). As opposed to the more somber *Battle of Maldon*, this is an “unrestrained song of triumph,” concerned not with details of the actual battle but with making the English armies into national heroes (ASPR 6:xi). It closely follows older forms of heroic poetry in style and language. The remaining poems include *The Capture of the Five Boroughs* (942), *The Coronation of Edgar* (973), *The Death of Edgar* (975), *The Death of Alfred* (1036), *The Death of Edward* (1065), and the *Rime of William* (1086). This final poem departs greatly from OE alliterative convention by using rhyme as the dominant poetic device, and it shows the most erratic meter. A thematic movement also takes place among the chronicle poetry, from celebrating English victory in the earliest poems to the reality of the oppression suffered by the English under the rule of William I.

Chronicles

Chronicles were the major source of historical information in the Middle Ages. Their primary function was therefore utilitarian rather than aesthetic, although

many of them are not devoid of literary merit. Their modern value lies partly in the historical information that they contain and partly in what they indicate regarding the historical, political, and cultural consciousness of their writers and compilers and of their medieval audience. In addition many chronicles are of linguistic interest, both inherently and as witnesses to the relative fortunes of the Latin, French, and English languages in medieval England.

Theoretically a distinction should be made between chronicles (prose or verse narratives that cover a considerable period of history) and annals (year-by-year accounts of significant events). In practice the two types frequently overlap or are combined in a single work, and no strict distinction is made in the present article. Similarly accounts covering relatively short periods of time or individual events are also considered here. It is also possible to regard narratives of ancient history (such as accounts of the siege of Troy), certain romances (such as those about Arthur), and many saints' lives as chronicle writings, but these are not considered here.

Anglo-Saxon Period

The earliest historical work written in the Anglo-Saxon period is Gildas's mid-6th-century *De excidio et conquestu Britanniae*; its historical intent, however, is superseded by its bitter homiletic attack on contemporary British decadence. A later Celtic work, similar to Gildas in its importance as evidence for the early development of the Arthurian legend, is the *Historia Brittonum*, attributed to Nennius. Although originally written in Wales in 829/30, Nennius's *Historia* became known in England in the 10th century, and it was influential on Geoffrey of Monmouth.

Quite different in approach is Bede's *Historia ecclesiastica gentis Anglorum*, which recounts the history of England from Julius Caesar to A.D. 731, the year of the work's completion, focusing on the conversion to Christianity. Bede's meticulous, well-documented methodology is similar in many ways to that introduced by Renaissance historiography. As a major historical source Bede's work is paralleled and supplemented by the versions of the vernacular Anglo-Saxon Chronicle, which have a common ancestor in a set of annals, probably designed originally to compute the date of Easter, that were compiled in or soon after 891. Possibly at the instigation of King Alfred the Great this compilation was much copied and widely circulated, and copies subsequently received independent continuations, the latest of which, in the Peterborough version, ends in 1154. Lost versions of the Chronicle were used by Asser in his Latin biography of King Alfred, *De rebus gestis Aelfredi* (ca. 893), and by

Æthelweard in his Latin *Chronicon* (late 10th century). Alfred's zeal for the advancement of learning is also reflected in the OE translations of Bede's *Historia* and of Paulus Orosius's *Historiae adversum paganos*, a universal history to A.D. 417.

Post-Conquest Latin Chronicles

After the Norman Conquest English historians writing in Latin continued to draw on Anglo-Saxon historiographical traditions. For example, taken together, the *De gestis regum Anglorum* and *De gestis pontificum Anglorum* of William of Malmesbury (both first completed ca. 1125) are reminiscent of Bede's *Historia*, while William's unfinished *Historia novella* (before 1143) is similar in its annalistic form to the Anglo-Saxon Chronicle. Similar influences are found in the *Historia Anglorum* of Henry of Huntingdon, a member of the secular clergy, which, in its latest revision (1154/55), covered the period 55 B.C. to 1154.

Monastic chronicles (with which can be considered works by other regular clergy, such as Augustinian canons), were often written by Benedictine historians or reflected their influence; they flourished from the 12th to the mid-13th century, then declined until they enjoyed a revival in the later 14th century. Such chronicles vary in historical scope, though most show a particular interest in local affairs pertaining to the history and position of the religious house in which they were produced. Notable works include John of Worcester's *Chronicon ex chronicis* (from Creation to 1140); Richard of Hexham's *De gestis Stephani et de bello standardii* (1135–39); the *Gesta regum* attributed to Symeon of Durham (early 7th century to 1129) and John of Hexham's continuation thereof (1130–54); Gervase of Canterbury's *Chronica* (time of Augustine of Canterbury to 1199) and *Gesta regum* (from the legendary Brutus to 1210); Richard of Devizes's *Cronicon de tempore regis Richardi primi* (1189–92); William of Newburgh's *Historia rerum anglicarum* (1066–1198); and Ralph of Coggeshall's *Chronicon anglicanum* (1066–1224). A number of chronicles dealing in part with English history were also written and circulated in Normandy, such as Orderic Vitalis's *Historia ecclesiastica* (A.D. 1–1141) and Robert of Torigni's *Chronica* (Creation to 1186).

In the 13th century the Abbey of St. Albans became a major center of historical writing. In addition to a history of the abbey and a series of saints' lives Matthew Paris built on the work of Roger of Wendover to produce his heavily illustrated *Chronica majora* (Creation to 1259) and the derivative *Historia Anglorum*, the *Abbreviatio chronicorum*, and the *Flores historiarum*.

The *Flores* later received continuations at St. Albans and elsewhere and was an influential work on subsequent histories.

Similarly influential in the 14th and 15th centuries was Ranulf Higden's *Polychronicon*, a universal history from the Creation to, in its final version by Higden, 1352. Higden's work received numerous continuations in various monastic houses and was used by such later chroniclers as John of Tynemouth, John of Brompton, and Henry Knighton and in the *Eulogium historiarum*. A *Polychronicon* continuation was also used by Thomas Walsingham, whose major historical works, the *Chronica maiora* (a continuation of Matthew Paris) and *Ypodigma Neustriæ*, represent a revival of the St. Albans tradition of historical writing in the late 14th and early 15th centuries. The monastic tradition, however, declined once more by the mid-15th century, due in part to the increasing popularity of vernacular histories.

Anglo-Norman Chronicles

From the mid-12th century there also developed a tradition of Anglo-Norman historical writing that, unlike the monastic chronicles, was heavily influenced in style or tone by romance literature and was at first primarily composed by members of the secular clergy. In the case of full-scale chronicles the major source for English history between Brutus and Cadwalader was Geoffrey of Monmouth's immensely popular *Historia regum Britanniae*, completed probably in 1138, which also influenced Henry of Huntingdon. Shortly before 1140 Geoffrey's *Historia* was adapted by Geffrei Gaimar to form the now-lost beginning of his verse chronicle *L'estoire des Engleis*, and it was also the source for Wace's *Roman de Brut* (ca. 1155), which supplanted the first section of Gaimar in the manuscripts. The first part of Peter of Langtoft's verse *Chronicle* is a paraphrase of Geoffrey.

Through Wace Geoffrey's *Historia* forms the basis for the early history in the Anglo-Norman prose *Brut* (first written in the reign of Edward I, though it received several continuations in the 14th century), and it was also used as a source in other prose chronicles, such as Nicholas Trevet's *Cronicles* (Creation to early 1330s) and Sir Thomas Grays *Scalacronica* (Brutus to 1363). The prose *Anonimale Chronicle* (Brutus to 1381) is similar in its earlier contents to the *Brut*, which in fact is used to supply a continuation from 1307 to 1333. Romance influence and chivalric values are also present in the late-12th-century verse *Chronique de la guerre entre les Anglois et les Ecossois* by Jordan Fantosme and Ambroise's verse *Estoire de la guerre sainte*, in the early-13th-century verse *Histoire de Guillaume le Maréchal*, the late-14th-century prose

Vie du Prince Noir by the Chandos Herald, and in the mid-14th and early-15th-century recensions of Jean Froissart's prose *Chroniques*. In Scotland such influences are also found in John Barbour's *Bruce* and Harry's *Wallace*, both written in Middle Scots.

Middle English Chronicles

The continuations made up to the mid-12th century to the Peterborough version of the Anglo-Saxon Chronicle represent the conclusion of the vigorous OE tradition of prose chronicle writing. Later a new verse tradition of ME historical writing arose, originally modeled on French verse chronicles like those of Gaimar and Wace, resulting in the comprehensive treatments of English history found in La3amon's *Brut* (written ca. 1200); the A and B versions of Robert of Gloucester's *Chronicle*, the anonymous *Short Metrical Chronicle*, Robert Manning's *Chronicle* (all written ca. 1300–40); Thomas Castle-ford's *Chronicle* (mid-14th century); and the A and B versions of John Hardyng's *Chronicle* (mid- 15th century). In Scotland Andrew Wyntoun's *Original Chronicle*, completed ca. 1420, presents a similarly full, versified account of Scottish history and its biblical and classical antecedents.

The popularity of verse chronicles, however, was small compared with that enjoyed by ME prose chronicles after their réintroduction in the late 14th century. As in the case of the verse chronicles the earliest prose chronicles were originally translations, but as linguistic confidence and nationalist pride increased many developed into independent English productions early in the 15th century. Major prose chronicles in modern editions include John Trevisa's translation of the *Polychronicon*; the first translation of the prose *Brut*, the most popular and successful of all ME secular works and one that received many continuations and adaptations in the 15th century; the various versions of the *Chronicles of London* (designed for a growing civic, lay audience); and John Capgrave's *Abbreviation of Chronicles*. Major unpublished chronicles include translations of Geoffrey of Monmouth's *Histoña regum Britanniae*, of Nicholas Trevet's Anglo-Norman *Cronicles With* a continuation beginning in 1327 and breaking off in 1417 from the English prose *Brut*, and of Martin of Troppau's *Chronicon pontificum et imperatorum*, and prose paraphrases of Robert of Gloucester's *Chronicle* and Robert Manning's *Chronicle*.

Shorter ME prose chronicles focusing on specific events or periods include the *English Conquest of Ireland* (probably translated from a Latin chronicle ultimately based on the *Expugnatio hibernica* of Gerald of Wales); John Shirley's *Death of the King of Scots* (said to be translated from Latin); and the

chronicle of the years 1461–74 erroneously attributed to John Warkworth, which is appended to two manuscripts of the *Brut*.

Ecclesiastical history can be represented by two ill-matched ME works. The *Book of the Foundation of St. Bartholomew's Church in London* piously relates the history of the church, with associated miracles, while a Lollard chronicle of the papacy presents a vitriolic account of the "rablement of the popes" drawn from Higdens *Polychronicon*, supplemented by Martin of Troppaus *Chronicon*.

Unlike the ideal of modern historical writings none of the above works is written from a totally detached viewpoint; the medieval chronicler does not hesitate to use history to state or draw moral judgments or to show political predilections. Even more consciously designed to influence are those short relations of recent or current events circulated as open newsletters or as propaganda pamphlets, particularly during the politically turbulent late 15th century. Official or semiofficial accounts, such as the *Chronicle of the Rebellion in Lincolnshire* (1470) and the short and long versions of the *History of the Arrival of King Edward IV* (ca. 1471), use privileged inside information and official documents. Genealogical chronicles of Edward IV, beginning with Adam, justified the legitimacy of his claim to the throne.

Some relatively short ME poems parallel in subject matter and intended audience the shorter prose texts noted above. They are common from the beginning of the 14th century, which was the heyday of the full-scale verse chronicle, until the end of the 15th century and beyond, and all are marked by some form of nationalist pride or partisanship. Most similar in general outline to the ME prose chronicles, and quite possibly derived from a *Brut* chronicle, are Lydgate's highly popular verses on the *Kings of England*. The anonymous *Battle of Halidon Hill* and John Page's *Siege of Rouen* are verse narratives that are close in style to the prose *Brut* chronicle in which they are frequently incorporated. The war poems of Laurence Minot, written over a period of twenty years (ca. 1333–52), have been linked in the surviving manuscript by short prose rubrics in the manner of the chapter headings of a prose chronicle, such as the *Brut*. *The Recovery of the Throne by Edward IV* called "the balet [ballad] off the kynge" at the end of the text, covers much the same ground as the short Yorkist prose *History of the Arrival*.

Copies of Latin and Anglo-Norman chronicles continued to be made in the 15th century, and toward the end of the century the already widespread circulation of ME chronicles was increased by William Caxton's publication of the prose *Brutes* the *Chronicles of England*) and of Trevisa's translation of the *Polychronicon*. Subsequent printers continued to publish these and other historical works, and the medieval chronicles remained major sources for Tudor historians, such as Edward Hall, John Stow, and Raphael Holinshed.

Ciboria: Morgan, Balfour, Warwick

Ciboria are vessels that held the consecrated host for distribution to those celebrating the eucharist. These three copper-gilt, forged, engraved, punched, and *champlevé* enameled ciboria, hereafter referred to as “M” (New York, Pierpont Morgan Library), “B” (London, Victoria and Albert Museum M.I-1981), and “W” (London, Victoria and Albert Museum M. 159–1919; [fig. 40](#)), were all produced ca. 1150–75. M and B are in good condition, while the cover of W and the enamel on the remaining bowl have been lost.

Since the cover of W was presumably comparable with those of M and B, the three ciboria share the same form; a hemispherical bowl standing upon a splayed circular foot, with a cover of similar shape, surmounted by an ovoid handle collared with four cast leaves.

The decorative schemes of the ciboria also compare closely. Inside each lid the Lamb of God in a roundel holds a crossstandard, with blood spilling from his chest into a chalice. Inside each bowl another roundel has Christ blessing, clasping a book and cross. The exterior of each bowl and cover is enameled with six narrative scenes set within roundels surrounded by branches of fleshy foliage blossoms. This arrangement compares well with paintings on the choir vault of the Hospital Chapel of Le Petit-Quevilly, Rouen, of the later 12th century, although the scrolling foliage is similar to that on some contemporary English sculpture and illuminated manuscripts.

[Fig. 40](#). Warwick Ciborium (London, Victoria and Albert Museum M. 159–1919). Reproduced by permission of the Board of Trustees of the Victoria and Albert Museum, London.

New Testament christological scenes on the covers are set above their Old

Testament counterparts on the bowls in a typological arrangement. Thus on B, for example, the Crucifixion is positioned above the Sacrifice of Isaac by Abraham. The varied combination of scenes emphasize different sacrificial and redemptive aspects of the eucharist. Differences in subject matter and iconography are minimal; five scenes are common to all three ciboria.

The linear, schematized figures on M and B compare closely enough to indicate that one artist executed both. The artist of W employs a distinctly more fluid style, leading some to speculate that he was of north French or Mosan (Meuse Valley) origin. Overall similarities of design and choice of subject matter and iconography, however, suggest a single workshop and a commonly available model.

Although elements of the decorative scheme and technical details relate to continental comparisons, the weight of evidence confirms that M, B, and W were produced in England. Of particular relevance are the descriptive inscriptions occupying the frame of each medallion. These are identical with a set of Latin verse inscriptions describing a now destroyed 12th-century cycle of scenes in the chapter house at Worcester. The exact relationship between the two sets of inscriptions remains open to debate, but their proximity confirms an English provenance for M, B, and W and hints at a more intimate connection; the ciboria and chapter house scenes were produced possibly by a single workshop.

Apart from attesting the skill of mid-12th-century goldsmiths, M, B, and W together provide an almost unique opportunity of examining how two artists, trained in very different traditions but working within a single workshop, interpreted commonly available sources.

Cinque Ports

A group of towns on the southeast coast that together supplied the king with the services of 57 ships, fully manned, for fifteen days each year. The original five “head ports” were Hastings, Romney, Hythe, Dover, and Sandwich, but more than 30 other places in Kent and Sussex, and one in Essex, became joined to the different “head ports” at various times. Chief among the affiliated “members” were the towns of Winchelsea and Rye, attached to Hastings before 1190 and later given the status of “head ports.” Each member town received the right to share in the privileges of the Cinque Ports, such as freedom from most external jurisdiction and from customary taxation and tolls, in return for undertaking to discharge part of the burden of ship service.

The Cinque Ports system originated in the reign of Edward the Confessor. After the Norman Conquest ship service was increasingly important as the ports provided the Norman kings with safe transport to their French dominions. With the loss of Normandy in 1204 the Cinque Ports’ fleet became vital for control of the English Channel and protection of the coastline. Although the Cinque Ports continued to perform valuable naval services in the 14th and 15th centuries, other ports overtook them as trading and naval centers, and by the end of the 16th century they were of little maritime significance. Their decline was hastened by violent storms that destroyed Romney harbor and Old Winchelsea in the late 13th century and by the eastward drift of shingle along the Channel coast, which gradually closed the old harbors of Hastings, Hythe, Dover, and Sandwich.

Deputies from each port met in the courts of the “brotherhood” and the “guestling,” where common business for all the port towns was transacted, though each town ran its internal affairs. The ports remained throughout a loose confederation with no central administration, subject to the supervision from the 13th century onward of the royal warden who was also the constable of Dover.

Cistercian Architecture

Founded at Cîteaux in eastern France in 1098 as a reform order of Benedictine monks, the Cistercians first settled in England in 1128. The order spread rapidly, with 46 monasteries by 1154 and an eventual total of 64. For over 400 years the English abbeys played an important role in the spiritual and economic life of the country. Between 1536 and 1539 all were dissolved, and despoiled, on the orders of Henry VIII.

Fig. 42. Fountains Abbey, Yorkshire, nave of church looking east. Courtesy of A.J. Hawkes.

The greatest monasteries were in the north of England. At the four largest—Rievaulx (founded 1131), Fountains (1133; [figs. 41–46](#)), Furness (1147), and Byland (1147)—the communities numbered 300 to 600 at their height around 1225, with estates in excess of 100,000 acres apiece. These holdings, given over mainly to sheep farming centered on granges, were worked by lay brothers, a second category below the monks, who were otherwise part of the monastery. The order's earliest patrons were aristocratic families; only in the 13th century did the kings of England become founders, notably at Beaulieu (1204), Hailes (1246), and Vale Royal (1277). Decline in the numbers and fortunes of the Cistercians in England began in the late 13th century. By the Black Death (ca.

1350) many communities had shrunk to fewer than 30. A modest revival occurred in the 15th and early 16th centuries.

Cistercian architecture has been studied mainly in the northern abbeys, where more survives because sites were isolated and which at the Dissolution became the private properties of the king's allies and thus less open to public pillage. Scholarly study has focused largely on the churches. However, the church was only one of many buildings in a complex comprising from 60 to 90 acres overall within the surrounding wall. Significant remains of nonecclesiastical structures, both domestic and industrial, survive. Far less is known of the orchards, fishponds, and gardens that also lay within the precinct. They are known mainly through documentary accounts.

The order's earliest churches were of wood, serving the community's needs for about the first 25 years. Archaeology has recently revealed such a church at Fountains—a simple rectangular, aisleless building. For stone buildings a clear development in three stylistic phases emerges. From the period 1140–50 the churches at Rievaulx, Fountains, and Kirkstall (all in Yorkshire) are among the best examples of the order's early building. In plan they resemble Cistercian churches in Burgundy, where the movement originated, such as Fontenay (Côte d'Or), and show a square, aisleless eastern termination, transepts with straight east walls, and aisled naves of eight to ten bays. The interior was divided into two parts: that to the east was used by the monks, that to the west by the lay brothers. In elevation the buildings were two-storied—arcade and clerestory—and timber barrel-vaulted, though the aisles had masonry barrel vaults at Rievaulx and Fountains and rib vaults at Kirkstall. Local influence appeared in architectural detailing, but the plan, simplicity of form and surface, utilization of features like barrel vaults, and the avoidance of stained glass, figurative sculpture, and high towers reflected the austerity of the order's French founders.

A second phase begins in the 1170s with the appearance of early Gothic motifs from northeast France. The most ambitious of several buildings from this phase was Byland, Yorkshire. Rivaling cathedrals at 330 feet in length, the plan showed a developed east end that preserved the traditional square-ended form but surrounded it with aisles and a range of eastern chapels. Equally French were the enriched three-story elevation with distinctive arch moldings, octofoil piers, shafts, double-walled clerestories, and an elaborate west wheel window. A timber barrel vault closed the space.

Fig. 43. Fountains Abbey, Yorkshire, choir of church, south side. Courtesy of A J. Hawkes.

In the third phase, beginning around 1210, strong English influences dominate the order's architecture. At Fountains the monks' choir (ca. 1208–40) was moved east of the crossing and the building terminated in a sumptuous east transept with tiers of windows, marble shafting, and rib vaults. This provided for nine altars, a design later copied at Durham Cathedral (from 1242). At Rievaulx, Jervaulx, Netley, and Tintern the east end was given a seven-bay rectangular form, while at Croxden, Hailes, and Vale Royal the east end was characterized by an ambulatory with radiating chapels that suggests the influence of royal Westminster Abbey. Tracery appears at Netley and Tintern around 1260, again from London sources. In the assimilation of high Gothic trends from other monastic, canonic, or cathedral sources in England this phase of Cistercian architecture is interpreted as indicating a loosening of the order's sense of identity.

Fig. 44. Fountains Abbey, Yorkshire, cloister complex, west side. Courtesy of A.J. Hawkes.

Much survives of buildings other than churches within the monasteries, most notably at Fountains, which is now designated a World Heritage Site. Though less elaborate than the church they are important and have been usefully studied by building type. They show the Cistercians as pioneers in planning and form, particularly in the first century of their settlement in England.

Within the claustral nucleus a number of developments altered the traditional arrangement of monastic buildings. The cloister usually lay to the south of the church, and the buildings on the east side provided the living quarters for the monks: chapter house, parlor, and day room, with dormitory above. Buildings on the west side met the same needs of the lay brothers. Those to the south served as refectory, kitchen, and warming room. The arrangement of both west and south sides reflected the distinctive makeup of Cistercian communities.

Outside the cloister, usually to the east of the monks' quarters, lay the abbot's residence and accommodations for distinguished visitors, and beyond these the monks' infirmary. For the latter archaeology has revealed a superb example at Fountains with its own chapel, kitchen, and two-story residence block. Dating from the 1230s, the building measured 180 feet by 78 and was fully vaulted, with a tall central space, reserved probably for great wardrobes for blankets and clothing, and lower aisles where the beds were placed against the outer walls. At other houses infirmary buildings were smaller but still impressive and speak to new standards of care of the infirm and ill. To the east of these buildings again but still within the precinct wall lay the abbey's orchards, gardens, and fishponds.

Fig. 46. Fountains Abbey, Yorkshire, entrance to refectory from south side of cloister. Courtesy of A.J. Hawkes.

At the west side of Cistercian abbeys were the entrance and service courts. The great gatehouse sealed the walls (the best early example is Roche from the

1180s) and controlled agricultural and industrial activity. This was grouped around the outer and inner courts and included the mill, stables, houses for oxen and cattle, the smithy, tannery, workshops, and the guest houses for the obligatory hospitality offered to strangers.

While most of the nonecclesiastical buildings date from the years of the orders greatest popularity, they remained in use until the Dissolution, despite the dramatic shrinkage of monastic populations. Some new building types, such as meat kitchens and dining areas, appear after about 1340 to satisfy relaxed dietary regulations. And by 1400 adaptations occurred in the areas occupied by the monks that satisfied needs for greater privacy and relative comfort and in the infirmary to provide a separate residence for the abbot.

Cistercians

An order of monks, first settled in England at Waverley, Surrey, in 1128 by William Giffard, bishop of Winchester, some 30 years after Robert Harding had led the secession from Molesme that resulted in the establishment of the new order at Cîteaux (Burgundy). The order spread rapidly, and by 1152, when their

General Chapter forbade further foundations, there were over 40 abbeys in England alone. Many were concentrated in the north, particularly in Yorkshire. The first Cistercian abbey there was Rievaulx, founded by Walter Espec in 1131. Its first abbot was William, a colleague and former secretary of Bernard of Clairvaux. Within a few years a number of daughter houses were founded from Rievaulx, including two, Melrose and Dundrennan, in Scotland.

Aelred, abbot of Revesby (Lincolnshire), returned to Rievaulx in 1147 to become abbot. He was the outstanding early English Cistercian and one of the great theologians and scholars of his day. Under his leadership Rievaulx expanded to become the largest Cistercian community in England, housing 140 monks by his death. A year after the foundation of Rievaulx another Cistercian abbey was founded at Fountains by reformist monks from the great Benedictine abbey of St. Mary's York. With the support of Archbishop Thurstan of York, a prominent patron of the new monasticism, and of many leading regional families Fountains soon became the wealthiest and most prestigious of the English foundations, a position it retained until the Dissolution in the 1530s, when it was the only Cistercian abbey to have an annual assessed income of more than £1,000. Like Rievaulx it was responsible for the creation of a number of daughter houses and even established a Cistercian abbey in Norway.

The Cistercian expansion was reinforced by the order's takeover in 1147 of the abbeys of the Norman congregation of Savigny. This brought some thirteen abbeys in England and Wales under Cistercian control, though the Savigniac abbeys, led by Furness, resisted the amalgamation. The first and most productive generation of growth led to new Cistercian abbeys, not only in England but also in the Celtic lands. Some, like those in Scotland, were established from English abbeys; in Wales and Ireland there were independent foundations. In the second half of the 12th century a number of abbeys were founded in Wales through the patronage of native princes, while in Ireland the White Monks (as Cistercians were called, because of their white habits or robes) retained nationalist sympathies and had few links with their English counterparts.

There were also nunneries that followed Cistercian customs. Their precise status, particularly in the 12th century, has been questioned; the early Cistercians' attitude toward women in the religious life was at best ambivalent, at worst hostile. By the end of the 13th century, however, there were probably nearly 30 communities for women observing a version of the Cistercian rule. The influence of the English Cistercians was also felt outside their order. Cistercian practices heavily influenced the development of the order of Sempringham (or Gilbertines), and the order enjoyed close ties with other reformed monasteries and with individual hermits.

From the earliest years the Cistercian economy was founded on pastoral farming, particularly the production of wool, and though the prohibitions of their rule on the possession of manorial and spiritual revenues were soon largely ignored, the Cistercians seldom gained more than a small proportion of their income from their role as absentee landlords. Similarly, though a few late Cistercian abbeys were established in towns, such as Oxford and London, urban property was little developed, and the majority of foundations were concentrated in isolated areas.

The degree to which they “created a desert” by forcibly removing communities from their neighborhoods, as alleged by hostile critics like Walter Map or Gerald of Wales, has been debated. It is likely that Cistercians established abbeys or granges in sparsely populated areas. Granges were organized as self-contained agricultural units, supervised by lay brothers (*conversi*), though their role was increasingly taken over by peasant laborers in the later Middle Ages.

By the end of the 13th century many of the abbeys, including Fountains and Rievaulx, were in severe economic difficulties, often as a result of poor wool yields and ill-considered financial dealings with Italian merchants. Some had to be temporarily disbanded or taken into royal hands, and recovery was frequently impeded by Scottish raids in the early 14th century.

Thereafter the Cistercians suffered, as did most English monasteries, from changing economic and demographic conditions. Most gave up working the land directly and rented out their estates. Thus their way of life became scarcely distinguishable from that of the old Benedictine houses, with increasingly lavish buildings and churches and separate quarters for the abbots. By the Dissolution the numbers of Cistercian monks had fallen dramatically, and, though some abbeys resisted Henry VIII’s ecclesiastical policies, by the end of 1539 all the Cistercian communities had disappeared.

Clanvowe, John (ca. 1341–1391)

Author of *The Two Ways* and probably *The Book of Cupid*. In the 1360s and 1370s he fought in various campaigns in France led by John of Gaunt. In 1373 he entered the service of Edward III and after that king’s death he continued in the household of Richard II.

In *The Two Ways* Clanvowe urges his readers to follow the narrow path to salvation by avoiding the broad way of worldliness that, on occasion, he equates with the sort of courtly lifestyle he must himself have led (lines 484–503). The chroniclers Knighton and Walsingham mention Clanvowe among the knights of Richard Us court whom they accuse of Wycliffite sympathies, and it is interesting at one point that Clanvowe applies the word “lolleris” to himself and others who believe as he does (512).

The Book of Cupid, sometimes called “The Cuckoo and the Nightingale,” is a courtly St. Valentine’s Day dream vision. A first-person narrator, who describes himself as “olde and unlusty” (37), overhears a debate about love between an idealistic nightingale and a cynical cuckoo. It opens by quoting the *Knight’s Tale* (1785–86) and makes considerable use of devices and conventions found in several early poems by Chaucer, whom Clanvowe knew.

Clare Family

The history of the Clares provides an outstanding example of how rich and powerful a dynasty could become through royal favor and strategically planned marriage alliances.

As a reward for his service in 1066 the Norman Richard Fitz Gilbert received 176 lordships from William the Conqueror. Many of these belonged to the honor of Clare, the Suffolk administrative center of a complex of landed estates, whence the family took its English name. The earldom of Hertford was acquired in 1138, but the most important move came with the marriage of Richard de Clare (d. 1217) to the earl of Gloucester’s sole heiress. This brought the Clares a second earldom, extended their influence far into Wales and Ireland, and made them the greatest baronial landowners of their day.

They were thus equipped to play a leading role in the military and political life of the country; as the career of Gilbert, “the Red Earl” (d. 1295), shows, they were even able to defy the crown with impunity. His help made possible the defeat of Simon de Montfort in 1265; his retinue was strong enough for him to march into London against the wishes of a frightened Henry III; his demands for the restoration of those who had been disinherited in the Barons’ Wars had to be met by the reluctant monarch. With a gross annual income in excess of £6,000 (about a third from Welsh lands) and huge manpower resources, he was indeed a suitable husband for Edward I’s daughter Joan of Acre.

The next earl died childless at Bannockburn (1314) and brought these heady dynastic ambitions to an abrupt end. The division of his vast estates among his three sisters (one of whom founded Clare Hall, Cambridge University) effectively marked the end of the Clares as a political force, although other ambitious families, such as the Beauchamps, followed similar paths to fame and fortune.

Cloisters Cross

The double-sided processional or altar cross in the Cloisters Collection of the Metropolitan Museum of Art in New York ([fig. 47](#); h. 577mm, w. 362mm) is generally considered a remarkably well preserved masterpiece of English Romanesque ivory carving. Its original location and its mid-12th-century date are a matter of continuing debate, since precise documents are lacking. A proposed attribution to Bury St. Edmunds is still the one most thoroughly discussed, based principally on what is known of the intellectual and liturgical context of the abbey and its library holdings, as well as the relationship of the carving to the earlier style of Master Hugo's Bury Bible.

Fig. 47. Cloisters Cross, front (New York, The Metropolitan Museum of Art, The Cloisters Collection, [12, 63]). Courtesy of the Metropolitan Museum of Art.

Nearly 100 figures and over 60 inscriptions cover the surfaces of this walrus-ivory cross, the front of which, by its lopped branches, is characterized as the

Tree of Life. Old Testament prophets, for the most part, line the shaft and crossbar on the back, each figure identified and holding a scroll inscribed with a scriptural text. The central roundel on the front of the cross depicts Moses and the Brazen Serpent, surrounded by witnesses and other figures bearing Old and New Testament inscriptions. Just above it is the rare representation of the dispute of Pilate and the high priest over the wording of the titulus, or notice, placed on the cross (John 19:21–22). They stand on the titulus itself, which in Greek and Latin (and an indecipherable Hebrew) carries the unusual wording: “Jesus of Nazareth, King of the Confessors.” Scenes of the Passion and Resurrection on the right and left terminal plaques of the cross-bar and the Ascension above are visually juxtaposed with the evangelist symbols: Luke’s ox on the right, Mark’s lion on the left hand terminal, and John’s eagle in the top. They surround the central roundel with the Lamb, shown turning from the downcast figure of Synagogue, while an angel consoles the weeping John with a triumphant Easter message. Matthews winged man is the subject of the missing base terminal, and presumably the Nativity was depicted on the front, just below where Adam and Eve cling to the base of the cross. Triple streams of blood on Adam’s shoulder connect him to the now missing corpus once affixed to the cross; two sets of holes allowed for separate points of attachment at different periods.

Although the main elements of the format are part of a venerable, ongoing tradition, the scheme as a whole and the individual scenes vary considerably from standard models. A comparable originality informs the humanism of the tiny figures inhabiting the monumental framework of this Romanesque cross. The basic key to the complex program lies less in a direct castigation of the Jews, as has sometimes been argued, than in the function of the cross within the dramatic liturgy of Holy Week—principally Good Friday and Holy Saturday—and Easter. These associations, enriched by a choice of scriptural texts that reflects the systematic mind of a pious *litteratus* familiar with the nuances of contemporary biblical scholarship as practiced by the students of the influential Hugh of St. Victor in Paris, have only begun to be explored.

Cloth Manufacture and Trade

By the end of the Middle Ages woolen cloth manufacturing had become England's leading industry, employing more labor than any other craft, consuming a large share of agricultural output in wool, and providing the country's main export. Previously England had been far more renowned as an exporter of raw wools, especially the fine, short-fibered wools from the Welsh marches, the Cotswolds, and Lincolnshire, Europe's best and an absolute requisite for high-grade luxury woolens. At the beginning of the 14th century England was exporting an average of 35,350 woolsacks (364 pounds each) a year, from about 7.5 million sheep, enough for 160,000 standard broadcloths (measuring 24 yards by 1.75 yards). Cloth exports were then unimportant, greatly exceeded by woolen imports from the Low Countries. By the late 15th century, after a remarkable industrial transformation, England had become the leading producer of woolens in Europe, exporting an average of 51,850 broadcloths a year in the 1480s, but only 8,511 woolsacks (to make 38,300 broadcloths). Low Country merchants, who had now lost their primacy in quality textiles, compared the flood of English imports in those years to an inundation from the sea.

Many theories, none wholly satisfactory, have been advanced to explain this industrial and commercial transformation. Since the two most famous concern the technology and organization of the woolen industry, their evaluation must begin with a discussion of the manufacturing processes.

Production was generally organized by a putting-out system. Wool merchants or brokers sold raw wools to merchant-drapers or clothiers, who "put them out" to artisans to be worked into cloth. First in the chain came those who prepared the wools, cleansing them with repeated beating and washing and sorting them by staple length. The shorter, curly-fibered wools were then thoroughly greased with butter to facilitate subsequent processes, and some might be dyed blue in woad to provide the foundation for various colors in dyeing the finished cloth.

The wools so treated, dyed or undyed, were then sold to weaver-drapers, who organized the manufacturing processes. They in turn put out these wools to combers and carders, who made them suitable for spinning. Combing was the older technique for preparing all wools, while carding with wire brushes was introduced in the 12th century as a more efficient technique for

disentangling and preparing short-fibered wools. The combed and carded wools were next put out to spinners to be converted into both warp and weft yarns. The weaver then claimed the yarns, paying the spinners, combers, and carders piecework wages.

As the foundation yarns for weaving, the warps (30 yards long) were wound on a roller-beam at the loom's rear and then stretched tautly onto another roller-beam at the front. The weft yarn, carried by a shuttle along grooves in the laysword, was inserted between alternating groups of warps pulled apart by heddles (loops) on pulley strings attached to foot-powered treadles. After each insertion it was beaten up into the fell of the cloth by the batten or wooden front of the laysword. Finally the weaver operated a lever to roll up the cloth and to feed out more warps from the rear beam.

This treadle-operated horizontal loom was the most important innovation in all clothmaking. From the 11th or 12th century it gradually displaced the upright "warp weighted" loom, which had produced narrow, short cloths, evidently worsted fabrics, composed of coarser, straighter-fibered yarns, with a highly visible weave, usually in a lozenge design. The diffusion of the new horizontal loom, and especially its evolution into the broadloom requiring two weavers, seems to be associated with a real revolution in textiles—the rise and ultimate supremacy of the broadcloth. A wider, longer, heavier, and generally costlier cloth, composed of fine, curly, densely packed wools, it was thoroughly felted and shorn to obliterate any trace of weave and so provide a texture comparable to some silks.

Spinning had also undergone a technological innovation, though more limited in significance, with the spinning wheel, associated with carding from the 13th century. It supplemented but did not displace the ancient method of spinning combed wool fibers by dropping a weighted, rapidly revolving spindle. The spinning wheel converted this single spindle into a horizontal axle driven by a belt attached to a hand-powered wheel, which vastly increased productivity at the expense of a yarn uneven in both strength and quality.

Thus warp yarns, necessarily tighter and stronger to withstand stress on the loom, continued to be spun from combed wools with drop spindles, while the weaker wefts came to be spun from carded wools with the new wheel. However, if traditional literature can be believed, the later medieval English industry may have been an exception in producing both yarns, warp as well as weft, from wheel-spun carded wools.

Whereas worsteds, with strong, coarse yarns, were fully manufactured when woven on the new looms, true woolens required the subsequent process of fulling. There were three objectives: to scour and cleanse the cloth; to force the weak, short, scaly fibers to interlock in a felted, strong, durable fabric; to shrink it (up to 60 percent in area), thus increasing its weight per square foot.

By the traditional method a master fuller and two journeymen immersed the woven cloth in a large vat of water with soap and fuller's earth (kaolinite or hydrous aluminum silicate) and then trod upon it for three days or more. Finally the cloth was hung on a tentering frame to dry, stretched to remove wrinkles.

At this point the weaver-drapers would usually sell the cloth to merchant-clothiers, for resale or export in raw form. Or they could commission shearers and dyers to finish it: by repeated raisings or napping, with teasels, to bring up all loose fibers; by several shearings with long razor-sharp blades; and by dyeing in-the-piece, usually with a combination of woad and madder.

The crucial fulling process, which completed the manufacturing and initiated the finishing processes, had also undergone a major technological innovation: "milling," with heavy water-powered wooden trip hammers that replaced human feet. Introduced into Normandy by 1086 and England from the 12th century, water-driven fulling mills were the first and only important mechanization of cloth production before the modern Industrial Revolution. For Carus-Wilson it was a 13th-century "industrial revolution" that explained how the young industry vanquished its Flemish rivals to capture Europe's cloth markets, for "Flanders is a land of windmills rather than watermills." Fulling mills were also instrumental, in her view, in attracting the cloth industry from the lowland towns of eastern England to more advantageous rural locations in such hilly regions as the West Riding (Yorkshire), the Cotswolds, the Mendips, and Wiltshire. Such rural locations provided swiftly flowing rivers needed for fulling mills and the "freedom from the restrictions of urban guilds and high taxation."

Any thesis positing a premodern "industrial revolution" is bound to invite a reaction, and Carus-Wilson's views have fallen into disfavor. The first attack argued that the traditional urban cloth industry, unable to compete with Flemish imports in the later 13th century, had sought refuge in the countryside, not to seek out fulling mills but to reduce labor costs, chiefly by utilizing much cheaper part-time agricultural labor. In these respects rural clothmaking supposedly gained a major cost advantage over urban draperies, at home and abroad.

A more serious threat to Carus-Wilson's thesis was the discovery that water mills were used in the Low Countries during the Middle Ages; subsequently, in the 16th century, water-powered fulling mills rapidly spread into textile districts of southern Flanders and Brabant. In England water mills were even more abundant in the eastern, lowland regions, including some traditional clothmaking towns. A.R. Bridbury argues, however, that they were used for mechanical fulling only rarely, under manorial compulsion, when lords had no better use for them. He also found no important advantages for rural industry

and contends that urban draperies continued to account for the larger share of late-medieval *commercial* cloth production.

In toto these arguments deny that mechanical fulling provided any decisive cost savings, though no statistics are offered. For the Low Countries and Italy, however, recent calculations indicate that fulling mills provided at least a threefold productivity gain. While traditional foot fulling accounted for about 20 percent of prefinishing production costs (at Leuven and Leiden), mechanical fulling at Florence was responsible for only 5 percent of such costs.

Rural locations, furthermore, did provide some important advantages for the English industry. First, rural fulling mills on fast-flowing upland country streams could use the relatively cheap, space-saving undershot wheel, instead of the capital-costly (though efficient) overshot wheel, with capacious millponds and millraces, required for most urban mills located downstream on slow-moving rivers. Second, clothiers could utilize the putting-out system to pass most capital costs, much lower than those in urban industry (even with a similar organization), on to the artisans, primarily agricultural workers who owned their implements and worked in their homes with family labor (the “domestic system”). Money wages were undoubtedly also far lower in rural areas; whether real labor costs, measured in productivity, were really lower is a moot question. Urban locations, on the other hand, offered the advantages of better supervision, discipline, and more skilled labor, particularly for higher-grade woolens. Thus combing, carding, and spinning were predominantly rural, while, for better-quality woolens, much of the subsequent weaving and finishing still took place in towns.

Subsequently, however, long after the establishment of this quasi-rural industrial structure, the English cloth industry gained a far more decisive advantage from the crown’s late-medieval fiscal policies. From the outset of the Hundred Years War (1337–1453) the crown sharply increased the modest duties on wool exports (6s. 8d. per sack, plus variable subsidies) to often exorbitant levels, varying from 40s. to 50s. or more per sack. By the later 14th century the tax burden had risen to about 45 percent of the average wholesale wool price. Within England, however, domestic clothiers could purchase these same fine wools tax-free, while their cloth exports, first taxed in the hands of English merchants in 1347, bore a far lower rate, indeed a minimal duty of 1s. 2d., about 2 or 3 percent of current cloth-export values. Since English wools in the finer broadcloths woven in the Low Countries accounted for 60 to 70 percent of their prefinishing manufacturing costs, one can appreciate the large (if unintended) advantage that English clothiers gained from this differential in export duties.

Although English cloth exports subsequently rose strongly and wool exports fell correspondingly, the tax differential did not immediately provide the

industry with that decided an advantage. First, only from the 1360s, with the formation of the Calais Staple Company as a quasi-monopolistic organization of wool sellers, was the tax incidence passed on to foreign buyers (rather than to the wool growers in lower prices). Second, wool export duties were specific, not *ad valorem*; they became truly oppressive for foreign buyers only with general deflation and the fall in wool prices during the late 14th and early 15th centuries. Major foreign buyers, in the Low Countries and Florence, responded by concentrating production in the upper luxury range, using only the finest, most expensive English wools, for which these specific duties constituted a far smaller proportion of costs.

Nevertheless, the structure of European cloth markets in the early 15th century may seem puzzling. Low Country draperies had not yet sought out alternative wools for cheaper cloths but were still thriving with luxury woolens. Indeed the concentration on luxury production with English wools explains their refusal to employ mechanical fulling—for fear of impairing quality. In Germany and central Europe Flemish woolens had regained preeminence, while the less expensive English cloths ranked a distant fourth (after Brabantine and Dutch cloths). In the Mediterranean, where costly Italian woolens were preeminent, English woolens fared even worse, despite lower prices.

A possible solution to this paradox may be found in the severe afflictions that beset the late-medieval economy, in depopulations from recurrent plagues and famines, and especially in widespread warfare, spawning periodic civil strife and social anarchy. In international trade all these adversities sharply raised marketing and transaction costs to preclude or discourage commerce in cheap textiles. They may also have produced a more highly skewed income distribution that similarly favored trade in luxury over cheaper textiles. Significantly the expansion of England's broadcloth exports mirrored the rapid fall in exports of far cheaper worsteds. Certainly English broadcloths were luxuries, when measured by the purchasing power of wages for urban craftsmen. In the late 14th century a standard broadcloth would have cost a London master mason (England's best-paid artisan at 7.5*d* daily) about three months' pay. Nevertheless, in both price and quality English broadcloths ranked in the lower range of luxury fabrics. It was for such a market that England's cloth exports expanded most successfully, from the 1460s.

Some reasons for that expansion lie in the rise in real incomes of Europe's middle social strata; in the reduction of the aforementioned economic afflictions by the mid-15th century; and in a general demographic and commercial expansion that helped reduce transaction costs in international trade. One powerful force for commercial expansion in this era was the central European silver-mining boom, ca. 1460–1530. South German merchants

directed this new silver to markets offering the best price, chiefly the new Antwerp Fairs. There they acquired English woolens, now dyed and finished in the region, as their principal return cargo for Germany and central and eastern Europe.

At this crucial turning point another misguided adventure in English fiscal policy rendered a final, gratuitous service to the expanding English cloth trade. In 1429–30 the crown imposed the Bullion and Partition Ordinances on the Calais Staple, which had a virtual monopoly on wool exported from England to the Continent, to extort ready cash for the military garrison at Calais. In return for full control over wool sales a small clique of Staplers was required to raise wool prices and extract full payment in English coin and bullion (minted at Calais) while denying purchasers any credit. By the late 1460s, just before the crown was forced to suspend these hated ordinances, the Flemish luxury draperies had suffered a mortal blow, as indicated by the plunge in their production indices and in English wool sales (from an annual mean of 14,230 sacks in the 1420s to a mean of just 7,275 sacks in the 1460s).

Elsewhere in the Low Countries, however, the quasi-rural *nouvelles draperies* proved to be more resilient; their fortunes rose with the decay of the ultra-luxury urban draperies. Producing lesser-quality woolens, though often imitating the big urban draperies, they had been less dependent on English wools, often mixing them with others. Thus they were more receptive to a relatively new substitute: Spanish *merino* wools, whose quality had steadily improved to rival medium-grade English wools.

The final victory of the English cloth trade must be understood in the context of industrial and commercial changes abroad, especially in the Low Countries. From the late 14th century the urban draperies in Flanders and Brabant had also suffered from ruinous conflicts with the Hanseatic League, conflicts that opened up new markets for English cloths in the Baltic. By the mid-15th century, however, the Hanse and the Danes had managed to exclude English shipping from this region. The real commercial beneficiaries of expanding English cloth exports turned out to be the Dutch, who took advantage of both Anglo-Hanseatic and Flemish-Hanseatic strife to expand their own Baltic shipping, gaining dominance there by the early 16th century. That, furthermore, was a major reason why Holland's own woolen industry at Leiden survived this rapidly growing onslaught of the English cloth trade until the mid-16th century.

Cloud of Unknowing, The

A treatise on prayer in the tradition of apophatic mysticism (which seeks God by going beyond images, concepts, and created attributes). The canon of its anonymous English author also includes six cognate tracts. Of these tracts *The Cloud* and *The Book of Priue Counselling* are treatises on contemplative prayer (called “the work”) and are similar in content, structure, and style. *A Pistle of Preier* also deals with contemplation, drawing principally on the authority of St. Bernard. *A Pistle of Discrecioun of Stirings* is written for a disciple less advanced than the disciple addressed in *The Cloud*. The other three tracts are translations from Latin sources: *Deonise Hid Diuinite*, a translation of the *Mystical Theology* of Pseudo-Dionysius; *A Tretyse of the Stodye of Wysdome That Men Clepen Beniamyn*, an abridged paraphrase of Richard of St. Victor’s *Benjamin minor*; and *A Tretis of Discrescyon of Spirites*, parts of which closely paraphrase selections from St. Bernard’s *Sermones de diversis* 23 and 24.

These writings originated in the last quarter of the 14th century in the central area of the northeast Midlands. James Greenhalgh (d. 1529/30), a Carthusian, believed that Walter Hilton wrote *The Cloud*. Hodgson, along with most other scholars, discounts this theory, holding that Hilton and the *Cloud*-author were both men of learning and masters of the vernacular and knew each other’s works. Clark theorizes that *The Cloud* is in part a response to Hilton’s *Scale of Perfection*, book I, and that the language and theology of *The Cloud* in turn influenced book II of Hilton’s treatise. Internal evidence suggests that the *Cloud*-author was a priest, probably a Carthusian, dedicated to the contemplative life, learned in patristic and monastic literature, and acquainted to some extent with the teaching of Thomas Aquinas.

At least seventeen manuscripts containing *The Cloud* and/or one or more of its related treatises are extant, including two Latin versions of *The Cloud*. Hodgson observes that the history of transmission cannot be recovered, because of the large number of random agreements and contamination caused by lateral conflation. The oldest transcription dates from the 15th century (BL Harley 674). The best known of the Latin versions is Cambridge Pembroke 221, completed in 1491 by Richard Firth of Methley, a Carthusian, and annotated by two other Carthusians.

The metaphor of “the cloud” goes back at least to the *Stromatum* of Gregory of Nyssa (ca. 335–395). While no immediate source for *The Cloud* is known, the author draws on a common tradition of contemplative spirituality. From Neoplatonism, as channeled principally through Augustine and Pseudo-Dionysius, the author derives his doctrine of dark, negative mysticism. There is a likeness, too, to the Rhineland mystics, who were generally in the same

apophatic tradition and endeavored to abandon the self in the dark mystery of God in order to forget their own being. Immediate influences on the *Cloud-author* include Thomas Gallus and Hugh of Balma's *Viae Sion lugent*.

For some in the apophatic tradition divine union is a form of supraconceptual knowing and for others, a way of knowing through love; but for the *Cloud-author*, at the highest stages of ascent, mystical union takes place through love alone. *The Clouds* doctrine is solidly Christian and trinitarian: as Christ, the Word of God, is of the same nature as the Father but distinct from him in personality, so the mystic becomes, by grace, one nature with God while remaining distinct from the Uncreated Being in person. Nor is the work anti-intellectual or anti-institutional: the spiritual guide assumes that his disciple has previously followed the common prayer of the church and has meditated on the humanity of Christ as set forth in the Gospels. But at this stage of prayer discursive thought has lost its function and should be transcended.

The Cloudis in the form of a letter from a spiritual guide to a young man, though it is also intended for a larger audience. Its excellent prose style is marked by balance, restrained rhythms, functional alliteration, epigram, precision, and variety. The imagery is both earthy and evocative and often conjoined with faintly humorous irony. Reflecting his Dionysian sources, the author relies on paradox to suggest ineffable mysteries.

The goal of the treatise is to teach a simple prayer of longing that will pierce the "cloud of unknowing"—the privation of knowing that signifies that God can be loved but not thought or conceptualized (though the author still speaks of God in the male gender). Having entered through the door, which is Christ, and moved by special grace, the disciple must place all thoughts, images, and even the awareness of his individual being, under the "cloud of forgetting." Then by a "stirring"—an impulse of love—the disciple seeks God in the innermost spiritual center of the soul and cleaves with the will to God alone in transcendent love. This "work" is formalized in the concentrated repeating of a single word or phrase until it becomes habitual. Though the believer cannot attain identity of substance with the Uncreated, the perfect soul becomes by grace what God is by nature. They become one in loving but remain diverse in substance.

Modern readers have been quick to note that "the work" appears similar to exercises in non-Christian mysticism, especially Zen Buddhism. But in spite of similarities in language *The Clouds* Christian mysticism can be clearly distinguished from Zen (Johnston). Loss of self in *The Cloud* signifies that the ego-self is replaced by the true self in Christ, leading to the experience of something within loving something else. In Zen positive love is generally less conspicuous, and the practice of Zen aims at forgetting everything so that only

self remains. *The Cloud*, in contrast, leads to forgetting all so that only God remains.

Cnut (d. 1035; r. 1016–35)

Danish and English king, best known in English legend as the king whose command to the waves to stop was ignored by the incoming tide. The story, first recounted by Henry of Huntingdon in his *Historia Anglorum*, shows Cnut's posthumous fame as a man of power.

From his youth Cnut certainly understood power and wielded it ruthlessly. On the death of his father, Swein, in 1014 the Scandinavian army tried to make him king of England, but the Anglo-Saxon leadership negotiated instead for Æthelred's return from Normandy. In Denmark Cnut's brother, Harald, had become king, so in August 1015 he again sought the throne of England, joined now by Thorkell the Tall, a former supporter of Æthelred. Cnut gained control of Wessex but failed to capture the southeast. When Æthelred died in 1016, the Londoners recognized his son, Edmund Ironside, as king, while Cnut retained his support in Wessex. After Edmund's defeat at Ashington in Essex he and Cnut agreed to divide the country between them.

The death of Edmund on 30 November 1016 enabled Cnut to become ruler of England. Three strategies ensured his hold on power. In July 1017 Emma, sister of Duke Richard II of Normandy and widow of Æthelred II, became his queen, thereby neutralizing any threat from Normandy, where Æthelred's two sons, Edward and Alfred, were residing. The young sons of Edmund Ironside were moved to Hungary, well beyond Cnut's grasp, unlike Edmund's brother Eadwig, who was murdered by agents of Cnut.

Cnut's second step was to eliminate several of Æthelred's supporters, most notably the duplicitous Eadric Streona; he initially depended on Thorkell the Tall and Edward the Norwegian, whom he recognized as earls of East Anglia and Northumbria, respectively. His third policy was to acknowledge the power of the church by founding monastic houses and becoming, with Emma, a lavish ecclesiastical benefactor. His generosity was doubtless assisted by the mammoth geld payment of £72,000 levied in 1017 on his new kingdom, supplemented by a further £10,500 extracted from London's citizenry.

In the first of four trips he made to Scandinavia between 1019 and 1028 Cnut obtained the throne of Denmark following his brother Harald's death. Our knowledge of his rule in the early 1020s is sketchy. In England Thorkell became an outlaw in 1021 but must have retained a substantial band of supporters, as Cnut was persuaded to accept him as his vicegerent in Denmark in 1023.

In 1027 Cnut attended the coronation of Conrad as Holy Roman Emperor in Rome, presumably in part as a diplomatic move to protect his southern Danish flank against German encroachments. The following year he conquered Norway, driving out Olaf Haraldsson and he made Ælfifu of Northampton

regent there for their young son, Swein. He had contracted a union with Ælfgifu before his marriage with Emma, and he never repudiated the English woman. In the same year Cnut received the submission of three Scottish kings, including Malcolm and (probably) Macbeth of later Shakespearean fame, possibly to ensure that the Norse settlers in northern Britain would not return to Norway to assist in rebellion against his rule there. His Norwegian conquest was nevertheless unsuccessful, and in 1035, just before his death, Ælfgifu and her son had to withdraw to Denmark.

The administrative structures in England were strong enough to continue through his reign, though few of Cnut's charters survive. Two law codes, one of them substantial and revealing the influence of Archbishop Wulfstan, were published in his name, and he issued letters to the English people in 1020 and 1027. In the latter he claims to have negotiated, during his visit to Rome, for the abolition of the tolls exacted from merchants traveling to Italy and the large sums required from archbishops for papal recognition.

In 1017 Cnut had replaced the ealdormen by four earls, though other earldoms were later created. This was to be less significant than the fact that such new men as Earl Godwin displaced the cadre of ealdormen and thegns who had formerly been tied to the Anglo-Saxon kings through a complex network of relationships. Godwin's power base in Wessex, the heartland of the English kingdom, later weakened Edward the Confessor and enabled Godwin's son, Harold, to gain the throne that he held through most of the year 1066.

Cnut did not found a lasting dynasty. After his death in 1035 Harold Harefoot, his son by Ælfgifu, eventually succeeded him in England, and in 1040 his and Emma's son, Harthacnut, became king for two years. Unlike his predecessor Æthelred II, Cnut died in time to leave his reputation intact. He gave England 20 years' respite from invasion, though he left a native dynasty fatally weakened and the country with strengthened ties to Normandy. When he died, the young William the Bastard had just inherited the Norman duchy; as "the Conqueror," William was to accomplish a far more successful *coup d'état* than Cnut and bring the Anglo-Saxon era to a close.

Coffin of St. Cuthbert

Bede tells us in his *Ecclesiastical History* and *Life of St. Cuthbert* that in 698, eleven years after his death, the incorrupt body of Cuthbert, bishop of Lindisfarne, was translated to a wooden reliquary coffin, which was wrapped in linen and placed on top of a stone sarcophagus to the right of the altar in the monastic church at Lindisfarne. This reliquary coffin became the focal point of the saint's cult and continued as such even after the community left Lindisfarne (probably in 875), taking the coffin with them. It was eventually established in the church at Durham (in 995), and after being translated to a new shrine in 1104 it remained undisturbed until the 16th-century Dissolution of the monasteries under Henry VIII. At this stage the shrine was opened and the body discovered, still apparently intact; it was quickly reburied in the

remains of the original wooden coffin and left untouched until a hurried investigation into the tomb was undertaken in 1827.

It was at this stage that the relics of St. Cuthbert (the gold and garnet pectoral cross, portable altar, liturgical comb, the Stonyhurst Gospel Book, textiles and liturgical vestments) were brought to light, along with the fragmentary remains of up to four wooden coffins, set one inside the other. In 1899, during a more leisurely investigation, further fragments of wood were recovered, and it was from a mass of about 6,000 pieces of wood that some 200 were eventually extracted to reconstruct the reliquary coffin originally constructed at Lindisfarne during the elevation of St. Cuthbert in 698. It was composed of six planks of oak, each lightly engraved with a number of images, and a seventh (undecorated) that formed an inner lid. The carved decoration of the coffin (although originally swathed in linen and so not visible to those worshipping at the shrine) provides a rare example of decorated woodwork from early Anglo-Saxon England.

Fig. 48. Coffin of St. Cuthbert, two end panels. Archangels Michael and Gabriel; Virgin and Child. After C.F. Battiscombe (1956). Drawing by C. Karkov.

While what was probably the baseboard of the coffin on which the body was laid is incised with the outline of a stepped-base cross, the other five panels are covered with figural decoration. Christ in Majesty surrounded by the four evangelist symbols is depicted on the lid, with the Virgin and Child on one end panel and the archangels Michael and Gabriel on the other (*fig. 48*). Half-length images of five more archangels decorate one long side of the coffin, and the twelve apostles set in two ranks fill the other side. All the figures are

identified by inscriptions picked out in either runes or the Latin alphabet, an eclectic epigraphic feature found elsewhere in early Northumbria on stone sculpture, coins, and the Franks Casket.

The iconography of the figures decorating the coffin reveals further the eclecticism of early Northumbrian monastic culture. The influence of the Christian Mediterranean world is seen in the figures of Christ and the apostles (which depend on Italian prototypes) and the Virgin and Child (which depend ultimately on the art of the Byzantine East), while the selection of archangels arguably demonstrates the influence of the liturgy of the Celtic church. The full-length evangelist symbols, however, with their books, halos, and wings, betray a fusion of models from the Mediterranean and Celtic worlds, which were brought together in the formation of new, insular, traditions of Christian art.

The Cuthbert Coffin thus provides valuable information about the establishment of a saint's cult in the first century of Anglo-Saxon Christianity and its continued promotion in subsequent centuries. It also demonstrates the diverse and eclectic nature of the cultural milieu of the early Northumbrian church.

Coins, Imagery of

The earliest Anglo-Saxon silver coins, contemporary with the deniers of Merovingian Gaul, are known as *sceattas*, a term meaning “treasure” or “wealth.” Some have Roman coins as their prototypes, some clearly show Frankish influence, and some appear to take their inspiration from Anglo-Saxon art. The larger “penny” that appeared during the second half of the 8th century became virtually the sole denomination of mid- and late Anglo-Saxon coinage. The penny’s broader flan (the blank metal disk from which a coin is made) provided more scope for design, and many of the coins are of high artistic quality. Some indeed rank as minor masterpieces of Anglo-Saxon art, as, for example, some of Offa’s issues, where the royal bust shows definite attempts at portraiture. The Roman and Byzantine influence is apparent but not slavishly copied. Geometric and floral designs, decorated linear inscriptions, and coiled serpents appear as motifs, some derivative and some original. The tail-swallowing serpent on some of Offa’s issues may be traced back to the conventions of Roman iconography, while at a later stage classical influence may be seen clearly on the “two emperors” type of Alfred the Great.

Carolingian influence may also be detected, in the use of a monogram-type mint signature on some reverses, adopted directly from the coins of Charlemagne (d. 814). Examples include pennies struck for Archbishop Wulfred of Canterbury (802–35) and Alfred the Great.

In the 10th century the highest level of artistic achievement was in the reign of Edward the Elder. Portraiture developed considerably from the basic and clumsy realism of Alfred the Great, and many new reverse designs appeared. Some of these, such as the Hand of Providence and floral types, may have been exceptional, but it should be noted that the commoner types were also well executed. Indeed the chief characteristics of numismatic development during Edward’s reign were, in the words of one commentator, “skillful decorative treatment of design and neatness of execution.” The Roman influence continued and is particularly apparent on the “burg” pennies, based directly on the city gate of Constantine’s *Providentia Augusti* coins.

As the coinage developed, it became customary for each coin to carry on the obverse the name of the issuing authority and on the reverse the name of the striking moneyer. The name of the minting town, sometimes in contracted form, also appeared, particularly after the monetary reforms carried out by Edgar in 973. Even through the unsettled times of Æthelred II the standards of design and striking were maintained, and the Normans paid the ultimate compliment to the Anglo-Saxon monetary system by taking it over in its entirety.

Under the Normans periodic type changes and other controls continued but the workmanship gradually deteriorated, reaching its nadir during the anarchy of Stephens reign, 1135–54. The “cross and crosslets” coinage of Henry II was little better and has been described as probably the ugliest of all the medieval coinages. The succeeding “Short Cross” issue spanned the reigns of Henry II, Richard I, John, and Henry III and was followed by the much improved “Long Cross” type in 1248. The cross, extending to the edge of the reverse, was intended as a safeguard against clipping.

A major monetary reform, launched under Edward I in 1279, introduced new denominations and a break with Anglo-Saxon traditions. Halfpennies and farthings were coined, and the fourpence, or groat, made its appearance. The moneyer’s name disappeared, and the design—facing head on the obverse, mint name and cross on the reverse—was to remain basically unchanged until the advent of the Tudors.

The major innovation of the 14th century was the introduction of a stylistically novel gold coinage, under the authority of Edward III and the supervision of Florentine goldsmiths. The series consisted initially of the florin with its half and its quarter but was changed almost immediately to the noble (one third of a pound) with its half and quarter. The obverse design, showing the king standing in a ship, is thought to commemorate the naval victory over the French at Sluys in 1340. With modifications in style it continued to appear on gold coins until the 17th century.

Coins and Coinage

There was a sharp discontinuity in coinage between Roman Britain and Anglo-Saxon England. No coins were minted on the island in the 5th or 6th century, and few appear to have been imported from neighboring continental regions or from Mediterranean mints. The earliest English coins were small gold coins, called *thrymsas*; these 7th-century issues, based on contemporary Frankish coins, appear to have been struck in small numbers. Coins of the early 8th century were similar in appearance but made of silver and circulated in significant numbers. These thick silver *sceattas* seldom bear legends and are often difficult to distinguish from similar coinages of Frisia or the Frankish kingdom.

In the second half of the 8th century the coinage of England again followed that of Europe; the broad style denier of Pepin, king of the Franks, became the basis of the English “penny,” most notably the extensive and varied issues of the reign of Offa of Mercia. The silver penny remained virtually the only coin of the Anglo-Saxon period and the basis of English coinage throughout the Middle Ages, though its fineness and weight were frequently altered. For most of the medieval period the shilling (twelve pennies) and the pound (twenty shillings) were simply counting terms for aggregations of pennies, not actual coins.

In the 9th century pennies were issued by the kings of Mercia, Wessex, Kent, East Anglia, and Northumbria, as well as by the archbishops of Canterbury and York. The pennies of the south (except for East Anglia) were struck at three mints that changed hands frequently; the coins were uniform in appearance and content. Those of Northumbria differed in style and were of a lower silver content; they are termed *styccas*. The Viking conquerors of the north and east, who had no prior tradition of coining, initiated coinages based on those of Wessex and Mercia, including issues in the memory of King Edmund of East Anglia (killed by the Danes in 869) and in the name of kings Siefred and Cnut (who are not known from any other source).

Table of Coins and Coin Values

12 pence (12 <i>d.</i>) = 1 shilling (1 <i>s.</i>)	1 mark = 13 <i>s.</i> 4 <i>d.</i>
20 shillings = 1 pound	$\frac{1}{2}$ mark = 6 <i>s.</i> 8 <i>d.</i>
(240 silver pence = £1: The silver penny (1 <i>d.</i>) was the basic coin in actual use.)	(These were values, not coins.)
1 farthing = $\frac{1}{4}$ pence	1 groat = 4 <i>d.</i> (a coin struck 1351–52)
1 halfpenny = $\frac{1}{2}$ pence	1 florin = 6 <i>s.</i> (a gold coin struck by Edward III)
(These values might be represented by small coins or by cut pieces of a silver penny.)	1 noble = 6 <i>s.</i> 8 <i>d.</i> (a gold coin issued by Edward III)
	1 angel = 6 <i>s.</i> 8 <i>d.</i> (a gold coin struck by Edward IV, 1464)

Fig. 49. Values of English coins after 1066. By J. Rosenthal.

As the Wessex kings reconquered the island, they standardized the coinage. Under Æthelstan (924–39) a regional system of minting was established with a mint in all privileged boroughs. Toward the end of his reign Edgar (957–75) expanded the number of mints to about 40. Under Æthelred II (978–1016) a system was established whereby at periodic intervals (generally every six years) the coinage was changed throughout the kingdom and all old coins called in for reminting. This system remained in operation through the reigns of Cnut (1016–35) and Edward the Confessor (1042–66).

William the Conqueror maintained the standards of the Anglo-Saxon penny and continued the system of coinage in most of its aspects; the recoinages came every three years, and regional mints were brought under stronger central control. Under Henry I the coinage was debased in weight and fineness, and standards of workmanship declined drastically. The coinages of Stephen and Matilda were even worse. In 1158 Henry II restored the weight and fineness of the penny but did not reinstall the system of periodic recoinage. In 1180 he instituted a new coin type, the “Short Cross” penny, issued in only eleven mints. This type was maintained unchanged (even in identifying the king as “Henricus”) through the reigns of Richard I (d. 1199) and John (d. 1216) and through most of the reign of Henry III (d. 1272).

Fig. 50. English coins, 8th to 15th century:

1) Anglo-Saxon silver sceatta, 8th century;

2) Wessex, Alfred the Great, 871–99, silver penny, London, minter Tilevine;

3) John (in the name of Henry II), 1199–1216, short-cross silver penny, Ipswich, minter John;
4) Edward III, silver groat, 1351–61, London;
Coins from the collection of the American Numismatic Society, New York, reproduced by permission.

The type was finally changed in 1248 as a response to clipping, and the “Long Cross” penny or “Sterling” was issued in the name of Henry and then in the name of the first three Edwards from 1279 through 1377. Though the Short Cross and Long Cross pennies were produced at a number of mints, the dies were centrally carved; the study of minute changes in details of legends and types has resulted in a chronology that allows most coins to be dated within a short range. Until 1279 pennies were cut in half or quarters to make smaller denominations; after that round halfpennies and farthings (fourths of a penny) were struck alongside pennies.

In the middle of the 13th century Florence and Genoa introduced gold coinage to Europe; England followed in 1257 with a gold penny. Issued as equivalent to twenty silver pennies, this coin was significantly undervalued and quickly disappeared from circulation. No other gold coin was issued in England for almost a century. The change from the penny type in 1279 was accompanied by the introduction of a heavy silver coin, again following continental examples. The groat of four pence was, however, slightly overvalued in relation to the coinage before it and met popular resistance; after a short time its minting was abandoned until the middle of the next century. By the death of Edward I (1307) the English coinage had returned to being based almost exclusively on silver pennies.

In 1351 the groat of four pence was reintroduced and remained a part of English currency. Gold coinage was also revived about this time, but its history was to be complex and changing. Unlike Italian issuers of gold coinage, who let the relationship of their gold to silver coins be fixed by market conditions, English kings sought to establish a fixed relationship between gold and silver issues. Changes in the gold-silver ratio on the world market led inevitably to difficulties, resulting in hoarding, the export of overvalued coins, and erratic minting in the two metals. After a false start with overvalued denominations in 1344 Edward III produced the first successful gold English coin, the “noble” (worth 80 pence), whose weight had to be adjusted twice in the decade (figs. 49–50).

Henry IV maintained the coinage system of Edward III and Richard II but lowered the weight of silver and gold coins in 1412. The new standards were maintained through the reigns of Henry V and Henry VI. A new system of relationships was introduced in 1464 under Edward IV; the gold noble retained its weight but was valued up from 80 pence to 96 pence, while the weight of the silver coinage was reduced. The noble soon gave way to a gold “ryal”

worth 120 pence and an “angel” worth 80 pence. With the addition of a sovereign valued at one pound (240 pence) in 1489, this system remained unchanged until the radical coinage alterations of Henry VIII in 1526.

Comic Tales

Few comic tales, or *bourdes*, exist in English until Chaucer, and those that do seem anomalous, genreless, within the English literary tradition. *The Fox and the Wolf* is a beast fable of the 13th century; *Dame Sirith* (also 13th century), though written with a fabliaulike plot, is more properly read as a play, like the fragmented *Interludium de clerico et puella*. *A Penniworth of Wit* is more moralistic than amusing. Yet on the basis of these works, Chaucers churls’ tales, and scattered strictures against dirty stories it has been argued that there was a genre of fabliaux in English comparable to the large body of French tales of the 13th and early 14th centuries and that these alleged English fabliaux have been suppressed and lost.

This argument is unlikely to be right. What did certainly exist in England before Chaucer were the above-named tales, fifteen fabliaux (twelve in Anglo-

Norman and three in other French dialects but preserved in manuscripts of English provenance), and a collection of poems in Latin known as the Cambridge Songs, written in England around 1050 and including several stories on fabliau themes.

Tales on fabliau themes run across genres in the Middle Ages: such a plot can occur in a sermon exemplum, as part of a Corpus Christi play, or as one of the Cambridge Songs. But mere plot is not enough to define a genre. The French fabliaux, famously defined by Joseph Bédier as “des contes à rire en vers” (“funny stories in verse”), often involved great trickery and great stupidity and dwelt on the amusing side of sex, greed, violence, and scatology. It is this tradition of finished, clever tales that lies behind Chaucer’s *Millers*, *Reeves*, *Friars*, *Summoner’s*, and *Shipmans Tales* and influences his *Merchant’s Tale*. His tales in turn leave their traces in the comic tales of the 15th century.

Generic traits of these 15th-century comic tales are harder to define. If the tales have one loosely unifying trait, it is that, like the fabliaux, they variously counter the generic features of romance. One group of these tales turns upon a more or less clever trick: *The Friars of Berwick*, *The Lady Prioress*, *The Tale of the Basin*, *Dane Hew*, *Jack and His Stepdame*, *The Wright’s Chaste Wife*, *How a Merchant Did His Wife Betray*, *Prohemy of a Marriage*, Lydgate’s *Churl and the Bird*, and the Pardoner and Tapster episode in the *Tale of Beryn*. Though these English tales tend to be more moralistic than are the fabliaux, they are closely akin to them: they share the fabliau sense that ends can be achieved by plotting and doing, as opposed to the romance sense that there is a Providence that shapes our ends.

Another group of tales, like Chaucer’s parodie *Tale of Sir Thopas*, displaces the rites of romance—the tourneying, feasting, hunting, wooing—into a debased context: *The Tournament of Tottenham*, *The Feast of Tottenham*, *The Hunting of the Hare*, *The Felon Sew*, part of *Colkelbie Sow*, and several of Dunbar’s burlesque poems. A number of poems describe the chance encounter of a king incognito and a peasant, with a conflict of the systems of courtesy of court and peasantry that is not flattering to the court: *King Edward and the Shepherd*, *John the Reeve*, *The King and the Hermit*, *Rauf Coilbear*, *The King and the Barker*. *Sir Corneus* (also known as *The Cokwolds Dance*) and *The Boy and the Mantle* (a ballad in form) are set in Arthur’s court and expose it to ridicule for its pervasive adultery.

The comic tales, while taking a stance that is anticourtly and unromancelike, were far from being written to engage the political sympathies of lower class audiences. The peasants depicted in the king-and-peasant poems, for example, are uncouth and laughable; the courtly rites parodied in *The Hunting of the Hare* or *The Tournament of Tottenham* are made funny precisely because the poets ignore real peasant contests and feasts, the real way peasants do battle,

and depict them as awkwardly aping the nobility. As in 13th-century French fabliaux the effect of such a portrayal is double-edged: it reinforces the conviction of the impassable gulf between the nobility and peasantry that the romances quietly assume, but it also shows what aspects of romance are most idealized, most rigidly conventional, most unbending to the circumstances of everyday life and ordinary people.

Conductus

The musical term “conductus” (pi. *conductus* or *conducti*; from Lat. *conducere*: to escort/lead together/connect) is difficult to define precisely. It does appear in medieval sources, but in rubrics that may be of only local interest. Around 1280 the English theorist known as Anonymous IV described gatherings of different types of *conducti* and singled out some *conducti* by name; reasonably or not, we have thus come to classify as *conducti* those pieces in the surviving gatherings that seem to match those that Anonymous IV described. Broadly speaking, the *conductus* is taken as a high art song—a musical setting of sacred or serious Latin rhythmic poetry in one to four voices, as cultivated throughout Europe during the late 12th and 13th centuries. The *conductus* often fulfilled a paraliturgical function, and on some feast days it may have been sung instead of the *Benedicamus Domino* in the office. Its musical-liturgical antecedents seems to have been the *versus* and, especially in England, the *Benedicamus Domino* trope.

There are two main schools of thought as to the etymology of the term. The traditional idea is that *conducti* were originally processional songs, designed to accompany movement inside or outside the church, and that the appellation remained for freely composed Latin art songs even though the original function had been lost. A more recent idea is that *conductus* refers to the performance practice of a group of singers “joining together” rather than singing *alternatim* (in alternation) as was required in the double-cursus sequence—and that the *conductus* was in its earliest stages a compression, or hybrid, of the hymn and sequence. This does reflect the primary meaning of the verb *conducere* more accurately and does not rule out the possibility of a processional function as well.

“*Conductus*” is a generic term encompassing several types. In 13th-century insular sources three main types are found: a small number of stylistically complex, purely indigenous types not found in continental sources; simple, syllabic *conducti*, common all over Europe and closely related to the sequence; and a large number of “*Notre Dame*” *conducti*, usually taken to have been composed at or for the Cathedral of *Notre Dame* in Paris (it is these of which Anonymous IV spoke). But “*Notre Dame conductus*” as a term has its own complications. It covers many stylistic types, and the extent to which other geographical areas contributed to the style and to the repertoire has probably

been underplayed. For instance, an earlier insular style may have contributed to a greater or lesser extent to the formation of the Notre Dame conductus style.

Some of the more complex insular and Notre Dame conducti support large structures of interweaving melismas, called “caudae,” whose rhythms are in one or more of the regular trochaic patterns known as the “rhythmic modes.” Three-part insular conducti often contain rondelli as well as caudae. Rondelli are sections structured like a round, where each voice sings the same melody in turn. In a rondellus, though, all the parts begin and end together, and this gives the effect of the same section of music stated three times. In two insular conductus sources (Oxford, Corpus Christi College 489, and Durham University Library Bamburgh Sel. 13) passages of rondellus are even written in different-colored inks, making a relationship that is obvious to the ear more explicit to the eye. Rondellus is a technique found only in insular conducti. The other musical trait that immediately distinguishes the insular from the Notre Dame type is the frequent sonority of the interval of a third, a phenomenon contemporary English theorists themselves noted. This proliferation of thirds, an interval considered dissonant on the Continent, may in part explain why insular conducti did not find favor across the Channel; there is some evidence too of differing patterns of dissonance on strong and weak beats between the insular and continental repertoires. There is also considerable difference between the texts of the two types. Whereas Notre Dame poems are often of a moralizing or edifying nature—laments on the deaths of royalty or bishops, admonitory works railing against the corruption of the clergy, or celebrations of particular feasts using rich biblical imagery—insular texts are overwhelmingly of the votive Marian type. It has been suggested that paraliturgical conducti be distinguished from merely serious secular pieces and that the latter be designated *cantio*.

The physical layout of French sources suggests, perhaps misleadingly, that the Notre Dame conductus tradition was to a large extent homogeneous. Works of the same style tend to be grouped together. It has been more difficult to piece together a picture of how insular sources operated as they are mostly in a tattered and fragmentary state. Some insular sources do seem to have contained fascicles especially for conducti. However, in contrast to these and to French manuscripts, others group together works not only of different styles but even of different genres; for instance, insular conducti may be found next to troped chant settings or motets. This coexistence testifies to a rich mix of traditions in Britain.

The sources also indicate that conducti had a longer vogue in Britain than on the Continent; the closely related cantilena (where the melody is in the top rather than the bottom part) did not supersede the insular conductus until

about 1300. In contrast continental sources seem to indicate that in France the polytextual motet had gained favor over the Notre Dame conductus by mid-century. Insular composers were evidently reluctant to give up the compositional freedom that the conductus allowed; the French motet was based on preexistent material.

There are about twenty sources for the conductus in Britain. If the evidence of their parent volumes is to be believed, they came mostly from the larger monastic houses. Notre Dame conducti seem to appear more commonly in sources from the east of England and other areas in closer trading-contact with the Continent. On the other hand insular conducti occur mainly in sources from the west and north: the Worcester fragments, two sources from Reading Abbey (Bodleian Library, Bodley 257; Oxford, Worcester College 213*), a Meaux Abbey source (Chicago, University of Chicago Library 654 App.), and a Revesby Abbey manuscript (Princeton, Princeton University Library Garrett 119). This bears out the testimony of Anonymous IV, who mentioned the singular compositional practices of what he called the “Westcuntrie.” There are, however, manuscripts transmitting both types of conductus whose provenance is unknown, including Cambridge, Gonville and Caius College 820/810; Cambridge, Jesus College QB1; London, Lambeth Palace 752; Oxford, Corpus Christi College 497; Bodl. Wood 591; and Bodl. Mus.c.60. Brief mention must be made of two commonplace books, or miscellanies, that transmit a single Notre Dame conductus apiece: BL Harley 524 and 5393, and of two Bodleian manuscripts that, among other texts, preserve just the poems of 30 and 40 Notre Dame work, respectively: Add. A 44 and Rawlinson C.510.

The only more or less complete insular source is the Scottish manuscript Wolfenbüttel, Herzog-August-Bibliothek 628 (commonly known as W1), which contains about 100 pieces, representing approximately half the extant polyphonic Notre Dame repertoire plus a few local additions. Though the internal organization of this manuscript does resemble that of the other continental Notre Dame sources, the content of each fascicle is less closely focused: for instance, organal *Benedicamus Domino* settings and *Agnus Dei* tropes occur within conductus fascicles. These examples show how much there is still to be learned about the ordering of conducti relative to their function. It has been suggested that some “Notre Dame” conducti from W1 (and indeed the other major Notre Dame sources) are English because they refer to events or people in “England,” including the murder of Thomas Becket, the coronation of Richard I, the death of Henry II, and the massacre of the Jews at York and London in 1189. This view is perhaps simplistic. It ignores the fact that their political subject matter would have been relevant right across the Angevin Empire. However, it does seem that in W1—as in the other major Notre Dame sources—geographical and chronological “layers” exist, though owing to

copying, adding, and recopying via exemplars, these are no longer clear-cut.

It is unfortunate that the status of W1 as the only complete surviving insular manuscript of polyphonic music from the 13th century has overshadowed the implications of the 50 or so fragmentary sources of insular polyphony. Although it is clear that the Notre Dame conductus was widely cultivated in Britain, the extent to which it may have dominated the English tradition is overrepresented by the evidence of W1 alone. The really exciting compositional developments of the conductus in Britain do not seem to have depended on Notre Dame.

Conversion of the Anglo-Saxons

The British Christians made no attempt to convert the Anglo-Saxon invaders; the initiative came rather from Rome and subsequently from Ireland. In 596 Pope Gregory I (590–604) dispatched the monk Augustine to England. Augustine, winning the favor of the powerful Æthelberht of Kent, and following the pope's rational guidelines, laid the foundations of the church in the southeast. The evangelization of Northumbria began with King Edwin (616–32); he married one of Æthelberht's daughters on the understanding that she could continue to practice her faith, and she was accompanied north by the Roman missionary Paulinus, who proceeded to preach to Edwin.

The case of Edwin underscores the fact that the conversion of a king was not always easily achieved. It required the combined urgings of Paulinus, the pope, and the queen to incline him toward the new religion, and even then he would only embrace it after canvassing the opinion of his council. A pagan revival followed Edwin's death. The fortunes of Christianity in the north were revived by King Oswald (634–42), whom Bede styled *Rex christianissimus*, "the very Christian king." Thankful for a miraculous victory against the forces of the British king Cadwallon, achieved under the sign of the Cross, Oswald sponsored a dynamic mission from Iona (in Scotland) led by the saintly monk-bishop Aidan.

Although marked by setbacks and vacillations (such as the relapse to paganism in Essex after a plague in 664), the conversion of the English kingdoms was achieved—at least in name—within a century. The Irish and Roman churches differed in details of observance, principally concerning the dates for the celebration of Easter, but when the Roman practices were endorsed by King Oswiu of Northumbria (642–70) at the Synod of Whitby in 664, the way was cleared for the development of a unitary church through England.

The conversion of England, as presented by Bede in his *Ecclesiastical History*, is a story of kings, and it is clear that they converted as much from political as from religious considerations. Christianity offered significant material advantages, such as written government. The missionaries stressed that the Christian king would achieve fame and prosperity in this world and in the next; the religious persuasion of an overking could be a decisive factor in defining subordinate kings' attitudes to the faith. When a king embraced the faith, his kingdom was considered Christian, though the task of instructing the populace in the official beliefs could be a difficult and lengthy one.

Material evidence, such as crosses on jewelry, reveals that Christian practices percolated into society at large during the 7th century, and by the

early 8th century pagan-style burials (clothed, with grave goods, and beyond settlement boundaries) had ceased. However, church canons reveal that pagan practices continued to flourish, and Bede, writing to Bishop Egbert in 734, could complain that there were many villages not visited by preachers. By the end of the 7th century stone churches had been built in many locations, monasteries were a dynamic cultural force in society, books were being collected, and distinctive Christian artistic masterpieces, such as the Lindisfarne Gospels, were being created. What Christianity meant to the populace as a whole, however, is an open question.

Convocation

The church in England was divided into two provinces, Canterbury and York, and each had a convocation, or council, of its clergy. Convocation was summoned by a royal writ, and the usual reason for such a summons, as far as the crown was concerned, was to ask the clergy for a tax. Political reasons, both on the crown's part and on the archbishop's, might also prevail (as in 1399, when convocation was called by Archbishop Arundel to enlist clerical

support for Henry IV), but once called a convocation was able to turn its attention to clerical grievances and other matters concerning the clergy.

Lists of clerical *gravamina*, or complaints, might be drawn up, complaining of financial exactions, that benefit of clergy (the right of the clergy to be tried only in church courts) was denied, that church courts were impeded in their jurisdiction by royal writs, and so on; the Convocation of Canterbury of 1421, for example, complained of the false indictment of clergy by the king's courts. So while approval of royal taxation of the clergy might be the reason for the summons, the outcome of the assembly might well be petitions and representations to the crown for redress of grievances. And once convocation had been summoned, it had legislative power to bind the clergy of the province through the issue of canons (as its legislation was called).

Though there are early roots in provincial synods, no clearly established meeting of the clergy can be seen in operation until the late 13th or early 14th century. Even after that the records are far from copious and remain so until the 1660s. For Canterbury, from the archiepiscopate of John Stratford (1333–48), however, the minutes, or *acta*, begin regularly and form a section in the archbishop's register. Canterbury registers containing good convocation data for the 14th and 15th centuries include those of archbishops Islip, Whittlesey, Courtenay, Arundel, Kempe, Bourchier, and Morton. Arundel's register has *acta* for the convocations of 1397, 1399, 1401, 1402, 1404, 1406, 1409, and 1411 and includes the articles against Wyclif and the cases against certain Lollards.

In organization convocation was divided into two houses—the upper clergy and the lower clergy. Archbishop Kempe's register includes, among the *acta* for 1453, the names of all the clergy who ought to appear in convocation: the diocesans (i.e., the bishops), the deans of the secular cathedrals and the proctors of their chapters, the priors of the monastic cathedrals and the proctors of their chapters, the archdeacons, the abbots, the priors, the heads of the collegiate institutions, and the proctors of the clergy—about 430 persons in all.

Coronation

Anglo-Saxon

Changes in the ritual form of king making indicate institutional and ideological changes in Anglo-Saxon kingship. Pagan Anglo-Saxon kings were probably ritually inaugurated, but the earliest clear evidence dates only from the 8th century and implies ecclesiastical involvement in rituals derived from the Old Testament: Ecgrith, son of Offa of Mercia, was “hallowed” in 787, in his father’s lifetime, and Eardwulf of Northumbria was “blessed” in 796.

Ecgrith’s consecration, immediately following the visit of papal legates who invoked biblical support for the inviolability of anointed kings, owed something both to Rome and to Carolingian influence. Pope Hadrian I had consecrated Charlemagne’s two young sons as subkings in 781. Links between the Northumbrian kingdom and Charlemagne’s court were also close in the 790s.

In Wessex Egbert may have been consecrated in 802 on his return from exile at Charlemagne’s court. A West Saxon king’s consecration rite underlies the queen’s *ordo* (the official order of the service) used for the Carolingian Judith when she married Æthelwulf of Wessex in 856. The first extant king’s *ordo* prescribes anointing, investiture with a scepter, and the placing of a helmet on the king’s head, instead of coronation. The rite ends with an acclamation and enthronement in which leading laymen participate, and the new king’s enunciation of three precepts: to ensure peace, to repress crime, and to issue just judgments.

A second *ordo*, probably composed from Frankish models imported during the last decade of Alfred’s reign and perhaps first used for Edward the Elder in

900, with its accompanying queen's *ordo* possibly used for Edward's wife, Ælfflaed, prescribed coronation as well as anointing. The crown became the prime royal headgear around this time. By the 11th century the liturgical representation of anointing as a spiritual coronation had helped establish the usage of "coronation" to refer to the whole inauguration rite.

In a revised version of the second *ordo*, perhaps first used for an inaugural consecration of Edgar, ca. 960, the three royal precepts, now a threefold oath, were placed at the beginning of the rite, thus becoming the precondition of the consecration. Edgar's successors, Edward and Æthelred, gave the oath in the vernacular, and a copy was laid on the altar. In a vernacular sermon Archbishop Dunstan declared, "The Christian king who keeps these engagements earns for himself worldly honor.... But if he violates what he promised to God, then it shall forthwith right soon grow worse among his people." There was often considerable delay between one king's death and his successor's consecration; the issue of charters in the interim suggests that a new king assumed formal authority before his coronation, once he had been accepted by leading men.

Perhaps from 839, certainly in the 10th century, the king making's normal site was Kingston-on-Thames (on the Wessex-Mercia border), and the archbishop of Canterbury officiated. Edgar's consecration at Bath in 973 was a special "imperial" occasion, followed by Edgar's ritual rowing by subordinate kings along the River Dee at Chester. It is not certain that Cnut (1017) or either of his sons was consecrated. All were ritually acknowledged by the leading men.

Edward the Confessor, proclaimed in June 1042, was consecrated on Easter Day (3 April 1043) "with great ceremony" at Winchester; this completed the legitimizing process of his royal succession. Harold was consecrated at Westminster on the day of Edward's burial there, 6 January 1066. The third *ordo*, combining its predecessor with a contemporary German rite, may have been used for Harold and for William the Conqueror in 1066 but was more likely composed later in the 11th century.

Post-Conquest

The coronation, or official crowning, was the most important ceremonial event in the life of a medieval monarch. At the coronation the monarch was recognized by his people as king and was vested with authority in a ritual process of election, consecration, and installation. The ceremony carried out today still has a recognizable relationship with the earliest recorded ceremony

in western Europe, the Leofric/Egbert *ordo*, dating probably from the 9th century.

The simple original ceremony was soon replaced by the second *ordo*, dating possibly from the early 10th century and probably the one used, in a revised form, at the coronations of William I and his two sons. It was a more elaborate ceremony, consisting of a formal “election” by the people, a promise by the king, and his anointing and investiture with the ring, sword, crown, scepter, and rod (the regalia: the physical symbols of secular and spiritual rule and of the unity of the king’s realm). Each presentation was accompanied by prayers and anthems, and the ceremony ended with his enthronement, followed by a mass and then a banquet.

The *ordo* contained the important elements of the services that henceforth remained relatively constant; election, the king’s oath, anointing, presentation of the regalia, and enthronement. The homage of bishops and peers (a later development) came at this point in the ceremony. These elements all played their part in the symbolism of the event, reaffirming the ideal of government and consecrating the new king to his task. The ceremony started with a secular element, the “election,” a relic of the old Germanic recognition of the person best fitted to be king. Then followed the oath taking, always in the vernacular, at first in French, later in English. The oath began in a threefold promise of good government, the king promising to govern in a Christian manner. In a real sense it brought the king within the law.

The delivery of the regalia (together with the vestments) invested the monarch with the outward signs of monarchy. As the ceremony became more complex, other swords were added to the regalia, symbolizing justice. Some of the vestments were similar to those of a bishop, reinforcing popular belief in the ecclesiastical nature of an anointed king. Finally the king was anointed with oil. This consecrated him to his task and gave him a quasi-sacerdotal character as the “lord’s anointed.” The theories as to the effect of the anointing varied from the extreme of giving him almost priestly status to that of merely being equivalent to the sacrament of confirmation. By the end of the 15th century it was commonly believed that at least it gave the king a mixed status, a *persona mixta*, higher than that of a mere layman. This popular conception was reaffirmed by the English kings being anointed on the crown of the head, as was a bishop. From the 12th century they were anointed as well on the hands, breast, shoulders, and elbows with consecrated oil.

The coronation liturgy continued to develop after the second *ordo*. The third *ordo* was more elaborate and owed much to German influence and to the *Ordo Romanus*. This, or a version of it, was probably used in the coronation of Richard I, and just possibly at that of William I and his sons. The elaboration of *ordo* 3 is continued in the fourth and last medieval version of the rite, drawn

up for the coronation of Edward II in 1308. After much revision, influenced in part by French ceremonies, this recension took its final form in the *Liber regalis*, a work associated with the name of Nicholas Litlington, abbot of Westminster (1362–88). It is the first version of the English coronation service to include detailed directions as to how the service was to be carried out. The service was lengthened considerably and prayers were added.

This fourth *ordo* itself underwent revision in the 15th century, to take account, *inter alia*, of the Holy Oil of St. Thomas (said to date from the 14th century), unaccountably omitted from the *Liber regalis*. Although we know that it was used for the coronation of Richard III, there is no evidence that this revision of the fourth *ordo* was used for the coronation of Henry VII or subsequent monarchs. The Litlington *ordo* was probably used after 1485. Certainly the Litlington version was the one translated for the coronation of James I (in 1603). In the fourth *ordo* two services for the queen were included. A service for the queen had been included in all the *ordines* except the first, but for the first time separate arrangements were made for it to be on the same day as the coronation of the king (or on another day, as was required).

Associated with the coronation liturgies are the “directories,” the *Forma et modus* and the *Little Device*. These are handbooks that describe what actually happened in the service; who did what, as it were, as the *ordines* themselves were initially very plain, merely listing the prayers in order. The *Forma et modus* was a document drawn up in the 14th century, an abridged form of the fourth *ordo*, listing the prayers and the principal officers at the coronation, along with their duties. The *Little Device*, whose earliest-known version is one originally drawn up for Richard III and subsequently used for the coronations of Henry VII and Henry VIII, is a detailed plan of the ceremony, including the names of the officials taking part and which piece of regalia they carried.

These “coronation services” or supporting roles had become an increasingly important part of the ceremony. At first the disputes between claimants were settled in an *ad hoc* manner at each coronation. The first coronation at which a formal record was made of decisions between rival claimants was that of Eleanor of Provence, wife of Henry III, in 1236. In 1377, since Richard II was a minor, a formal court was set up to hear claims to services or fees, presided over by the duke of Lancaster as Lord High Steward. This court, the Court of Claims, survived, although only isolated records of its proceedings survive for the 15th-century coronations.

Coronation Ceremony, Music and Ritual of

Although other cities, Winchester, Bath, and Kingston-on-Thames, for example, were associated with coronations and crown-wearings, especially in the Anglo-Saxon period, after the Norman Conquest Westminster Abbey was the normal location, and the archbishop of Canterbury the normal celebrant, of the ceremony. The liturgical services associated with coronation are the consecration service itself (the *consecratio regis*) and the following mass. The former is very much like the ordination of a bishop, centered on the anointing with holy oil but also including rituals of more temporal significance.

The abbot of Westminster played a significant role in preparing and helping with the ceremonies, as did bishops from the other English sees, though the monks of the abbey probably had little active role. The special prayers and actions were the responsibility of the archbishop and his attendant clerics, and the chants would have been carried out by a special group of trained singers who later formed the nucleus of the Chapel Royal. The services are usually preserved in an *ordo consecrandi*. The *ordo* is most often found in a pontifical, a book written for the archbishop celebrant. Since he needs to know only the

short passages of chant that he must sing, the choral chants must usually be sought elsewhere, in the antiphonal or gradual, for example. Rubrics about the performance of the ritual are sometimes included but are often scanty. To obtain a detailed reconstruction of the services, one must use many other sources, including nonliturgical sources like chronicles and eyewitness descriptions. Only in the later Middle Ages, from the 14th century, does one find fully noted *ordines*, with relatively complete rubrics and chants. The most famous are the *Litlington Missal* of Westminster Abbey, ca. 1383, and the *Liber regalis* of slightly later. These ordines were compiled as comprehensive reference books for use by the abbey as a result of the substantial revisions of the *ordo* that had taken place earlier in the century. Apart from the chants it is likely that other music would have been performed, although of this we know nothing. Fanfares were surely prominent, but until the 16th century none exists in writing. Polyphonic motets might have been inserted, and several from the 14th and 15th centuries have suitable texts. We have no information about this practice and must assume that such pieces would have been undertaken by the professional singers of the royal or noble chapels of the aristocracy present.

Several revisions of the *ordo*, called recensions, allow us to trace the development of the ceremony and to draw conclusions about the relative weight of its temporal, political, or liturgical elements. The earliest well-established text is the version of the second recension used for King Edgar (957–75; consecrated ca. 960?), a text greatly influenced by continental ceremonies by way of Archbishop Dunstan, and sometimes called the Dunstan *ordo*. This was revised and became known as the Edgar *ordo*. After about the year 1000 this recension was the pattern for many European coronation texts. In 1059, for example, it was made the basis for the Hungarian coronation, because of the exile of Edmund Ironside's sons in that country. The Norman Conquest brought changes, of course, and although William himself took the Anglo-Saxon oath, many of the important features of the earlier *ordo* were omitted in the third recension, used through the 13th century.

The fourth recension, essentially the last Latin version, was created for the coronation of Edward II in 1308. It admirably demonstrates the political and ecclesiastical importance of the ceremonies. Restoring features of the Anglo-Saxon *ordo* and making the ceremony more English, it was a reaction to both internal and foreign circumstances. Edward was compelled by the magnates to add to the oath that he would maintain laws chosen by his subjects. King Louis of France had been canonized in 1297: *Unxerunt Salomonem*, the chant newly composed for the anointing of Edward, seems to refer to a prominent chant for the royal English saint, Edmund, king and martyr. The papal bulls of about 1300, in which Boniface made “arrogant declarations” of his supremacy over

everything, caused a “categorical assertion of the sovereign rights of the crown”: Edward enters the coronation mass to a newly fashioned Introit, *Protector noster*, using a text assigned to papal entrances. Furthermore, to emphasize national authority, the recognition by the assembled people, shouted at the end of the Anglo-Saxon service and omitted by the Normans, is restored prominently at the beginning of the service, and reiterated with musical emphasis in the new chant for *Unxerunt*.

Political messages, and temporal and spiritual authority, are therefore reinforced by symbolic liturgical reminiscence and by the order, positioning, and musical emphasis of the most important elements of the service. These are the procession to Westminster; the recognition; the oaths (here the monarch swears to maintain the rights and privileges of the church and people); the anointing (making the king divine); the vesting with symbols of temporal authority (crown, sword, ring, spurs, orb, and rod of justice); the enthroning (this took place in the chair of St. Edmund placed prominently on a scaffold raised in the crossing of the abbey); and the homage (all kneel individually before the king and swear allegiance).

In the following mass, little is special. The psalms, readings, and chants naturally concentrate on regal texts. Outstanding, however, are the *laudes*, assertive and triumphant acclamations following the Gloria.

Cotton, Robert, and the Cotton Library

The core of the Cotton Library is the collection of items made by the English scholar and courtier Sir Robert Bruce Cotton (1571–1631), to which a small amount of material was added by his son Sir Thomas (who succeeded 1631) and grandson Sir John (succeeded 1662, d. 1702). Over four decades Sir Robert gathered together some 30,000 manuscript items (books, charters, and maps) as well as printed books, coins, monuments, and inscriptions. At first his interests lay mainly in Anglo-Saxon and early ecclesiastical material, but they later broadened to include medieval chronicles and cartularies, recent state papers, and foreign works. Items were acquired by purchase, gift, or exchange.

In 1622 Sir Robert moved his extensive library to a long, narrow room on the first floor of Cotton House within the precincts of the Palace of Westminster. By ca. 1638 the collection was arranged in twelve presses or bookcases (six having six shelves and six having five), one shelf (above the door), and one chest of drawers. Each of these fourteen subdivisions was distinguished by the name of one of twelve Roman emperors from Julius Caesar to Domitian or one of two classical females, Cleopatra and Faustina. A brass head of each of these classical figures was placed above the press or other subdivision associated with his or her name.

An item kept in one of the presses was identified by a press mark that consisted of the name of the person whose head stood above, a capital letter designating the shelf, and a roman numeral indicating the sequence of books on the shelf: e.g., Tiberius B.i. Items on the shelf designated Domitian had only the emperor's name and the roman numeral: e.g., Domitian viii. The chest of drawers (Augustus) was arranged in six parts, each given a roman numeral; some parts were complete units, but items in i (containing maps) and ii (containing charters) were identified by arabic numerals: e.g., Augustus ii.43. Volumes (over 800 by 1631) were arranged by size rather than subject, each often containing several texts distinct in origin, character, or provenance that had been bound together for Sir Robert, who added tables of contents, title pages, and frontispieces.

The location of the Cotton Library close to the Houses of Parliament at Westminster, and its owners liberal policy of access to it, made it an important center of research for courtiers and politicians in the reign of Charles I. Sir

Robert himself used it in researching matters of legal precedent for Henry Howard, earl of Northampton, the Lord Privy Seal. Fellow antiquaries, such as William Camden, Sir Henry Spelman, John Selden, and John Speed, used or borrowed manuscripts relating to genealogy, topography, and legal precedent. Eventually, however, the library was seen as too valuable a source of information for opponents of Charles I, and in 1629 Sir Robert and his librarian were arrested for possession of seditious material and the library was closed. Although soon released, Sir Robert was further punished by having only restricted access to his collections, and he died a disappointed man in 1631. Although his son Sir Thomas was allowed to reopen the library around 1633, it was never again, while it remained in the Cotton family, so well used as before.

During the English Civil War of the mid-17th century the library was evacuated to Stratton, Bedfordshire, but afterward returned to Westminster. It passed from Sir Thomas to Sir John, who on his death in 1702 bequeathed it to trustees for the benefit of the public. In 1722 it was moved to Essex House in the Strand and in 1730 to Ashburnham House in Little Deans Yard, Westminster. Soon after, on 23 October 1731, a catastrophic fire destroyed 114 of the library's volumes and seriously damaged a further 98. A Report of a Parliamentary Committee into the state of the library listed the damage. In 1753 the Cotton Library was made one of the foundation collections of the British Museum and is now part of the British Library.

The Cotton Library is of fundamental importance to those interested in Anglo-Saxon studies and medieval English history. A small selection of its contents must mention the Nowell Codex (including *Beowulf*), five texts of the Anglo-Saxon Chronicle (B, C, D, F, and fragments of G), two of the five earliest manuscripts of Bede's *Ecclesiastical History*, the Lindisfarne Gospels, the Vespasian Psalter, the Durham *Liber vitae*, the OE Hexateuch, as well as numerous saints' lives, cartularies, charters, later chronicles, legal texts, and ME works, such as *Sir Gawain and the Green Knight* and La3amon's *Brut*. The original manuscripts of Assers *Life of King Alfred*, Æthelweard's chronicle, and *The Battle of Maldon* were destroyed in 1731, but their texts are known from early-modern transcripts. The earliest catalogue (BL Harley 6018) was begun in 1621 but is incomplete; that by Thomas Smith, published in 1696, provides a list of the collection before the 1731 fire; that by Joseph Planta, made in 1793–1802, has not yet been replaced. All these are arranged by press mark. The only printed catalogue arranged by subject is that by Samuel Hooper of 1777.

Councils, Royal and Baronial

It is no exaggeration to say that the whole political fabric of late-medieval royal government was built upon the concept of “counsel,” whether given formally in specially summoned great councils of the realm or in the official forum of parliament, or else through more intimate exchanges between the monarch and his leading subjects, both lay and ecclesiastical.

Kings had, naturally, from the earliest times depended upon such advice, but during the reign of Henry III an identifiable *consilium regis* (“king’s council”) developed as a response to the need for centralization. This body gradually became more professional, although its membership remained a matter of royal discretion. As the 14th-century poet John Gower said, “Ther is nothing which mai be betre aboute a King than conseil, which is the substance of all a Kinges governance.” A wise ruler instinctively understood the importance of regular consultations with a wide range of noblemen and influential commoners. Less sagacious kings were given to excessive favoritism: Edward II, Richard II, and Henry VI each came to regret the mistake of alienating men who expected, by virtue of rank or wealth, to participate in the deliberations of government.

The giving of counsel was seen as a duty incumbent upon the “sad [sober] and substantial” leaders of society. Indeed, during the 1480s, treasurers of England were actually required to take an oath promising to “councile” the

king to the best of their ability; it was the senior officers of state and their more experienced associates in the royal household who constituted the backbone of the council.

Whereas great councils, with representatives from the baronial, knightly, and mercantile classes, were held intermittently to consider specific issues, such as raising of money or foreign affairs, the royal council met regularly and was composed of sworn and (almost always) salaried advisers with the dual task of formulating and implementing royal policy. The choice of personnel sometimes caused great friction between the sovereign and parliament, which, predictably, sought to avoid a council dominated by partisanship and faction.

There were times, especially during royal minorities or periods of political unrest, when the royal council had to assume *de facto* control of government; even under strong rulers like Henry V and Edward IV, who limited its independent executive authority, the volume of administrative, financial, and diplomatic business was such as to leave enormous reserves of political power in its hands. Evidence from the 15th century shows that, although in theory a large number of men could be called upon to act as councillors (105 known individuals in the reign of Edward IV), only a few put in a regular attendance at meetings.

The same considerations applied to the great magnates, whose estates were small kingdoms in themselves. As well as soliciting advice on major items of policy (marriages, important political decisions, and administrative reforms) from friends, followers, and family, nobles employed the permanent services of senior estate and household personnel (who sat *ex officio* as councillors) and a solid phalanx of lawyers, some of whom were leading members of their profession. The influential position occupied by lawyers on baronial councils (in contrast to the royal council, until the very end of the Middle Ages) was partly a result of the massive amount of litigation and general legal business in which great landowners were involved. But it is also an indication of the ever-increasing amount of work undertaken by baronial councils as tribunals for private quarrels between tenants, retainers, neighbors, and clients of great lords.

In this respect individual magnates offered a service not dissimilar to that provided by the court of chancery, whose chief merits were speed, cheapness, and relative freedom from corruption. By far the greatest proportion of conciliar activity, however, concerned the minutiae of estate administration; few items were considered too petty to escape attention. On most estates special commissions comprising a handful of senior staff and a few lawyers were set up to undertake tours of inspection so their findings and recommendations could be reported back directly to the lord. As with their royal counterpart long minorities or the absence of the magnate overseas

meant that baronial councils had to assume far greater powers, a task made easier because continuity of office holding was the norm and many senior employees possessed decades of experience.

Court Culture and Patronage

The roots of courtly patronage and the attendant development of a court culture are deep and various. Kings' courts were the centers of culture and patronage long before our earliest medieval sources; a characteristic of the Germanic war leader was the giving of gifts to his followers, and this munificence was similarly expected of the early-medieval king.

By the same token the concentration of wealth at the apex of the social pyramid led, in a hierarchical society, to clear parallels between conspicuous consumption and social standing. Throughout the Middle Ages an individual both reflected and expressed his or her position in society by such signs as clothes and the splendor and quality of material objects. Those who stood near rulers expected to be well rewarded, as they were eager to display their special status by their appearance; a reputation for generosity was among a king's assets, one for meanness a serious liability.

Though there was an inevitable concentration of artistic patronage around the king and the powerful lords who served him, the royal household was an itinerant one, and those who created and performed the arts were without a fixed abode. There was no cultural capital, at least not until the later Middle Ages, when London/Westminster became the center of this activity, as it did for so much else. Furthermore, from the coming of the Norman (and Angevins) until the second half of the 14th century, French was the language of the court and of its literary culture.

On the other hand it would be a mistake to think of English court culture as just a passive receptor of French culture. English influence, especially on literature, was strong, in theme if not necessarily in language. The story of King Arthur and his knights (the “Matter of Britain,” first disseminated in substantial form by Geoffrey of Monmouth’s *Historia regum Britanniae*, in the 1130s) had a huge impact on medieval writers. The English royal court under Henry II and his wife, Eleanor of Aquitaine, became a center for minstrels and writers from abroad (such as Marie de France), as well as native clerics like Walter Map, author of *De nugis curialium*.

A sharper sense of independent English identity began to develop in the 13th century, forcefully expressed in an architectural statement with the building of Westminster Abbey. Henry III planned the chapel holding the shrine of Edward the Confessor as a royal mausoleum, on the pattern of the French kings at St. Denis. Henceforward the building and furnishing of Westminster Abbey and the adjoining palace provided a focus for the royal patronage—from Henry III’s magnificent tessellated pavement before the high altar, laid by Roman craftsmen, to the numerous royal funerary effigies in metal or alabaster.

The need for richly illuminated service books and embroidered sets of vestments stimulated patronage of the applied arts, and the custom of patronage, albeit on a smaller scale, was repeated in the construction or rebuilding of other royal chapels. The wall paintings at Westminster Palace demonstrate the difficulty of compartmentalizing court patronage. In the Painted Chamber Henry III and Edward I commissioned a series of paintings wherein literary material is incorporated to illustrate the qualities of kingship. Similarly Henry III had scenes from a romance of Thomas of Kent painted in Nottingham Castle. In 1333 Queen Philippa gave Edward III a cup decorated with the Nine Worthies and other heroes of epic and romance. Some 60-odd volumes of secular works can be identified in the 14th-century royal household, clearly but the tip of the iceberg.

Literature figured as prominently as the plastic arts. Wace’s description of himself as *clerc lisant* (“reading clerk”) at the 12th-century court applies equally to Jean Froissart, patronized by Queen Philippa (d. 1369). Their

function is illustrated by a manuscript of Chaucer's *Troilus and Criseyde*, depicting the poet reading aloud to the court. Only with changes in book production from the later 14th century did volumes become more generally available and reading begin to develop as a private activity, for the middling as well as the upper classes.

The patronage of household clerics was also an important element in regional, baronial courts. Geoffrey of Monmouth belonged to the household of Robert of Gloucester; two centuries later John Trevisa made his English translations while chaplain to the Berkeleys of Gloucestershire. In the 14th century baronial courts remained an important source of patronage, especially for English alliterative poets; Humphrey de Bohun, earl of Hereford, commissioned an English version of the romance *William of Palerne* for his household, and the strongly localized alliterative masterpiece *Sir Gawain and the Green Knight* was almost certainly composed for a baronial court in the northwest. The Berkeley Crécy Window (ca. 1349) in Gloucester Cathedral has a regional setting and significance, but the comrades-in-arms depicted in the lower tier focus attention on service in the king's household, at home and abroad. Royal court and capital were steadily achieving dominance, as baronial culture came to imitate that of the king's court, and all roads led, more and more, toward the political and cultural capital of the realm.

Courtesy Literature

Didactic literature meant to serve as a guide for secular behavior. Many works in the genre also include admonitions about religious activities like daily prayers, almsgiving, or churchgoing; proper nurture is virtuous and ultimately gains a heavenly reward. Nevertheless, the rhetoric of most courtesy literature promises that good manners and morals will lead to honor and profit in this world first.

Courtesy books may be divided into two groups: works teaching courtly etiquette, especially table manners, to young males, and works of parental instruction addressed to sons and daughters. Many of the works in English are verse imitations or translations of Latin, Anglo-Norman, and French courtesy books. Courtesy literature proliferates after the 12th century, with most English works appearing in the 15th century.

The most common type of conduct book is addressed to males learning good manners in a noble household. Sections on table manners provide an amusing, eye-opening glimpse into the world of the medieval page. He must not gnaw on bones like a hound or throw them under the table; he must not pick his nose, or his teeth and nails with his knife (Caxton's *Book of Courtesy*).

In addition to instructions about table manners books of nurture might include rules of precedence in seating or descriptions of the duties of household officials. The Sloane Manuscript *Book of Courtesy* (BL Sloane 1986) brings a great household to life in the vivid details it gives about the responsibilities of servants from the janitor and marshall of the hall to master of hounds, carver, and chandler (Furnivall, 1868: 297–327). *The Book of Nurture* by John Russell, usher to the duke of Gloucester, ranks dozens of people by social status, delineating a seating hierarchy of infinitely subtle gradations. It also includes elaborate descriptions of the meals that would be served at noble tables, with full instructions on how the servant should prepare and present each type of food (Furnivall, 1868: 115–239).

The aristocratic settings in all these courtesy books may not be accurate guides to their 15th-century readership. Manuscript evidence suggests that such literature was popular with the merchant class and town elites who were seeking manners to match their new wealth and status. Caxton prints works of both table manners and parental instruction, citing a mercer friend as patron and even supplier of a French book of manners to be translated (*The Book of Good Manners*).

Parental instructions to children in ME include Peter Idley's (or Idles) *Instructions to His Son* (ca. 1445–50), written in rime royal by a public official under Henry VI. Idley combined secular advice from the works of Albertanus

of Brescia (on which Chaucer had also drawn in the *Tale of Melibee* and other Canterbury tales), religious instruction from Robert Manning's *Handlyng Synne*, and material from Lydgate's *Fall of Princes*. His work was popular in its time (ten manuscripts survive) and provides an interesting mirror of contemporary cultural values.

Similarly interesting are books of instruction addressed to daughters, which are generally set explicitly within a gentry or bourgeois context rather than an aristocratic one. One of the best known of these female conduct books, composed in 1371 by a French gentleman for his daughters and widely disseminated throughout Europe, was translated anonymously into ME in the mid-15th century and again by Caxton in 1484 as *The Book of the Knight of the Tower*. Through exemplary stories of good and bad female behavior it teaches young women how to earn a good name and honor rather than "blame, shame, and defame." Becoming a "good woman"—with the deliberate blurring of any distinction between morality and social reputation—is also the aim of *How the Good Wife Taught Her Daughter* (ca. 1350). The middle-class virtues of "mesure, lowenesse, and forthought" are taught with proverbial tags to each stanza (Mustanoja, 1948: 172), and the young woman is portrayed in a social setting far more diverse and unconstrained than the aristocratic household of the male etiquette books.

Courtly Love

Traditional critical term for a set of conventions applied to fictive heterosexual love relationships in medieval European literary texts, particularly those produced for aristocratic audiences in 12th-century France. First appearing in the lyric poetry of the Provençal troubadours in the early 1100s, these conventions were described by Andreas Capellanus in a mock treatise, *De amore* (alternatively titled *De arte honeste amandi*, “The Art of Loving Nobly,” ca. 1184–86). Modeled in part on Ovid’s *Ars amatoria*, *De amore* serves as a handbook for would-be lovers, its contents a hodgepodge of behavioral injunctions, scripts for seduction, and *ad hoc* allegories. Because the treatise concludes with an antifeminist diatribe, some readers suspect that the entire work is ironic. Nonetheless, it has been taken by many modern scholars as the definitive medieval treatment of courtly love.

During approximately the same period courtly love gained literary currency in narrative fiction through the chivalric romances of Chrétien de Troyes. Migrating soon thereafter to Germany and elsewhere on the European continent, courtly love proved immensely popular in French elite literature; besides constituting a central motif for lyric poetry and chivalric romance, it became a prominent feature of the dream vision and other secular allegorical literature, beginning with the *Roman de la Rose* (early 13th century). Some aspects of courtly love appear in religious poetry as well, particularly in lyrics praising the Virgin.

Features of Courtly Love

In its original French manifestations courtly love is an elaborate literary game in which courtship is played out as a parody of sociocultural realities regarding male-female dominance patterns: the female love object—generally idealized and always distanced—is cast as feudal overlord, empowered to grant her

favors to or (more often) withhold them from a subservient male, whose whole existence is devoted to serving his lady, his worth being enhanced by his efforts to attain her favor. Although sexual union is frequently the ultimate objective, sexuality is usually sublimated; the masculine partner's sufferings are foregrounded, as are his efforts to become worthy of his lady or convince her to accede to his desires. Psychic discomfort is the keynote here: love is "a certain inborn suffering" (Andreas, ed. 1941: 28), revealed by physical manifestations in the lover, such as pallor and emaciation, fueled by uncertainty and jealousy. The lover's amorous devotion to his lady is obsessive: "A true lover is constantly and without intermission possessed by the thought of his beloved" (186). Many of these precepts are enacted by Lancelot and Yvain, the protagonists of Chrétien's *Chevalier de la charrette* and *Chevalier au lion*, respectively, who endure humiliation, pain, and ethical and spiritual tests for their ladies' sakes.

Modern Views on Courtly Love

Another feature of courtly love as it is traditionally described must be treated separately here because of the special role it has played in 20th-century literary history and criticism. Andreas insisted that "love can have no place between husband and wife" (100) and that true love must therefore be adulterous in nature. For much of this century medievalists have identified adultery as one of the essential features of courtly love, due mostly to the influence of C.S. Lewis, whose *Allegory of Love* (1936) for many years served English-speaking medievalists as the definitive account of courtly love. Since the two most enduring medieval love stories, that of Lancelot and Guinevere on the one hand, and Tristan and Isolde on the other, do treat adulterous relationships, Lewis's proposition that adultery is a key feature of courtly love went largely unquestioned for nearly three decades until it was challenged in different ways by Robertson (*Preface to Chaucer*, 1962) and Donaldson ("The Myth of Courtly Love," 1970). Observing that most of the texts that Lewis addresses do not in fact involve adulterous relationships, Donaldson argued that adultery was a relatively minor theme in ME love literature up to Malory. The same might be said for much medieval French aristocratic love literature as well; it is even questionable whether adulterous love is valorized in any of the romances about Lancelot or Tristan. Thus, while one may still encounter the assertion that adultery is an essential feature of the courtly-love configuration, most modern critics no longer hold this position.

Although the specter of adultery appears to have been laid to rest, almost

every other aspect of “courtly love” has been increasingly problematized in the past two decades, especially once we move away from the seminal texts discussed above. The difficulties begin with the phrase “courtly love” (*amour courtois*) itself, coined by French medievalist Gaston Paris in 1883. Some modern scholars perceive the term as an entirely modern construct rather than as an historical descriptor and advocate replacing “courtly love” with more authentic terminology, such as *fin amour*, *fin amor*, *bon amor*, or *amor honestus*, all of which were used by medieval writers. Other scholars suggest broadening the field of reference with more general terms, such as “noble love” or “medieval love.”

Similar lack of consensus exists regarding description and definition of this literary construct. One scholar defines it in terms of structural features, such as an intense but obstructed personal relationship between a man and a woman (Calin); another proposes extending it to “any kind of elevated human love which holds center stage” (Williams, quoted in Smith and Snow, 1980: 7). A third alternative is to define it from a sociocultural standpoint, as part of a larger code of values and conduct among an aristocratic class. Thus, as Donaldson has pointed out, “The real trouble with the term ... is that no two scholars ever seem to mean the same thing by it” (1970: 155).

The “real trouble,” however, probably lies in the nature of the endeavor itself, which attempts to crowd under a single umbrella a multitude of texts produced by and for a variety of cultures (French, German, Italian, Spanish, and English for starters) in a variety of literary modes (lyric, romance, allegory), over more than three centuries. This plurality has led many scholars, most notably D.W. Robertson, Jr., to challenge the utility of courtly love as a construct and to maintain that it is merely a fiction of our own devising. Again there is no clear consensus on the issue; however, the current trend appears to be toward refinement and redefinition rather than rejection.

Courtly Love and ME Literature

At first glance ME literature appears to have reflected the general western European interest in secular love. Among the most valued texts in the traditional ME canon are the works that in some way highlight romantic or “courtly” love, including Chaucers *Book of the Duchess*, *Knight’s Tale*, and *Troilus and Cnseyde*; Gower’s *Confessio Amantis*; *Sir Gawain and the Green Knight*; a sizable group of lyrics; and Malory’s *Morte Darthur*. Chaucer’s *Legend of Good Women* should probably be included here as well. But when we turn our attention to other ME texts, it begins to look as if England’s

cultural climate was not altogether hospitable to the continental version of heterosexual love.

For despite the strong French influences on ME literature, and despite the fact that much 14th-century English narrative fiction was translated or directly adapted from French texts, there are notable lacunae in the production of ME translations from continental sources apposite to courtly love. There is no ME version of Andreas, for example. Ovid—even the moralized versions—had to wait until the 16th century to enter English letters outside of Chaucer and Gower. The only ME translation of the *Roman de la Rose* is the fragmentary version attributed partly to Chaucer. Although the allegorical dream vision was an established genre in ME literature, only Chaucer and Gower avail themselves prominently of the conventions of the love vision. It is in the ME romance, however, that we have the strongest indication that the subject of courtly love did not thrive in English soil. A striking instance may be found in *Yvain and Gawain* (1300–50), an adaptation of Chretien's *Chevalier au lion* and the only one of his romances to be translated into ME. Whereas love and love-longing are strongly emphasized by Chretien, these elements are dramatically reduced by the English redactor, who stresses chivalric conduct instead. The same pattern of curtailment and consequent reemphasis occurs in most ME romances based on French sources. This tendency to ignore or suppress matter concerning earthly love is particularly striking in ME treatments of the Arthurian legend before Malory. Most ME Arthurian romances revolve around themes of kingship, national ideology, and the politics of succession. Even the stanzaic *Morte Arthur* (late 14th century), despite its inherited narrative focus on Lancelot and his relationships with Elaine of Astolat and Guinevere, focuses more on the dynastic ideal than on the love theme. In pre-Malorian English treatments of Arthurian materials Lancelot serves primarily as a chivalric model rather than as a model lover. The love of Tristan and Isolde apparently failed to capture the imagination of English audiences as well; aside from Malory's treatment, Tristan is accorded only one ME romance, *Sir Tristrem* (late 13th century), and from this single exemplar the love theme has been all but excised.

It would appear, then, that the ideological and cultural preoccupations of 14th-century English writers and readers held little space for the formalized meditation upon human love that constitutes courtly love in its continental forms. And the canonical ME texts that do explicitly address the conventions of courtly love treat their subject with varying degrees of suspicion and disapprobation. The lovesick narrator of Gower's *Confessio Amantis* learns after extensive instruction that passionate earthly love is often blind, arbitrary, an impediment to reason, and therefore to be abandoned in favor of a more spiritually grounded love of the common good. Chaucer's courtly lovers do not

fare well at all. Many critics see Troilus as being sullied ethically and spiritually by his passion for Criseyde, and the conclusion to *Troilus and Criseyde* calls readers to set their hearts on the love of God. Arcite in Chaucer's *Knights Tale* may be as close to the classical courtly lover as we meet in ME literature, even manifesting the requisite physical symptoms of lovesickness, such as pallor, "eyen holwe," and emaciation (*KnT*1361–64); he is also one of the rare courtly lovers in all medieval literature actually to die because of love, having exchanged friendship and familial loyalty for the dubious currency of passionate love. In *Sir Gawain and the Green Knight* courtly love, both as a concept and as a literary convention, is wittily pilloried as an ideological sham, conflicting with and threatening a value system that prizes courage, loyalty, chastity, and religious faith. All of these implicit critiques coalesce in Malory's *Morte Darthur*. Only in the "Book of Sir Gareth" does Malory portray earthly love as unequivocally positive. For the rest, despite its capacity for inspiring personal fidelity and sacrifice, it not only damages individual lovers but is socially disruptive as well.

The most revealing indicator of attitudes toward courtly love in medieval England may be the ME lyrics. Although the best known of these lyrics, like "The Fair Maid of Ribblesdale" or "A Wayle Whyt ase Whalles Bon," call upon some of the conventions associated with courtly love, most ME lyric poetry confirms the lack of interest in refined love inferable from the romances and other narrative genres. In the first place religious lyrics outnumber secular lyrics by about four to one until the end of the 15th century; more important, not all ME secular lyrics are concerned with love. Only about a quarter of the Harley lyrics, for example, directly or tangentially represent the conventions of courtly love poetry. Even the Harley lyrics that draw on some of those conventions often diverge from continental models in other respects; indeed, because of the frank sensuality with which a number of these poems conclude, some critics read them as ironic or even parodie. All this suggests a general readership that had little interest in the poetic conventions of courtly love.

Manuscript evidence confirms the view that interest in French poetic models generally and courtly love poetry in particular was confined to elite audiences. Even for these audiences courtly love lyrics do not appear to have provoked any special interest *per se*. The collections in which they appear are almost all random assemblages rather than coherent anthologies, suggesting that these courtly lyrics were not perceived as a distinct genre or as having a specific literary function or value.

In sum it would appear that continental love literature is not the appropriate template for the majority of 14th- and 15th-century literary works produced for English audiences. Courtly love was evidently of little interest to the noncourtly audience; and when the conventions of courtly love were invoked,

they frequently seem to have conflicted with the value systems of author and audience alike. This is not to say that ME literature is entirely loveless—one might adduce the love relationships in *Sir Orfeo*, *Floris and Blancheflour*, and *King Horn*, or even Chaucer's *Franklins Tale*, as examples of representations of human love that *were* congenial to English audiences. Nor is the construct of courtly love entirely irrelevant to our understanding of ME secular texts and their audiences: absences are as eloquent as presences, and differences as useful as similarities in the process of definition. If we can discard the notion of courtly love as a yardstick for literary sophistication and hence an index of literary merit, and instead perceive it as a descriptor, a value-neutral term coined for a specific cultural phenomenon, it may yet serve to enhance our reading of medieval English literary texts.

Courts, Ecclesiastical

When the courts of the church came into being as institutions, clearly distinct from secular courts, is not clear. By a decree of ca. 1072 William I separated ecclesiastical courts from the local hundred courts. Before then the situation had been murky; church and secular officials sat jointly in the hundred court, and, although bishops and archdeacons no doubt imposed ecclesiastical discipline, there probably was (in Makower's words) "no division between the judicial and administrative authorities." As highly structured judicial institutions ecclesiastical courts are found in England only after the Conquest.

A clearly defined hierarchy of church courts (frequently called "courts Christian" by common lawyers) existed, generally paralleling the church hierarchy. For all practical purposes the lowest ecclesiastical court hearing all kinds of cases was the court of the archdeacon. Each archdeacon would have a court in his archdeaconry, as would each bishop in his diocese, and each of the two archbishops in their provinces. Cases of first instance were brought to

either the archdeacons or the bishops court. Appeals would be made to the next superior court (e.g., from the archdeacons to the bishops court) or from any court, *mediis intermissis* (skipping over the intermediaries), directly to the court of Rome. Appeal to Rome could be made either directly or by way of tutorial appeal, which was in fact two appeals: an appeal of the substance to the apostolic see and an appeal for protection (*pro tuicione*) while prosecuting the appeal, to the archbishop.

The question of jurisdiction of the church courts, although at times disputed, often forcefully, can be stated clearly: the church claimed jurisdiction over ecclesiastical persons and ecclesiastical things. Thus all clerics (men who had taken tonsure) and all religious (men and women who had made religious profession for monastic or regular orders) were subject to church courts, no matter what was at issue (e.g., homicide, theft, adultery), and were consequently exempt from the jurisdiction of the secular courts. Around this issue the Becket controversy raged.

The church also claimed jurisdiction over matters ecclesiastical. Thus burning a church, stealing a chalice, or striking a cleric fell to the jurisdiction of the ecclesiastical courts. Testamentary and matrimonial cases provided a vast part of the cases heard in the church courts. Cases concerning contracts and defamation were claimed for the church courts, although the church never gained exclusive jurisdiction in these matters.

Courts and the Court System

Courts and the court system in medieval England began with the fusion of Anglo-Norman legal concepts with those of the Anglo-Saxons, shortly after the Conquest. Across the later medieval period these concepts slowly evolved, with two main periods of change: during the common-law reforms of Henry II and during the reign of Edward I. The general direction of change was toward royal, centralized control at the expense of baronial, feudal law.

The most important court in the Anglo-Norman period was the royal court, the *curia regis*. More than merely a feudal court, it served as the court of highest appeal in the event of inadequate justice in local courts. From the nucleus of the *curia* Anglo-Norman kings gradually extended their hold over local jurisdiction by the use of several expedients. Whether backed up by the royal prerogative, the notion of the king's peace, or the concept of felony, royal justice overtook local forms until, by Henry II's time, royal-court jurisdiction enjoyed a power and popularity many times that of its earlier model.

So popular, in fact, was royal justice that demands for its services necessitated the creation of "satellite" courts to offer it in outlying districts. Thus the expansion of royal justice was implemented by a variety of officials: sheriffs, resident justices at the local level, and itinerant justices bringing royal justice to the far reaches of the realm. Also effective in spreading the influence of the *curia* were "spinoffs" from the central court. Most notable was the exchequer, which gradually assumed increased influence in matters of jurisprudence.

In addition to the *curia* and its offshoots the Anglo-Norman period witnessed the operation of justice at the local level in a series of lesser courts. Most important was the county court. Any number of cases could be heard here, ranging from criminal cases and pleas of the crown to land disputes. A distinguishing feature of this court was the greater wealth and influence of its litigants. The county court was the nexus between central and local jurisprudence; the king's itinerant justices used it to establish ties at the local level. And as the law offered by itinerant justices grew more popular, the separate power and influence of the county court gradually diminished.

Below the county court in scope of jurisdiction and the social rank of litigants was the hundred court; it too was slowly eclipsed by itinerant justices.

A mosaic of feudal (private or franchisai) courts also dotted the land, controlled by feudal lords and hearing disputes among their vassals. They too fell victim to the attractiveness of royal justice, available in more and more outlying extensions of the royal court. By the same practice the borough court, reserved for disputes among burgesses, gradually gave way to the more efficient form of law offered by royal justices.

Maitland saw the reign of Henry II as “a critical moment in English legal history.” Henry’s government reshaped existing legal practices into a more uniform and centralized system of jurisprudence. Partly for personal and partly for political reasons, he sought to extend the influence of his justice, at the expense of local and feudal law, throughout his realm. By its end his justice was available to any freeman through the purchase of a writ. This transformation affected the courts and court system, along with legal procedure in civil and criminal cases.

Perhaps the clearest example of the expansion of royal justice is in the realm of the courts. Both their number and jurisdiction greatly increased. Three royal courts were created out of the *curia regis* to handle the growing demand. Most important was the great council. Here were heard weighty cases involving matters of royal interest, as well as disputes among the highest of the realm. Slightly below the great council in terms of influence was the small council. Matters serious enough for the king’s ear, but not needing adjudication by the great barons, went to this body. Since the king often sat in on these deliberations, this court eventually became known as the court of the king’s bench.

In Henry’s reign the exchequer court, particularly its upper body, also began to hear pleas not necessarily connected with financial matters. Since there was little distinction between the composition of the small council and the exchequer court, Henry created yet another and smaller court. This permanent court, composed of five legal experts and resident at Westminster, was to handle the pleas of any freeman. This court had its own seal and evolved in the 13th century into the court of common pleas. Finally, in response to a demand for royal justice, Henry extended his reach into all corners of the realm by commissioning itinerant justices, each of whom could convene his own (royal) court.

Owing to the enormous popularity of the more uniform law offered by this newfangled system of courts, public and feudal courts suffered a precipitous loss of influence. County courts, now more dependent, became extensions of royal courts; here were convened the juries empaneled for civil and criminal disputes. Hundred and franchisai courts underwent an even more dramatic loss of business. And since royal courts took most cases out of local feudal lords’ courts, those too were rendered all but extinct by the more rational

system of the royal courts.

Of even greater importance than the changes in the courts were Henry's procedural alterations. Here again he took existing notions of legal procedure in civil and criminal cases and made them more flexible and adaptable. His principal instruments of reform were the writ and the jury. The former offered royal justice for sale; the latter had the advantage of gathering the facts of a case. A trial by jurors, ordered by a royal justice to tell the truth in a case, had the advantage over customary law—with methods of proof resting on either the oath or ordeal—of providing a more certain resolution of suits.

The advantages of the writ and jury in civil cases were quickly recognized, and over time the legal system developed a series of five royal writs (or assizes) to deal with civil disputes. Four dealt with possession: the assize utrum (1164) to determine whether land was held in alms or lay fee; novel disseisin (1166) to afford swift redress for those whose land had been unjustly seized; mort d'ancestor (1176) to settle disputed claims over inheritance in favor of the true heir; darrein presentment (1179) to facilitate settlement of disputes over church advow-sons (the right to present candidates for ecclesiastical benefices). The fifth writ concerned proprietary right. By purchase of this a defendant could decline trial by combat and have a jury settlement in a royal court. In giving the defendant a choice in the mode of trial, this assize soon became enormously popular and contributed to the growing use of trial by jury.

In criminal law Henry made fewer changes. Here his desire was to improve on haphazard and uncertain Anglo-Norman methods of apprehending and trying criminals. In place of prosecutions before sheriffs or local justices he substituted trials before itinerant royal justices (in county courts) for serious crimes. The method used was the more efficient presentment, or grand jury, whose purpose was to indict criminals for trial.

Another major alteration was in the manner of trial. In place of trial by ordeal or compurgation the Assize of Clarendon (1166) provided that all indicted by a jury of presentment submit to trial by ordeal of water. Any who failed suffered either hanging, mutilation, or exile. As in matters of civil law Henry had extended the long arm of justice to local areas, and by developing the grand jury he made accusations of serious criminal wrongdoing both easier and more uniform.

With Edward I (1272–1307) we encounter “the great watershed in English legal history.” Sometimes called “the English Justinian,” after the Byzantine emperor known for codifying Roman law, he tightened and refined the well-fashioned common law, rendering it so effective and attractive that it stood almost unchanged until the modern era. All areas of common law underwent adjustment. In conceptual terms the development of the common law swung from innovations devised in the royal chancery to changes enacted in

parliament. Thus was laid down the principle that all legal innovations henceforth, even if proposed by the king, would meet the approval of parliament; this was the basis of English constitutionalism. In more practical terms important changes were effected in the courts and in civil and criminal procedure.

Edward upheld changes in the courts and their jurisdiction made in the reign of Henry III. In Henry's reign Magna Carta, with one or two additions, served as the basis of statute law. According to Bracton it was then that the practice of the common law came to be based on two fundamental precepts: the writ and the concept of precedent. These notions were incorporated into Edward's reorganization of the common law, and he also made significant alterations of his own.

Essentially changes under Edward were toward separation and specialization in common law courts and procedure. The courts of King's Bench, Exchequer, and Common Pleas continued as the heart of the system, but each began to assume separate jurisdictions and functions. King's Bench heard suits related to royal interests and emerged as a court of last resort in cases of error in lower courts. Cases brought to the Exchequer dealt mainly with revenue. Common Pleas had jurisdiction over cases involving private individuals.

Above these central courts, for further review, stood the king's council (either great or small) and parliament. Below the central courts were those of itinerant justices. Whereas before Edward I it was the judicial eyre (the judges traveling on a circuit) that brought pleas into these courts, this practice died out. In its place there appeared three judicial commissions: assize (dealing with the possessory assizes of novel disseisin, mort d'ancestor, and darrein presentment), gaol delivery (which ordered the clearing out of certain jails to speed up criminal trials), and oyer and terminer (empowering royal justices to look into and bring to trial alleged felonies in local areas). Taken together these commissions ultimately brought almost all cases before the central court of Common Pleas, thus making the common law much more expedient and at the same time more desirable.

There were also changes in procedure. By the use of statute-driven legislation Edward made substantial changes in the exercise and availability of royal common law. In the Statute of Westminster (1285) he provided that all litigants desirous of a jury trial in civil cases before justices of assize could now have one locally rather than at Westminster. In criminal law the Statute of Westminster I (1275), through the use of forms of torture like *peine forte et dure*, instituted a way to force felons to accept trial by jury. Also, in the late 13th century, more and more trials occurred before petty juries, composed of some members of the presentment jury plus one or two others from other parts

of the kingdom. The intention here was to separate indicting jurors from those doing justice in trials, thus marking a step toward greater impartiality.

Coventry

A city that originated as an Anglo-Saxon settlement on the banks of the River Sherbourne, sustained by the foundation of a nunnery by the 10th century and a Benedictine abbey in 1043. The abbey, founded by Earl Leofric and his wife, the famous Godiva, served as the focal point for local commerce and the driving force behind a fledgling wool industry. In 1088 Coventry became a possession of the earldom of Chester. When the earldom fell to a minor heir,

the bishop of Chester moved his see there, laying claim to the town's northern half on the basis of what seem to be forged charters. This instigated a long battle for control between successive earls and priors, and the rivalry between the "Earl's Half" and the "Prior's Half" of the town was formally resolved only in 1355.

Through charters granted by each rival authority burgesses gained extensive rights and privileges from an early date. Powers of local self-government, already considerable in the 12th century, were extended by one of the earliest charters of incorporation in 1345. Within a generation or two Coventry was virtually autonomous, and by 1451 it gained the rare privilege of county status. During the 15th century it hosted two meetings of parliament, received several royal visits, and gained a royal mint (in 1465).

Much of Coventry's economic strength derived from its strategic location at the hub of major road links with Wales, the west Midlands, the Cotswolds, London, and the south coast. Though the Sherbourne proved an ineffective transport link, the many streams running into it provided ample water power for a successful woolen cloth industry. Especially in the "Earl's Half," or southern part of the town, cloth production as well as metal and leather working meant continued prosperity through the central Middle Ages. By the 14th century the dyers developed a strong production of blue thread, and this "Coventry blue" became the city's most distinctive product. Additional economic strength came from the cathedral and other ecclesiastical institutions, from long-distance trade, and from the affluent Warwickshire hinterland.

Coventry recovered quickly from the Black Death (1348–50) and remained prosperous for roughly a century thereafter. In 1377 it paid the fourth-highest poll tax in the kingdom, and the next decade saw considerable civic building and population growth. St. Mary's Hall, housing both the Trinity Guild and the city's court and council, symbolized the close ties between major guilds and city government. These ties were further symbolized by a rich ceremonial life, in which the guilds sponsored the annual Corpus Christi play cycle.

The latter decades of the 15th century brought increased competition and declining markets, poverty and unemployment, a flight of the wealthy from the burdens of taxation and civic office, and considerable physical decay. Coventry's deep and prolonged depression, climaxing in the 1520s and 1530s, has come to epitomize "urban crisis" at the end of the Middle Ages.

Criticism, Modern, of Medieval Literature

Modern criticism of medieval literature cannot be understood fully without recognizing its roots in the intellectual habits and assumptions of earlier periods—especially those of the Enlightenment, with its Cartesian search for certainty and for abiding canons of thought and value. These roots can be clearly seen in Ernst Robert Curtius's foreword to the English translation (1953) of his *European Literature and the Latin Middle Ages* (1948), one of the most influential books in medieval studies in the 20th century:

In order to convince, I had to use the scientific technique which is the foundation of all historical investigation: philology. For the intellectual sciences it has the same significance as mathematics has for the natural sciences. ... I have attempted to employ it with something of the precision with which the natural sciences employ their methods. Geometry demonstrates with figures, philology with texts.

In every way but direct statement Curtius uses the "hard" sciences as the standard for demonstrating truth. Such a criterion for truthfulness is governed by its opposition to doubt: scientific knowledge is certain, predictable, its results everywhere repeatable. Knowledge of this sort fulfills the Cartesian dream of certitude, a dream that shaped criticism of medieval texts for nearly 200 years. Like his 19th-century predecessors Curtius sought to achieve "precision" and certitude with medieval texts by applying the techniques of philology, the traditional textual and historical scholarship from which modern criticism of medieval literature has sprung. Although the possibility of such certitude has been radically questioned in the 20th century, its ghost continues to haunt modern critical approaches to OE and ME literature.

Old English Literary Criticism

Modern critics of OE literature have extended 19th-century philology in several directions: philology itself, New Criticism (formal reading of rhetorical structures), exegesis (study of Christian hermeneutic contexts), and oral-formulaic theory (study of the influence of oral compositional techniques) have come to be paradigmatic forms of OE criticism. But they are paradigms currently undergoing reevaluation.

Philology has traditionally focused on editing and the problems of editing: its Cartesian goal was exact scholarly elucidation of written documents. But fantastic, romanticizing elements haunt the margins—some would even say the core—of philological positivism. Editorial reconstructions of a lost original manuscript in the tradition of Karl Lachmann were based upon an imaginative vision of what Germanic poetry ought to look like. Similarly Karl Müllenhoffs 19th-century philological program of removing supposed Christian accretions from presumably pagan Anglo-Saxon works—or sifting Christian works for presumed pagan elements—relied upon imaginative reconstructive techniques and an ideology privileging primitive Germanic culture.

Although the development of OE philology into an historical criticism was founded on a positivist model, literary interpretations of early Anglo-Saxonists tended toward a sentimentalized romanticism and a belief in Germanic racial superiority. Insofar as the philological heritage still operates as a programmatic force in contemporary OE studies, it pulls in more than one direction. The philology of John Mitchell Kemble, whose studies with the brothers Grimm led him to dismiss Sharon Turner's influential survey of OE poetry as "often deficient, often mistaken," was in turn soundly rejected by Henry Sweet as "superficial," just as the idealizing editorial principles of Lachmann and Müllenhoff would be rejected by a later generation of Anglo-Saxonists.

Despite these methodological differences within philology many of the most influential editions and historical studies of Anglo-Saxon literature are grounded in the philological tradition: the monumental editions of Anglo-Saxon poetry by Friedrich Klaeber (*Beowulf*) and George Krapp and Elliott van Kirk Dobbie (the Anglo-Saxon Poetic Records) and the historical criticism of J.R.R. Tolkien, Dorothy Whitelock, Fred C. Robinson, and many others. If the approach is old, insights derived from it have often been strikingly new. And once again, in a renovation that is also a repetition, a new OE philology is asserting itself at the close of the 20th century.

The modern critical study of OE literature may be held to have begun with Tolkien's groundbreaking study of *Beowulf* (1936) and to have been greatly advanced under the impact of New Criticism in the 1950s, which led to an

emphasis on the craftsmanship of OE poems. When complexity and craftsmanship became the key terms for evaluating literature, the Anglo-Saxon literary artifact reconstituted itself. Neglected poems came to be seen as skillfully crafted gems. With few exceptions, however, the strict New Criticism of OE poetry was rarely practiced. Instead Anglo-Saxonists employed close reading to demonstrate the high level of craftsmanship of OE poems, in an attempt to render them worthy of attention after the old philological perspectives of English departments shifted. When applied to OE texts, however, New Criticism seldom took up theoretical questions; it usually limited itself to demonstrating artistic skill in poems that impious modernists took to be primitive and repellent. One of the earliest book-length attempts to apply New Criticism to OE poetry was written by Neil Isaacs (1968), although the subsequent work of Stanley Greenfield (1972) proved more influential. Contemporary critics of OE poetry still tend to make New Critical assumptions about the goals of criticism: historical, exegetical, or oral-formulaic scholarship is enlisted to demonstrate a sometimes implicit, sometimes explicit, critical point—the intellectual and verbal subtlety of OE poems.

Whereas New Criticism was originally a reaction against philology's positivist historicism, with exegetics the pendulum swings back to the historical contexts of OE literature, especially those of Christian allegory, theology, and religious practice. Philology had long included an exegetical component (e.g., in the work of Friedrich Klaeber, Max Forster, and Rudolph Willard); but the old exegetical critics had few critical aspirations. Although the newer exegetics (e.g., the work of such critics as R.E. Kaske and Thomas Hill) was characterized by only a modest New Critical perspective, its influence was all the greater for such deliberate restraint. Strong exegetical/New Critical hybrids appeared in books and essays by Bernard F. Huppé, Jackson Campbell, and Daniel Calder. Although these exegetical critics put New Critical techniques to good use, OE New Critics seldom returned the favor.

Oral-formulaic theory, which challenged both exegetics and New Criticism, is a formalism like New Criticism—but it is often a philological formalism betraying a nostalgia for the primitive, evidence of the continuing influence of philology's origins. The theory is based on studies by Milman Parry, who in the 1930s argued that, like 20th-century Yugoslavian epics, Homeric poetry was composed orally with the help of traditional formulas and themes. In the 1950s Francis P. Magoun and others applied similar arguments to *Beowulf*, albeit not without controversy. Later this approach took on a broader narrative focus in type-scene analysis, and more recent modifications by John Miles Foley and Katherine O'Keeffe have paid closer attention to the influence of manuscript culture on Anglo-Saxon orality.

Whether employing oral-formulaicist, New Critical, or exegetical methodology, the critic of OE literature typically seeks to mirror the complex craftsmanship of OE texts. When exegetics and New Criticism work together they are steadfast in their fidelity to the rhetorical structures of texts. Such conceptual categories as church, heathen, Jew, saint, and devil are treated as unproblematic givens, rather than as textual processes based on a conflictual rhetoric. Scholarship and criticism based on these paradigms are oriented toward complicity with, rather than critical examination of, such textual processes. In exegetics and New Criticism—and *a fortiori* in technico-scientific philological analyses, organic literary histories, and oral-formulaic studies—the politics of text and critic is seldom broached.

Such political questions are currently being raised in the field of Anglo-Saxon prose studies. If New Criticism dichotomized “prose and poetry in genre studies which associated the former with language study and the latter with the study of literature” (Frantzen and Venegoni, 1986: 149), one outcome of the recent influence of critical theory, particularly the New Historicism, has been interest in OE prose as cultural representation.

Since the newer theoretical approaches are based upon a model of language as semiosis (a system of interactive signs) rather than mimesis (reflection of the world), critics applying structuralist and poststructuralist methods have tended to read OE texts as shaping the Anglo-Saxon world, not merely reflecting it. Recent approaches to OE literature have been made through structuralism, semiotics, speech-act theory, phenomenology, reception theory, psychoanalysis, Foucauldian archaeology, deconstruction, and feminism. Several of these critical approaches have been used to call into question the fundamental terms of traditional scholarly and critical discussion, while others offer subtle modifications of existing paradigms. Some would argue that it’s all only just philology; but that term has become notoriously undecidable.

Middle English Literary Criticism

The great 19th-century editors of ME literature, like their colleagues in Anglo-Saxon studies, sought to restore primary texts, especially the works of Chaucer, to their “original” state insofar as possible. It in no way demeans the initiative and achievement of these editors to observe that much of 20th-century criticism has nonetheless had to correct their findings and judgments. Certitude in literary studies, as noted above, is an elusive ghost. These 19th-century editors and textual critics labored to construct a science of textual criticism, complete with its terms and tools—*lectio difficilior* (“the harder

reading [is more likely]”), stemmata (genetic relations among manuscripts), *Überlieferungsgeschichte* (“transmission history,” a term notoriously excoriated by A.E. Housman as a “longer and nobler-sounding name for ‘fudge’”). Despite these efforts their labors did not produce an exact science, as Housman’s lampoon testifies. But the cultural milieu of the 19th century, which exalted science, technology, and progress, and made a religion of the elimination of pseudo-fathers and the discovery of “origins” (as in the writings of Darwin, Marx, and Freud), promoted the belief that such a science was possible and indeed only a matter of time.

The quest for origins motivated not only textual criticism but also its companion “science,” source study (*Quellenforschung*), and it was to source study that some of the most talented scholars of the 19th and early 20th centuries turned—John L. Lowes, George Kittredge, Howard R. Patch, and many others too numerous to name here. Editing and source studies dominated modern ME criticism from the early 19th century to at least the years just before World War II and continues to play a significant role in the field. But already, even in the 19th century, countercurrents were stirring, especially in Germany, and these countercurrents began to find expression in literary criticism from the mid-20th-century until today.

Put most simply, even in the 19th century many doubted that criticism could be a “science” in any strict sense—*Geisteswissenschaften* (the humanities), although they are *Wissenschaften* or “sciences,” are nonetheless not *Naturwissenschaften*, the physical sciences. Those who entertained such doubts found their early and arguably still most articulate spokesmen in the phenomenologists and their immediate forerunners—Dilthey, Husserl, and Husserl’s student Heidegger. These philosophers first gave intelligent and intelligible voice to the doubts that criticism could be a “science.” In particular Heidegger’s demonstration, following Dilthey, of the “hermeneutic circle,” coupled with his critique of Cartesianism, in *Sein und Zeit* (*Being and Time*), provided critics with a philosophical understanding of criticisms inevitable implication in the deepest of all epistemological problems, the interference of the knower with the thing known.

At roughly the same time, in both America and Britain, practicing critics and poets, such as William Empson, John Crowe Ransom, and I.A. Richards, were arriving through practice at similar insights. These insights led to the New Criticism (see the preceding section on criticism of OE literature), arguably the most important and enduring movement in criticism in the 20th century. New Critical readers of ME literature after World War II included some of the brightest academic minds of the time—for instance, Charles Muscatine, E.T. Donaldson, and (a younger member of the group) Donald R. Howard. New Criticism did not repudiate philology or the findings of history,

but neither did it seek their immutable and reproducible “scientific” truths. Focusing on the formal properties of poetry, its practitioners sought instead to read ME literature—especially Chaucer but in Donaldson’s case also Langland—at levels of the original language that would be available to educated but nonspecialist readers, an agenda with clear if at the time largely unstated political motives and implications.

Unlike the New Critics the professing Christian medievalists of the mid-20th century, most notably C.S. Lewis, did seek a kind of immutable truth in poetry, with the crucial exception that these medievalists perceived ME literature as a vehicle of theological and dogmatic truth, not of “scientific” truth. Lewis and others like him (e.g., J.A.W. Bennett) used philology, textual criticism, history, and other methods to assert finally the Christian significance of ME literature. On the Cartesian graph they replaced certitude with faith.

Superficially similar to these critics are D.W. Robertson, Jr., and his followers in exegetics. Robertsons religious ideology led him to find Christian truth everywhere in ME literature, but at the same time he claimed that the discovery was the result of his “historical” method, which consists primarily in the use of biblical commentary as a source of explanatory information for ME literature. Many used such commentary and other contemporary medieval sources to explain ME literature—for instance, Judson Allen, R.E. Kaske, and V.A. Kolve—but without the relentless quest for the single truth that marks Robertsons brand of exegetics. For Robertson, in effect, his method was equivalent to “science”; and if his arguments are today condemned as “totalizing” (a common charge by cultural materialists, Marxists, and feminists), this charge in effect recognizes the pressure of the quest for certitude on critical method.

The present critical scene continues to be occupied by the fundamental Cartesian opposition between certainty and doubt. New movements still struggle around and between these poles—for example, New Historicism, represented at this moment by the work of Lee Patterson, who would ground historical criticism’s “final support within experience” (1987: 48), a repetition of the Cartesian flight from the *res extensa*, or external world, into the “certitude” of the self.

Other scholars, as of this writing, are approaching ME literature through psychoanalysis (both Freudian and Lacanian), Bakhtin’s notion of carnival and dialogism, feminist critiques of the politics of gender, gay studies, folklore, semiotics, anthropology, narratology, and so forth. The pluralizing of methods and approaches we have seen in the late 1980s and early 1990s may or may not promote liberation from the “oppositional thinking” of Cartesianism in criticism of ME literature, but arguably it will tend to relax the grip of positivism and the model of science on the arbitration of what is possible in

criticism.

In such an event criticism of ME literature may begin to explore alternatives to the binaries certitude/doubt or experience/language and seek genuinely new modes of discourse. Feminist criticism, for example, in studying the body of woman and the inscription of literature may reorient attitudes toward the spirit/letter dichotomy ubiquitous in ME literature. Or again psychoanalytic criticism, especially that influenced by Lacan, may contribute new explanations of the fascination with body parts in late ME literature (Langland's "lyme" [penis] or the slit throat of the *Prioress's Tale* or the diseased skin of Henryson's *Cresseid*).

Semiotics will probably reopen the question and problem of formalism to important new scrutiny, especially in connection with revolutionary developments in computer technology (which often transpire seemingly overnight), since electronic texts make possible faster, fuller, and more accurate searches of verbal patterns that contribute to semiosis in a given text; formal analysis supported by computer technology enables new comprehension of the "subjective" element in literary interpretation, for example—showing how, say, a particular syllable "stains" a writer's work like a kind of signature. Or gender studies, by demonstrating the ways in which gender identities are "constructions" of culture with political agendas, can be expected to support refinements of deconstruction's strategy of "taking the constructions out of" cultural formations so as to examine them in terms of their complex motivations.

Work involving anthropological approaches to literature, especially folklore studies, will continue to offer fresh, often radically differing perspectives on traditional problems of literary interpretation. Analyses inspired by Bakhtin and his notion of dialogism will likely multiply in the next several years, especially in the study of Chaucer, since Chaucer's works have proven particularly receptive to categories of interpretation deriving from Bakhtinian terminology.

What seems obvious at this writing is that there is an undeniable restlessness about modern criticism of ME literature that will agitate all students for some time to come.

Cuerden Psalter

The Cuerden Psalter (New York, Pierpont Morgan Library M.756) is the most lavishly illuminated of a group of manuscripts comprising mostly Bibles and psalters (there is one book of hours). The psalter has decoration in the form of roundels for the labors of the months and the signs of the zodiac (fols. 1–6) followed by seven full-page miniatures (each divided into six compartments) comprising a New Testament cycle and depictions of various saints, some of whom defy precise identification, such as the saint who stands in a box on legs (possibly St. Rumwold). All seven miniatures are set against plain gold or colored grounds enclosed within simple architectural devices that aid in compartmentalizing the subject matter. An eighth full-page miniature on a diapered ground (fol. 10v), depicting the *Virgo lactans* with male and female donor kneeling at her feet, completes the prefatory cycle. In this representation the Virgin is unusually shown crowned as Queen of Heaven. Its devotional content is clear from the placement of the image facing the opening of the psalter text.

Fig. 51. Cuerden Psalter (The Pierpont Morgan Library, New York. M.756), fol. 11. Psalm 1: David harping, the Judgment of Solomon, and two seated kings writing. Reproduced by permission of the Pierpont Morgan Library, New York.

The text itself has a ten-part division, with initials occupying eight lines

(half a text page) for Psalms 1 ([fig. 51](#)) and 109, three for Psalms 51 and 101, four for Psalms 52 and 97, and six for Psalms 26, 38, 68, and 80. All except Psalm 1, which has decoration in all the margins, have partial borders. This psalter is unusually elaborate in that every psalm and canticle (as well as the initials accompanying the litany), in addition to those already mentioned, receives decoration in the form of a three-line historiated initial, a rare feature in Gothic psalters predating those of the Bohun group, which adopt this practice. Also innovative for the date is the iconography of these psalm initials, which, like those of the major divisions, are in many cases a literal translation of some idea contained in the first few verses of the psalm, a feature pointing to influence from France.

The style of the Cuerden illuminator is distinctive. The pigments are flat and shadowless (except in more monumental figures, such as the Virgin); pink and blue dominate the picture space, and these colors are carried through to the draperies. A coloristic hallmark of this artist—evident in the shading of the arches within the composite miniatures—is a mottled green, frosted with white. Prolongations, composed of both rigid and organic elements, project from the initials, some of which terminate in diagonal stems in the lower margin while others divide at a point approximately midway down the shaft and sprout horizontal elements. The *Beatus* folio, where a variety of hybrid (half-human, half-animal) forms disport themselves on these platforms, is an effective illustration of this type of decoration. The figures are markedly static, the bodies being limited to a few simple gestures; the standing figures are either upright or very slightly S-shaped, while the drapery falls vertically in linear folds or is gathered up under the arm in two or three softly painted triangular folds, a feature that also suggests French influence. The naive-looking faces are delineated skillfully with a black pen-line and remain white except for a pale-red blush mark.

The psalter was illuminated by a hand very close to that in a book of hours (BL Egerton 1151) and in the Bible of William of Devon (BL Royal 1.D.i), which gives the name to this group, the sources of which are French. Branner has shown that there are close correspondences between the style of the William of Devon painter and that of the Parisian atelier of Johannes Grusch, similarities that are especially well supported by a musical manuscript now in Florence (Biblioteca Medicea-Laurenziana Plut. 29.1). Bennett, who has added further manuscripts to the William of Devon group, in the case of the Bibles has elucidated the Parisian origin of both text and iconography.

There is a case for postulating some English influence on the group in the area of border decoration. This shows analogies with the manuscripts centered on the Salvin Hours (BL Add. 48985), the ultimate origins of which lie in the William de Brailes workshop of ca. 1230–60, both groups suggestive of an

Oxford provenance. These stylistic correspondences are reinforced by the likelihood that Oxford was the center of production for the William of Devon group of manuscripts. Liturgical evidence points to a south Midlands destination for the Cuerden Psalter, since it has references to St. Fremund of Dunstable, St. Edburga of Bicester, and possibly St. Rumwold of Buckingham.

The psalter must be dated after 1262, as the Feast of St. Richard of Chichester, who was canonized in that year, appears in the calendar in the original hand. There is no internal evidence for dating the other manuscripts of the group. The Cuerden Psalter was probably produced late in the sequence of the extant works in which this illuminator can be identified, thus dating it to around 1270.

Cursor Mundi

A lengthy ME biblical history of the world (ca. 1300), mainly in octosyllabic couplets. The Latin title occurs in the opening rubric of several manuscripts and translates the prologue’s suggestion, “Cursur o world man aght it call, / For almast it ouer-rennes all” (267–68), “all” meaning biblical history from Creation to Doomsday.

About the author we can only make deductions from his composition. A

careful study of his poem and its numerous Latin, Old French, and ME sources reveals an accurate translator, a selective borrower, someone broadly read, a competent versifier, and a writer mindful of simplification for his lay audience. The original manuscript has not survived, but the language of the oldest extant copies points to a northerner writing around 1300. The leisure (the shortest version is 24,000 lines long), extensive library (over a dozen sources have been identified), and intellectual climate essential to such an undertaking suggest his membership in a religious community.

The poem survives wholly or partially in nine manuscripts and in three different forms, none of which exactly fulfills the prologue's promise (131–222) of a chronological history of man—divided into seven ages—as well as the sorrows of Mary and the festival of her conception. The Edinburgh version alone might have had this form, but its fragmentary state (lines 18,989–24,968) precludes certainty in the matter. The second form, found in the three northern and oldest texts (the Cotton, Fairfax, and Gottingen manuscripts), adds seven works of devotion, exposition, and prayer in various combinations, sequences, and verse forms to swell the poem to over 30,000 lines. The third and shortest form occurs in the later, southern texts (the Arundel, Trinity, Laud, and BL Additional manuscripts) and ends with the seventh age, Doomsday, thereby contradicting the statement of an intention (217–20) to include Mary's sorrows and the festival of her conception. Despite these difficulties scholars agree on the poem's northern provenance and subsequent extensive southern revision (possibly late in the 14th century). Precisely how this textual transmission occurred, however, is unclear and seems likely to remain so.

The poem's popularity, by contrast, is readily explained. In the prologue the poet cites stories of such well-known figures as Alexander the Great, Julius Caesar, Brutus, King Arthur, Gawain, Charlemagne, and Tristan and Isolde, tales that are, however, “bot fantum o pis warld (91) is warld” (91). Although he justifies his own work on the higher moral grounds of providing biblical history in English for his unlearned countrymen, his choice of matter and narrative manner clearly indicates his concern to entertain as well. Thus he provides standard biblical highlights, such as the Creation and Fall, Noah's Flood, the Babylonian captivity, Red Sea passage, birth and death of Christ, and so on. But he also incorporates the lively debate of the Four Daughters of God (Mercy, Truth, Justice, and Peace—familiar to readers of *Piers Plowman*), an allegorical description of the Castle of Love, a moving depiction of the human anguish of the childless Joachim and Anna before Mary's conception, Mary's exemplary adolescence as a temple virgin, the aged widower Joseph's almost comic reluctance to take her as his ward and wife, and a host of other highly readable, if apocryphal, stories. These include the wonder deeds of Christ's childhood (e.g., carrying a ball of water; sowing a grain of wheat that

yields a hundredfold return the same day; stretching an inaccurately cut wooden beam; and clapping his hands to bring clay pigeons to life). Similarly noncanonical and absorbing are the villainous Herod's grisly bodily afflictions and gruesome death in boiling pitch. Much of this nonscriptural matter originated in early theological polemics concerning such controversial issues as Mary's permanent virginity and Christ's dual human/divine nature. In the poem, however, this material is presented as fascinating narrative, unencumbered by obtrusive moralizing or learned commentary.

Where explanation is necessary, clarity and simplicity prevail, in keeping with the work's popular character. Hence the theological paradox of Mary's virginal conception of Christ is reduced to the simple analogy of light passing through glass; the parable of salvation (presented through the Four Daughters of God debate) employs the familiar background of law courts; and the discussion of Mary's fitness as Christ's dwelling place (the Castle of Love) makes practical use of a commonplace medieval building. Although these ideas and stories certainly did not originate with the poet, he clearly recognized their instructional value, and he gave them the kind of engaging treatment that helped establish their enduring vogue in the Middle Ages. Herein lies the poem's worth, as a storehouse of entertaining and edifying popularized material that rapidly found lasting expression in other art forms, such as drama, painting, sculpture, and stained glass.

The poem is also impressive for the variety, number, and handling of its sources, which include the Vulgate, Honorius Augustodunensis's *Elucidarium*, Herman de Valenciennes's Old French *Bible*, Comestor's *Historia scholastica*, Grosseteste's *Chateau d'amour*, Wace's *Etablissement de la Fête de la Conception*, the *Legenda aurea*, the *Gospel of Nicodemus*, *The Southern Assumption*, the *De nativitate Mariae*, the *Pseudo-Gospel of Matthew*, and the *Protevangelium of James*. The list may well be much longer, since it is often impossible to determine precise literary debts when hunting sources for widely available information. The handling of borrowed material likewise varies greatly, from careful extensive translation, to summary, to paraphrase, to continuous use of one source, to frequent change, according as the source and its style answered the poet's own notions of clear readable narrative.

Customs Accounts

Kings collected money from trade through tolls and market dues from an early date, and Richard and John experimented with taxes on overseas trade. The permanent, nationwide collection of duties on such trade began in 1275. Then a wool tax was set up by Edward I with the advice of the Riccardi, a Luchese merchant company, in order to secure the loans they made him. All merchants, English and alien, were to pay 6s. 8d. for each sack of wool or 300 woolfells, or 200 hides exported overseas.

Since this brought the king an immediate extra £8,000 a year in revenue, it is not surprising that the duties were extended. Heavy wool subsidies were introduced. Then from 1303 alien merchants paid a further 3s. 4d for wool, fells, and hides exported, and 2s. a tun for wine imported, 1s. a cloth imported or exported, and 3d. in the pound value for all other goods imported or exported.

In 1347 duties were imposed on cloth exports at the rate of 1s. 2d. a cloth of assize (ca. 24 yards long, 2 yards wide) for English merchants, and 1s. 9d. for aliens. Better-quality cloths paid higher duties. All overseas trade was finally

brought into the system with the imposition of tunnage and poundage dues, made permanent from Richard II's reign. All merchants, English and alien, paid 2s. (later 3s.) on a tun of wine, and 6d. (later 1s.) in the pound on the value of all other goods except wool, fells, hides, and, later, denizen cloth (cloth made by foreigners living in England under a special license of the king).

Duties now covered the trade of all merchants with all overseas areas, including the English dominions of Ireland, the Channel Islands, and Gascony. They did not cover coasting trade to other English ports. The duties differentiated between aliens and Englishmen; actually there were three categories of payments, since Hanseatic merchants claimed that their charter of privileges exempted them from all duties imposed after 1303. Their claim was usually accepted by the English kings, to the resentment of English merchants. Thus, for example, English merchants paid 1s. 2d. on cloth (the duty of 1347), the Hansards paid only 1s. (the duty of 1303), and other aliens paid 2s. 9d. (the duties of 1303 and 1347 together); the Hansards also refused to pay tunnage and poundage.

National duties were collected at thirteen (later fifteen) headports between Newcastle and Bristol to which merchants would bring their goods for customs clearance, but collectors might open other outports for merchants' convenience. Wales and Cheshire fell outside the system, but their ports paid local duties to the crown as landlord. When the system was fully developed, two collectors in each port kept a roll of duties paid, a controller kept a separate counter-roll to act as a check, a searcher was appointed to prevent smuggling, and supervisors of search provided further checks. The customs revenue regularly provided one-third to one-half of the royal revenue, and care was taken to see that duty was paid. There were intermittent inquiries into smuggling and corruption, high rewards for informers, and sporadic efforts to punish offenders.

The system has left various records, of which two sets are particularly useful to historians. The particular accounts are the detailed records sent from individual ports to the exchequer at the end of the year or the collectors' term of office. They list the ships in and out, with their masters, shippers, and amounts and values of cargoes. The Bristol accounts also regularly give destinations. Their survival is patchy but they are extremely valuable sources for detailed patterns of trade and for local history.

The enrolled accounts contain the final totals accepted by the royal auditors after checking the particulars. They have far fewer details but indicate the overall scale and trends of trade for all England. They survive in an almost unbroken series from 1275 to 1547, when the system changed. The reliability of the records has been questioned, but E.M. Carus-Wilson provided a good defense of their use, provided caution is exercised. Ancillary documents

include the collectors' expenses, certificates of aliens' nationalities, and dockets proving payment of duty. The accounts of wine duties paid at Bordeaux also survive in some numbers for the period 1303 to 1453, when Bordeaux was lost by the English.

Local custom duties were also charged in many ports. The accounts are more difficult to use, since duties were not uniformly charged, but they did cover the coasting trade. Local accounts survive less well, but some exist for Bristol, Chester, Exeter, Great Yarmouth, Sandwich, Southampton, and Win-chelsea.

Cuthbert (ca. 635–687)

Anglo-Saxon monk and bishop. In 651 he joined the monastic community at Melrose in Scotland. Subsequently he accompanied Eata when the latter set up a monastery on estates given him by Alhfrith at Ripon, becoming guestmaster at the new foundation. When Wilfrid became bishop of Ripon, sometime before 664, Cuthbert returned to Melrose, becoming prior after the death of Boisil. Later he moved to Lindisfarne, where he was again prior, under Eata, now either abbot or bishop. In ca. 676 he retired to the island of Inner Farne to live the life of a hermit.

In 685, however, he was appointed bishop of Hexham, and although he was able to exchange sees with Eata, by now bishop of Lindisfarne, he had to leave his island retreat. He returned there late in 686 or early in 687 and died on 20 March 687. He was buried at Lindisfarne, where a cult quickly developed.

In 698 his tomb was opened and his body was found to be incorrupt; it was then translated to a new shrine. During the period of the Viking invasions his body was moved for safety, possibly to Norham on Tweed by Bishop Ecgréd (830–45), to the district of Carlisle in 875, and to Chester-le-Street in 883. Finally it was transferred to Durham in 995, where it remains and where many of the saint's relics, including his coffin and pectoral cross, are preserved. The Lindisfarne Gospels, which were made for the saint's shrine, probably in association with the translation of 698, are preserved in the British Library.

Cuthbert is important as a major ascetic and a bishop. Although he was an Englishman, his style of life seems to have looked back to that of Aidan and of the Irish community on Iona. He is depicted as a saint in this mold in the anonymous *Vita Cuthberti* written ca. 698. Bede wrote a verse *Life of Cuthbert* ca. 705 (perhaps revised ca. 720), a second prose life in ca. 720, and a final version in the *Ecclesiastical History*. These last two works depict Cuthbert as an ascetic within the model envisaged by Gregory the Great. In all probability this shift in interpretation marks a response to the *Vita Wilfridi*, composed by Stephanus shortly after 709. Certainly part of the inspiration for the promulgation of the cult of St. Cuthbert seems to have been rivalry with Wilfrid's foundations of Ripon and Hexham and with Wilfrid's episcopal style.

Cynewulf (fl. early 9th-late 10th century?)

One of the two named Anglo-Saxon poets (the other is Cædmon). His identity is unknown, although he wove his name into the epilogues of four poems; his dates are undetermined, although he probably did not write before 750 nor after the late 10th century; his provenance is uncertain, although dialect features of his poems indicate that he was either Mercian or Northumbrian; and his corpus has been limited in the last half-century to the four poems that bear his signature and appear in the Exeter Book (*Christ II*, *Juliana*) and the Vercelli Book (*The Fates of the Apostles*, *Elene*).

Identity and Language

Cynewulf uses runic letters to incorporate his name into his poems, spelling it CYNWULF in *The Fates of the Apostles* and *Christ II*, CYNEWULF in *Juliana* and *Elene*, and making it an integral part of his message as he asks for his audience's prayers. In three epilogues he exploits the fact that runes stand both for letters and for things or concepts such as "need" (the N rune is named *nyd*, "need, necessity") and "joy" (the W rune stands for *wynn*, "joy"). Only in *Juliana*, where he groups the letters CYN, EWU, and LF, does Cynewulf seem to use runes solely as letters. Scholars are uncertain about how to interpret the signatures just as they are about how to assess their historical significance. It has been argued that Cynewulf's signing his work merely conforms with an ancient Germanic practice of signing art objects in runes, that it reflects a vogue among contemporary Latin writers for using acrostics, and that it may signal a shift in Anglo-Saxon society from orality to literacy. It may also indicate a move away from the traditional view of both poet and poetry as communal and therefore necessarily anonymous.

Scholars in the 19th and early 20th centuries favored four candidates for being the poet: Cynewulf, bishop of Lindisfarne in Northumbria (d. ca. 783);

Cynulf, a priest of Dunwich in East Anglia (fl. 803); Cynewulf, the father of Bishop Cyneweard of Wells in Wessex (d. ca. 975); and Cenwulf or Kenulf, abbot of Peterborough in Mercia (d. 1006). Historical and linguistic evidence is far too meager to support any of these identifications. Furthermore nonliterary sources make clear that a large number of ecclesiastics named Cynewulf and theoretically capable of writing poetry lived during the period when the poet may have flourished. His identity remains a mystery.

Lacking historical data, scholars depend primarily on Cynewulf's name for determining when he may have lived. The form "Cynewulf" derives from an earlier form, "Cyniwulf." The spelling change from -i- to -e- reflects a sound change that took place because of the weak stress on the syllable in which the vowel appears, and philologists have shown that that change could have occurred as early as 750. Scholars have also found that the particular order of apostles in *The Fates of the Apostles* does not appear in comparable texts until after the early 9th century. Cynewulf was thought most probably active, therefore, around the late 8th and early 9th centuries. Recent research on a later source for *The Fates of the Apostles*, however, strongly supports the possibility that he flourished between the late 9th century and the late 10th, when the Exeter and Vercelli books were composed.

Scholars know that Cynewulf wrote in the Anglian dialect, although they still dispute whether it was Northumbrian or Mercian within that broad category. The scribes of the Exeter and Vercelli books both wrote in West Saxon, and the two imperfect leonine (internal) rhymes in *Christ II* and the four in the epilogue to *Elene* can be corrected by translating those rhymes into Anglian. Compare, for example, West Saxon *hienpu* / *mærpu* of *Christ II*, line 591, with Anglian *hænpu* / *marpu*, or West Saxon *riht* / *gepeaht* of *Elene*, line 1240, with Anglian *reht* / *gepeht*.

Works

When Cynewulf was first discovered in 1840, one editor attributed all poems in the Exeter and Vercelli books to him. Other scholars subsequently asserted that Cynewulf wrote every OE poem that Cædmon did not and was perhaps even the final redactor of *Beowulf*. Later 19th-century scholars argued more conservatively, eventually claiming that in addition to his four signed poems Cynewulf wrote just eight others that resemble them in subject matter or style: *Guthlac A*, *Guthlac B*, *Christ I*, *Christ III*, *Physiologus* (or *The Panther*, *The Whale*, and *The Partridge*), and *The Phoenix* from the Exeter Book; *Andreas* and *The Dream of the Rood* from the Vercelli Book. These twelve poems

constitute “the Cynewulf Group.” Largely because of studies by Das, Schaar, and Diamond in the 1940s and 1950s, however, scholars now recognize only the four signed poems as Cynewulf’s own. The question of the order in which Cynewulf composed his poems remains vexed, but most scholars currently feel that he wrote *Elene* last.

The Fates of the Apostles, a 122-line poem, follows *Andreas* in the Vercelli Book and was therefore once counted part of that poem; it is perhaps the least appreciated of Cynewulf’s works. Deriving from the martyrology with no single Latin source and classified primarily as a catalogue poem, it offers the barest detail about the missions and deaths of the twelve apostles. It consequently has been placed either first or last in Cynewulf’s canon, the product of a clumsy novice or a feeble old man. Recent critics have treated the poem more sympathetically, arguing, for example, for a sophisticated numerical structure or for Cynewulf’s establishing an implicit comparison between himself and the apostles, between their work and his, while simultaneously creating an ironic distance between himself as a fallible human being and them as transcendent followers of Christ. Notable in this poem is the unique arrangement of Cynewulf’s signature: F, W, U, L, C, Y, N. The letters’ dislocation and placement of the last first may reflect both the poet’s sense of personal dislocation at being a sinner and personal joy in the biblical promise that the last shall be first.

Cynewulf’s 426-line, meditative poem about Christ’s Ascension into heaven is known as *Christ II* or *The Ascension*. It is the second of three poems in the Exeter Book about Christ. The poem’s source is the final three sections of Gregory the Great’s 29th homily on the Gospels, in which Gregory asks why angels did not wear white robes at the Incarnation while they did at the Ascension. Cynewulf draws mainly on that homily but mines passages of scripture as well, including the 23rd Psalm, and seems indebted to Bede’s hymn on the Ascension, some patristic texts, and iconographic items. In the course of this loosely structured, reiterative poem Cynewulf describes the Ascension and human beings’ and angels’ reaction to it; admonishes his audience to be grateful for all God’s gifts, especially salvation granted to humankind through the Ascension; likens Christ’s mission on earth to the flight of a bird; praises Christ for his dignifying both angels and humankind by his actions and for granting intellectual gifts to men; thanks Christ for his six “leaps” (the Incarnation, Nativity, Crucifixion, Burial, Descent into Hell, and Ascension); encourages his audience to prepare for the Last Judgment; and concludes with a conventional but extended simile comparing human life to a sea voyage. Whereas Gregory answers the question about the angels’ white robes directly, Cynewulf does not. They were appropriate at the Ascension, he implies, because Christ, angels, and human beings are all exalted through

Christ's gifts and leaps.

Juliana, a 731-line poem about the early-4th-century St. Juliana of Nicomedia, vies with *The Fates of the Apostles* for being deemed Cynewulf's worst—and therefore either his first or last—work. Whatever early scholars' estimation of its quality, the poem has the distinction of being the earliest extant vernacular version of this saint's life, and recent studies show that it does have artistic merit. Cynewulf's source for the poem is probably a Latin prose life close to one contained in the *Acta sanctorum* for 16 February, in which is told the simple story of Juliana, daughter of the pagan Africanus, who promises her in marriage to the pagan prefect Heliseus. She refuses to marry Heliseus unless he converts to Christianity. He refuses, and she is imprisoned, tortured, tempted at length by a demon, and ultimately beheaded. Cynewulf polarizes the saint and her persecutors much more emphatically than does his source, and he amplifies dialogue considerably to emphasize Juliana's verbal power and spiritual resilience. Cynewulf's dislocated signature (CYN, EWU, LF), like that in *The Fates of the Apostles*, probably reflects the dislocation he feels, this time at the separation his soul must experience from his body in death.

Elene, Cynewulf's 1321-line poem about the discovery of the Cross by St. Helena, mother of Constantine, is uniformly considered his best. Its source probably closely resembles the *Acta Cyriaci* (*Acta sanctorum*, 4 May). After defeating the Goths by the sign of the Cross, which was revealed to him in a dream, Constantine is converted to Christianity and sends his mother to Jerusalem to locate the actual Cross. Elene confronts the Jews about its location through their chosen representative, Judas, who refuses to help her and whom she confines to a pit without food. Judas quickly relents and is himself converted. His prayer brings a sign indicating where the Cross lies buried, and a church, by order of Constantine, is later erected there. After being baptized, Judas becomes Cyriacus, bishop of Jerusalem, and prays for another sign to show where the nails of the Cross might be. He receives that sign, and the nails are made into a bit for Constantine's horse. The poem ends with Cynewulf's signature and a passage on the Last Judgment. The poet's major themes concern revelation and conversion (of Constantine, Judas, and Cynewulf), and he skillfully manipulates style and structure to develop those themes. The speeches in the narrative—considerable elaborations, as in *Juliana*, of their Latin source—play a crucial role in Cynewulf's affirming the Cross's transforming power.

Dance, Dance Music

Little is known of the dancing habits of the people who inhabited the British Isles in the second half of the first millennium A.D. Some association with the seasons in many of the earliest English texts in dance meters implies that danced rituals connected with fertility and the agricultural cycle were already long in use. Bede condemned enjoyment of the erotic arts of young professional dancing girls; on the Continent there are several burials of such performers along with their personal soundmakers. In the 12th century William Fitzstephens description of young girls' sung dances during Easter festivities in London, though taken directly from the *Odes* of Horace, was no doubt still applicable. A 13th-century French poem on the walling of New Ross (an Anglo-Norman town in southeast Ireland) described outdoor craft processions to pipe-and-tabor music, young people's processional karoles, and wealthy ladies' songs and recreational karoles. In the Red Book of Ossory, made in the 60-miles-distant city of Kilkenny, there are 14th-century Latin texts, in several dance meters, for some of these types. They include many examples of *rondeau*, a recurrence pattern not found in contemporary English karole texts.

Of figured dances for pairs the *estampie* seems not to have become acculturated in England. The few known notations have French associations: two polyphonically set estampies are found in the Robertsbridge Codex, and a fragment notated in Ireland in the 18th century was associated with the Hiberno-Norman Burke (de Burgh) family. Two 13th-century polyphonic notations appear to conform to the loose definition of *stantipes* given by the late-13th-century theorist Johannes de Grocheio; one has three sections (*puncta*), the routine being repeated making six in all, and the other has seven, the last two being repetitions of the first two. Johannes approved the difficulty of execution as a deterrent to dalliance between partners. Such strictures did not operate at high social levels. After dinner at the tournament held at Windsor by Edward III in 1343 there were dances with formal embracings and kissings. There were many more men than women in great households, and

women's dances (probably karoles) took place in the ladies' private chambers.

Fourteenth-century depictions of social dance are almost entirely of karole, in both linear and circular shapes, with all male, all female, or mixed participants. Many are in illustration of moralities or scenes from the Bible or romantic tales, but they are accurate on the whole, even to the open mouths of the executants in some cases. There are also some depictions of professional performers. These include acrobatic dancers, often women accompanied by a loud instrument, and the original moresque, a single dark or darkened male performer, dancing frenetically to a percussion instrument.

There is no written record of Burgundian basse-danse or the new Italian dances of the later 15th century being performed in England. But after-dinner dances, known to have been performed on occasions like the visit of Louis de Gruuthuyse, Graaf van Holland, to Edward IV at Windsor in 1472, were no doubt both fashionable and known to all parties. In the early 16th century the dancings and disguisings traditional on St. Nicholas's Day, during the Christmas period and at pre-Lent Carnival and Midsummer, were elaborated into masques after the Italian fashion.

Daniel

An OE narrative poem based loosely on the first five chapters of the Old Testament book of Daniel. Like most OE poetry *Daniel* is anonymous and undatable. At one time the poem was thought to be the work of Cædmon, but this theory has long since been disproved. Nevertheless, the manuscript in which it is found—Junius 11—is still known as the Cædmon Manuscript. *Daniel*, the third of four poems in this manuscript, is found on pages 173–212. As it stands, the poem is some 764 lines long, though such prominent critics as Israel Gollancz, Neil Ker, and Peter Lucas have viewed it as incomplete, believing that a missing leaf may have held its ending. The text itself, however, finishes at the bottom of a page, where a simple point marks what is apparently a complete sentence.

Daniel contains little of the apocalyptic and prophetic material found in the later chapters of its source. As Robert Farrell notes, “The author of the OE *Daniel* is clearly interested in the narrative portions [of the source], especially those dealing with Daniel and the Three Children in their struggles against Nabuchodonosor and his line” (1974: 30). This focus in turn bears upon another major critical debate surrounding the poem: whether or not lines 279–361, the poet’s version of the Song of Azarias and introduction to the Song of the Three Children, are an interpolation. Although many questions surround the inclusion of the Song of Azarias in *Daniel*, the central problem revolves around the fact that the two Songs repeat and, in some ways, diminish one another. The OE poet, however, may simply be following his source closely here.

The central characters in *Daniel* are Nabuchodonosor, his son Baltassar, and the prophet Daniel himself. Daniel serves an important religious function in the poem (this can especially be seen if he is compared with other saintly protagonists in OE poetry, such as Elene, Andreas, and Judith). However, it is clear from his relationship with the two kings that his role is also a political one, for he is cast in the part of court counselor and adviser. Indeed it is his skill as a prophet and adviser that gains him widespread fame at the court

(lines 163–67).

Throughout the poem Daniel's skill and intelligence are highlighted, and the poet makes clear that Nabuchodonosor desires to acquire the prophet's wisdom and not, as the Vulgate source indicates, to educate him in the ways of the Chaldeans. This is just one example of the ways in which the OE *Daniel* departs from its source and helps to illustrate the fact that the poem is far from a slavish paraphrase of the Vulgate book, a view that has been held by the majority of critics for some time. Further differences, in characterization and theme, help to attest further to the originality of the Anglo-Saxon poet.

The language of the poem is predominantly West Saxon with a few examples of other dialect forms. The poem is also noted for having an unusually high percentage of hypermetric, or "long," lines.

Death and Life

A dream debate poem written in 458 alliterative long lines and exceptional for its command of the allegorical conventions of vision verse and for the dramatic vigor of its personified combatants, Dame Death and Lady Life. Although the date of the poem is uncertain, its assured style would seem to place it well within the mainstream of alliterative tradition late in the 14th century. The question of date remains open, however, for the poem’s sole copy survives in the 17th-century Percy Folio (BL Add. 27879). Its provenance appears to be

northern.

The poem allegorically enacts the theological doctrine of Life victorious at the Resurrection of Christ. The Crucifixion becomes a joust in which Death at first believes herself the winner but learns instead how she has foiled herself. Death's spear wound to Christ's side releases Life from her bower, Christ's heart, and, in a spirited retelling of the Harrowing of Hell, the two victors—Christ and Lady Life—joyously send Death to hell's hole, to abide with fiends, as they also release the Old Testament saints.

The poem opens with a narrator who finds himself enlivened by the surrounding landscape, a pleasant Maytime scene conventional in vision poems, and the poet emphasizes the narrator's personal sense of involvement with animated nature. Immediately after the spring opening the narrator dreams of Lady Life, who embodies all the formerly insensate attributes of the scenery—that is, the May scene come to life as a personification. These introductory poetic devices connect the narrator-as-everyman with the theme of Life victorious at Christ's death. The pattern of waking-sleeping-reawakening is like the pattern of human life, where living leads to dying, which leads to renewed, immortal life. The narrator's supine, deathlike dream state frees his visionary soul to experience symbolically the paradox of Christian faith, that immortal life is released only through death. Sleep “drove into his heart” (line 38) just as Death “carved through the heart” of Christ (line 347).

The prayers that frame the poem, at beginning and end, both invoke an image of the crucified Christ. The poem shows how this seeming symbol of death in fact promises life's absolute victory. This mystery informs the poem's structure (which seems modeled upon the Cross), imagery (Life's convex fullness versus Death's concave emptiness, reflected in holes filled and emptied, in bowing actions up and down, and in a landscape of hills and valleys), and linguistic sophistication (puns, alliterative sound play, flying epithets, and subtle modulations of tone of voice).

In subject matter the poem has often been compared with *Piers Plowman* B. 18 (on the Harrowing of Hell); it does not suffer from the comparison. In refashioning liturgical and scriptural elements into a poem of dramatic depth and human immediacy the poet shows himself an innovative artist of considerable power.

Debate Poems

The medieval genre of debate poetry is well represented in ME and includes several poems of literary distinction. Among the most notable are the ME bird debates *The Owl and the Nightingale* and *The Cuckoo and the Nightingale*, the body-and-soul debate *As I Lay on a Winters Night*, and the alliterative debates *Winner and Waster*, *The Parliament of the Three Ages*, and *Death and Life*. Considered collectively, ME debate poetry encompasses a wide variety of poems: serious didactic works, comic entertainments, satiric poems, courtly poems. Some of the ME debates have ties to the animal fable, some to medieval romance, and some to the fabliau; several ME debates are also dream visions. But despite the significant differences exhibited by the many poems belonging to the genre, central to each is a contention between emotionally aroused opponents who match wits in a series of verbal exchanges. The terms “contention poem” and “conflict dialogue” are quite apt for most of these works.

The Owl and the Nightingale is the earliest of the ME debates. It was written around 1200, shortly after debate poems first began to appear in the European vernacular literatures (Provençal and Old French in particular). Before the 12th century the debate poem had existed only in medieval Latin. The late-8th-

century Latin poem *Conflictus vens et hiemis*, attributed by some scholars to Alcuin, is considered the earliest true medieval debate poem. A dispute between the personified figures of Spring and Winter is overheard by shepherds, who at the conclusion of the debate offer a judgment in favor of Spring. Debates like this one between seasons of the year, body and soul, and water and wine were common in Latin poetry, and some of these same rivalries occur in ME. Most debates involved nonhuman participants, but there are also debates with human protagonists, such as those between occupational rivals (e.g., a sailor and a farmer) and those between human debaters with contrasting beliefs (e.g., a Christian and a Jew). Depending on the nature of their disputing parties, debate poems are classified as “horizontal” debates, poems in which the disputants enjoy fairly equal status, or as “vertical” debates, in which the debating parties exist on different levels of authority or abstraction. Most of the ME debates are horizontal, but there are a few exceptions, such as the poem *Child Jesus and the Masters of the Law of the Jews*, in which the mismatched nature of the participants becomes apparent as the divine child easily confounds the learned doctors.

There are several important subcategories within ME debate poetry, most notably bird, body-and-soul, and alliterative debates. The bird debates include *The Owl and the Nightingale*, *The Thrush and the Nightingale*, *The Cuckoo and the Nightingale*, and William Dunbar's *The Merle and the Nyghtingali*. Closely related to them are *The Clerk and the Nightingale I and II* and *A Parliament of Birds* (“In May when euery herte is ly3t”). Chaucer's *Parliament of Fowls* also bears some relation to this group. *The Owl and the Nightingale*, the first of the ME bird debates, is a sophisticated and challenging poem, commonly regarded as the greatest comic poem in English before Chaucer. The avian rivals in this poem, both of them female, are two of the most vividly drawn characters in ME literature. Their dispute touches upon a wide range of subjects and reflects the poet's familiarity with natural history, contemporary literature, and a great deal of popular lore. *The Owl and the Nightingale* is one of several ME debates in which the dispute is not finally resolved.

The Thrush and the Nightingale, which belongs to the second half of the 13th century, attempts and achieves much less than its predecessor. Here the debaters are of opposite sex and their debate focuses on the worth of women, with the male Thrush attacking women and the female Nightingale defending them. Although the Thrush appears to have the upper hand throughout most of the debate, the poem is resolved in the Nightingales favor when she presents the Virgin Mary as the saving grace of womankind. *The Cuckoo and the Nightingale* (also called *The Book of Cupid*) is a dream vision; it was probably written late in the 14th century by Sir John Clanvowe, one of Chaucer's friends, and is an important work of the Chaucer apocrypha. The poem

contains several allusions to Chaucer's work, and its wryly comic treatment of love is remarkably similar to the treatment love often receives in Chaucer's own poetry. *The Cuckoo and the Nightingale* is similar to *The Thrush and the Nighúngalem* that the female Nightingale's opponent is a male bird who sharply criticizes love and lovers, but in this poem the debate is not so clearly resolved in the Nightingale's favor.

Of the ME debates between the body and the soul *As I Lay on a Winters Night* is the most dramatic. Preserved in six manuscript texts, this popular work combines pathos and terror with verbal and situational humor. The winter's-night setting of the poem contrasts with the springtime setting found in the bird debates and some of the other ME debate poems. Although its didactic purpose is to demonstrate humanity's dire need for repentance before the arrival of death, the poem delves into the intricate relationship between body and soul, emphasizing their mutual dependence and identifying the physical and spiritual sins each may fall prey to. The poem concludes with a graphic depiction of the sinful and recalcitrant soul being dragged off to hell by demonic hellhounds, at which point the narrator awakens from his dream in a cold sweat. A late work in the ME body-and-soul tradition is the 15th-century *Disputation between the Body and the Worms*, a dream vision in which the body of a beautiful woman is confronted in the grave by a novel set of "suitors"—worms, maggots, toads, and the like. Here the thematic emphasis is on becoming reconciled to the physical realities of death rather than on becoming spiritually prepared for death.

The three alliterative debate poems in ME—*Winner and Waster*, *The Parliament of the Three Ages*, and *Death and Life*—are similar in length (about 450–675 lines) and structure, and each has an elaborate dream-vision framework surrounding a central debate between personified figures. *Winner and Waster*, composed probably during the 1350s or 1360s, is one of the most impressive satiric poems in ME. The author focuses on the nature of these opposing economic forces (i.e., saving vs. spending, avarice vs. prodigality) and on the social chaos that ensues when they are not held carefully in check. The speaker's disenchantment with contemporary social conditions is revealed through both overt and subtle satiric commentary. The final verses of the poem, unfortunately, are lacking from the only surviving manuscript, BL Add. 31042, one of the two ME "Thornton" manuscripts.

The Parliament of the Three Ages, probably written near the end of the 14th century, explores the spiritual dangers that stem from the pursuit of worldly pleasures and achievements. The poem also reflects the poet's familiarity with works of medieval romance and his detailed knowledge of such worldly pursuits as hunting and hawking. Especially remarkable is the lengthy opening passage detailing the activities of a solitary deer hunter. The overall design of

the *Parliament*, however, is flawed by the extreme length of the sermon by Elde (Old Age), which incorporates an extended description of the Nine Worthies (the great pagan, Jewish, and Christian heroes) into its discourse on the vanity of earthly things.

In *Death and Life* the poet seeks to assuage humanity's instinctive fear of death by asserting the supremacy of eternal life and the temporary nature of death. The poem contains several vivid descriptive passages and reflects the poet's fine sense of symmetrical design. Its date is uncertain, though probably late 14th to early 15th century. Its only extant text is in the 17th-century Percy Folio.

Several of the lesser ME debates should also be mentioned. The *Debate of the Carpenter's Tools*, in which 27 personified tools participate in a dispute about the carpenter's prospects for success, given his fondness for drink. It may be a minstrel's performance piece. It is also an excellent source of information about medieval carpentry and the implements of that trade. The debate *Meed and Much Thank* depicts a lively and provocative confrontation between a sycophantic courtier and a dedicated soldier and raises fundamental questions about human motivations. In the debate poem *Nurture and Kind* (i.e., Nurture and Nature) these personified figures are concerned with which of them has the greater influence on behavior. This poem focuses on the relative importance of training versus instinct and includes an amusing anecdote involving a cat that Nurture has trained to hold a candle. The ME pastourelles, dialogue poems in which young men (often knights or clerks) attempt to seduce young women (usually of rural or village origins), also deserve mention among the many and varied ME poems belonging to the debate genre.

Deor

A 42-line poem preserved in the Exeter Book, possessing an irregular stanzaic structure marked by manuscript spacing and small capitals. *Deor* exemplifies the close association of lyric and heroic in Anglo-Saxon verse and is notable as one of two extant OE poems with a refrain. The first five stanzas (27 lines) allude tantalizingly to specific examples of adversity drawn from heroic legend. The last stanza has a natural division at line 35. Departing from the pattern of presenting examples, the first half (lines 28–34) generalizes about adversity: a passive, hopeless response to adversity is contrasted with a response acknowledging that the wise Lord distributes portions of both good fortune and bad. The second half (35–42) introduces the lyric mode by shifting

from the third person to the first person and gives a final specific example purportedly drawn from the poet's own experience. Each of the six stanzas ends with the refrain, *Pas ofereode; pisses swa mag* ("That passed; this can/will also"), which, with the first half of the last stanza, provides the thematic core of the poem.

Kemp Malone and other scholars who have traced the stories called to mind by the allusive names and particular details in *Deor* fill in for modern readers valuable background material from Germanic legend and history. The first story is about Weland, a famous metalsmith taken prisoner by King Niðhad, hamstrung, and forced to work for the king. *Deor* names Weland and Niðhad and stresses Weland's physical and emotional suffering during his captivity. Legend tells us Weland finally escaped after avenging himself on Niðhad, by creating works of art from the bodies of his captors' sons and raping his daughter. The second story focuses on the ravished daughter, Beadohild, whose passivity in her adversity contrasts sharply with Weland's audacity. The refrain seems to point to the outcome of the legend (not articulated in *Deor*), that the son resulting from Beadohild's pregnancy brought a turn for the better in her fortunes.

The third story recounts the sleeplessness and lamentation that Mæðhild or Geat or both suffered as a result of *sorglufu* (sorrowful love). According to two parallel legends (which, except for the possible example of *Deor*, survive only in 19th-century recordings of Scandinavian ballad) Mæðhild responds passively to adversity, her foreknowledge that a water sprite will magically draw her to her death in a river, by weeping; Geat, her husband, responds actively and artistically, playing the harp so powerfully that his music draws his wife's body out of the river. According to one version the turn for the better signified by the refrain would be the restoration of Mæðhild to her husband; in the other version it would be his recovery of her body for burial and use of her hair to restring his harp.

The fourth story is recounted most briefly, in two lines (by modern lineation), merely stating that Deodric had control over many people for 30 winters, with the implication that even such a long period of tyranny eventually came to an end. In the last example from legend the men ruled by Eormanric, another tyrant, sorrowfully but hopelessly wish for his overthrow. These two examples place the active ruler against the passive victim, no longer exclusively female, thus extending the implications of the refrain to loss of good fortune for the tyrant as well as an eventual passing of bad fortune for the victims.

In line 35 the speaker adopts the lyric mode of the other Anglo-Saxon elegies, shifting from the third person to the first with the line *Pat ic bi me sylfum secgan wille* ("I want to say about myself that..."), transforming the

poem from an impersonal commentary on adversity into a highly personal lyric. Here the speaker relates having formerly been highly valued as a *scop*, a poet-musician, but then losing his place to Heorrenda (whose reputation as a great poet of legend overshadows the fame of the lords he served). The final section invites a reader to read the refrain as having a personal application not only for the speaker in the poem—just as adversity passed for Weland, Beadohild, and Mæðhild, so it will for Deor—but also as a lesson about the condition of transience in the world. Finally the success of the poem attests to the poet's having overcome adversity and achieved immortality through his art.

Deserted Villages

The reduction and movement of rural population caused a widespread abandonment of villages, starting in the second quarter of the 14th century. Desertions commonly occurred in areas of less productive soils or later medieval sheep rearing. Physical remains of deserted villages are often found in pastureland, occasionally in woodland or arable; many sites were damaged or destroyed by “emparking” and landscaping for manor houses.

The village was the standard form of social and economic rural organization for much of England. Its durability is due to a long period of development in which Anglo-Saxon settlements were rarely permanent. Before the 14th century specific reasons usually exist for village desertions, such as William I's New Forest depopulations.

The widespread partial or total abandonment of late-medieval villages, however, represents a major change. Explanations are varied; three interrelated factors have been viewed as contributing. 1) Demography: the Black Death initiated and maintained an overall population loss of at least one third. 2) Agriculture: changing farming practices saw the labor-intensive cultivation (grain production) of cooperative agricultural communities shift to sheep rearing (wool production) with a smaller work force. 3) Economics: an expanding money economy caused lords to lease lands for cash rents, thus breaking up manors, and to hire labor for wages, making the village community labor force obsolete. Recent evidence suggests another factor. 4) Ecology: villages established or expanded during the population peak of the 12th and 13th centuries were abandoned because only marginal land had been available to them and its cultivation failed after several generations of depletion in an increasingly unfavorable climate.

Deserted villages have served as symbols of better times in the past, offering an idealized view of medieval society: there had once been more people, in a “traditional society,” on the land. More recently, deserted villages have become an important asset for historical research, as archaeologists turn to the remains of peasant houses and lots for the unrecorded details of rural life. Results from the long-term multidisciplinary research program at Wharram Percy in Yorkshire have served to remind scholars of the prodigious power of the lord of the manor over the lives and fates of the tenants, as well as of the special permanence of the village church among less durable structures.

Dispenser Family

Led by Hugh senior and Hugh junior, they were from a modest baronial background but rose to prominence through Edward I's patronage. The elder Hugh (b. 1261) followed a conventional career of military expeditions, local office holding, and royal counsel. For his loyalty he was named earl of Winchester in 1322.

The ascent of the younger Hugh (b. ca. 1285) was more spectacular. His career as a royal servant was unremarkable until 1318, when he was appointed or reappointed royal chamberlain. He used that position to build a large following among household and local officials. He gained enormous influence over Edward and reaped rich rewards. The territorial base gained through marriage (to one of the three Clare heiresses) proved insufficient, and he embarked on a campaign of intimidation and harassment to enlarge his holdings.

Because of the Despensers' flouting of the law and their manipulation of Edward they were driven into exile in 1321. When they returned later that year, some nobles, the "Contrarians," rebelled. The revolt failed and the rebels forfeited their lands, many of which were given to the Despensers. Over the next four years they continued to monopolize royal favor, arousing nearly universal hatred. When Isabella invaded England in 1326 and overthrew Edward II, they were quickly captured and executed.

Dialogue of the Exchequer

A treatise, written between 1176 and 1179, as a practical introduction to the exchequer, the financial office of the English kings. The author, Richard Fitz Neal (or Nigel), was the son of Nigel, bishop of Ely, Henry Is treasurer. Richard himself was treasurer from ca. 1158 to 1196 (from 1189 to his death in 1198 he was also bishop of London).

The *Dialogue*, which bears a fulsome dedication to Henry II, was doubtless intended for apprentice exchequer clerks and is written as a conversation in simple Latin; a pupil asks questions and his master answers (a common form in textbooks of the period). The master explains that the exchequer derives its name from the checkered cloth, reminiscent of a chess board, on which counters are moved on the accounting table as on an abacus. The lower exchequer, also called the exchequer of receipt, is where money is counted and entered on rolls and tallies, and the upper exchequer is where the audit of the accounts takes place. The duties and wages of the officials of both lower and upper exchequer are detailed. The upper exchequer is the larger, and here the officers sit on four benches facing the four sides of the table. The justiciar presides, representing the king, but the treasurer is the chief official, responsible for both exchequers, and is compared by the master to the king in the game of chess.

In the battle of the exchequer, he says, the opposing chess kings place is taken by the sheriff. Each county has a sheriff, responsible for the king’s revenues in the shire and summoned to the exchequer twice a year. The account is made up on the Pipe Roll at Michaelmas, when the sheriff is examined by the treasurer, regarding his “farm” of the royal receipts (the stipulated money he owes from the county’s revenues), and then by the chancellor’s clerk regarding the profits of justice.

Dioceses and Diocesan Structure

The Christian church had been introduced into the Roman province of Britannia by the time of the martyrdom of St. Alban in 304, and the British church was represented by three bishops at the Council of Arles in 314. What area each bishop governed and in what way he governed are unknown. There may well have been some continuity, despite the pagan Saxon invasion, in western, Celtic Britain (Cornwall, Wales, and the northwest), where traditions of survival remain strong. However, only with the establishment of dioceses can an organized church be traced, beginning with the mission of Augustine to Kent in 597 and his appointment as archbishop of Canterbury in 601.

The gradual acceptance of the faith by Saxon kings led, after Æthelberht's original conversion, to the appointment of bishops at Rochester and London in 604, followed in the next 30 years by East Anglia and Dorchester. As the converted Saxons moved westward and northward, sees were founded at Worcester, Winchester, Hereford, and Lichfield. A second wave of missionary activity, from Ireland, spread into the north of England, establishing bishops at York in 626 and, in the next 50 years, at Lindisfarne, Hexham, and Ripon.

Shifting political boundaries, notably in the west of England, caused changes in the areas under the care of each bishop and alterations in titles as they moved their centers of operation (cathedrals; from Lat. *cathedra*: "throne"). From 630 East Anglia was ruled from Dunwich, for two centuries after 672 also by a second bishop from Elmham, then by one bishop based at Thetford, and only from ca. 1096 from the substantial commercial center at Norwich.

In the north the bishop of Lindisfarne was forced from his island by Viking raids and in 883 went to Chester-le-Street, changed in 995 for greater security to Durham. As the Saxon advance westward made the old see of Winchester unmanageable, a second see was founded at Sherborne ca. 705. Further

advance brought the division of both and the creation ca. 909 of Ramsbury out of Winchester, and Wells and Crediton out of Sherborne.

Changes of title also resulted, both before and after the Norman Conquest, from a policy of moving sees from small, ancient sites to larger towns; the bishop of Selsey to Chichester (1070), Wells to the intellectual center of Bath (1060), Dorchester to Lincoln (1067), Crediton to Exeter (1046). Thereafter only two new bishoprics were created in the Middle Ages: Ely in 1109, Carlisle in 1133.

The laws of several Saxon kings established the status of bishops and clergy, and the names of charter witnesses suggest that bishops governed their sees with the help of clerks living in their households (*familiae*). Before the Conquest some dioceses were divided into rural deaneries, and a dean presumably acted in some sense as the bishop's deputy, as the bishop's role as Father-in-God took on judicial as well as pastoral and spiritual functions. He was becoming both corrector of his people and governor of his clergy. An increasingly complex society and expanding church activity in the 12th century forced the division or delegation of the bishop's role. Archdeacons, the eyes of the bishop, were appointed in each diocese over groups of deaneries, to bear some of the administrative and judicial burdens (the huge diocese of Lincoln had eight archdeacons, Ely one). By the end of the Middle Ages each diocese had a complex system of government that permitted every function of the bishop to be carried out by a substitute.

The absence of a diocesan bishop from his see, a common feature when he served as senior official in royal governments, in no way inhibited the work of the church in the diocese. The bishop simply appointed a suffragan bishop (Welsh or Irish bishops, or bishops with foreign titles, were usually available) to confirm children, confer holy orders, or consecrate new or defiled churches, churchyards, or holy vessels. A vicar general from among the senior clergy supervised all administrative arrangements. On the bishop's staff was usually an official principal, who presided in his name over the regular monthly consistory court, where misconduct could be corrected and canon-law cases touching matrimony or debt were heard, since the church was concerned with the consequences of breach of sacred vows.

There was also, usually, a commissary general, who held a peripatetic court dealing with probate business; the church was expected to protect the goods of orphans and widows. The rural dean remained a useful link between the bishop and his clergy, since most archdeacons were absentees (and considered as doubtful entrants into heaven: "Can an archdeacon be saved?"). They too appointed deputies, archdeacon's officials, who at least ensured that the archdeacon's fees were paid and his dues collected. The registrar of the diocese recorded the acts of the bishop and his staff, a record essential as an immediate

source of information and as the main material for the historian of ecclesiastical administration.

Diplomacy

Diplomats were the king's representatives in foreign countries. The development of royal power and authority in the 13th century and the need for proper representation in relations abroad lay behind the development of the English diplomatic services from the reign of Henry III onward. Two additional factors encouraged this evolution. One was the growth of international trade, with a corresponding need to protect commercial interests. The other was the breakup of the old established links with France, with the resultant hostility that characterized relations between the two countries from the late 13th century onward. What came to be known as the Hundred Years War occurred at a time when the relations of England not only with France but with other European countries were becoming more complex, requiring a greater measure of attention from an increasingly professional body of men.

By common practice diplomats were generally treated with respect. As representatives appointed by the king and carrying powers enabling them to treat on his behalf they were usually men of rank and dignity. An embassy, especially one concerned with broad issues, might include one or more members of the greater nobility, a high churchman, such as a bishop, other clergy, knights, and merchants, all of whom enjoyed the king's personal confidence. The rank of the diplomats helped to show the importance attached

to particular negotiations.

To make the diplomatic effort worthwhile and more effective those sent to treat were provided with files of the papers submitted by their predecessors on the same mission, the intention being to lend continuity of approach to relations with a particular country, continuity best achieved if the diplomats were briefed regarding those who had gone before, the arguments that had been prepared, the demands that had been put forward by both sides, and knowledge of how those with whom they had negotiated had responded.

This need for continuity of approach had already been acted upon in the reign of Henry III with the appointment, before 1268, of John of St. Denis as keeper of papal bulls and the nomination, a generation later, of the lawyer Philip Martel as keeper of the king's memoranda concerning Aquitaine. Both men were in effect archivists, whose main task was to help the members of embassies prepare themselves for their foreign missions by giving them the chance of briefing themselves by reading their predecessors' papers.

Such preparation might help an embassy pursue a consistent policy, something that might also be achieved by sending the same ambassadors more than once to the same country. Since diplomacy involved negotiations concerning trade, land, rights of various kinds, or royal marriages, it became essential for every embassy to have among its members at least one recognized expert in law, usually civil law. Thus, when proposals were made or terms agreed, the lawyers had the task of ensuring that England's rights, or those of its king, had been properly protected. Experts in law, both civil and canon, were thus in demand. When Edward II helped establish the King's Hall at Cambridge, he acted in part with the intention that the new institution should be a place where some of the crown's future servants, learned in the law, might receive their training.

To be chosen for an embassy was a clear sign of honor and royal confidence. The skills required of ambassadors were many: social, linguistic, and intellectual. However, in an age that eventually saw the beginnings of permanent embassies in Italy, opinions regarding diplomats varied. To some they were men worthy of respect; to others, glorified spies, protected by conventions that acted in their favor, men whose movements should be strictly guarded, even restricted, and most certainly observed by their hosts. As is the case today, diplomats were never free of suspicion on the part of those to whom they were accredited.

Discant (Descant), English

A basic musical technique, *discantus* at its simplest was no more than a progression of two-part consonances. If one singer sang a preexistent melody, the other singer could improvise the added part. *Discantus* was taught in the 14th and 15th centuries, both as part of a wide-ranging course and as the subject of independent treatises. These latter are not to be seen in isolation, but they indicate a more pragmatic approach to musical education, whereby quick progress toward improvised polyphony could be made by those who needed it for professional purposes. *Discantus* was taught to boys, as well as to adults, as part of the basic training needed by all church musicians; and some of the written material is in English rather than Latin.

The 15th-century composer Leonel Power, in his short treatise (BL Lansdowne 763, fol. 105v), shows how suitable intervals may be selected against a series of schematic “plain-songs,” avoiding, for example, consecutive parallel perfect consonances. He also discusses the system of “sights.” Depending on his vocal range, the singer would imagine a note against one in the plainsong on the same staff and automatically transpose it to an equivalent within his vocal range. There were three sights of descant properly so-called: the quatreble, the treble, and the mean. In the quatreble sight, according to Power, the note an octave below the tenor “in sight” corresponded to a unison “in voice” and so on. An anonymous continuator, however, makes the quatreble unison “in sight” a twelfth above “in voice”; the treble unison in sight was an octave above in voice, and the mean unison in sight was a fifth above in voice. (Needless to say, the visualized intervals were not themselves

necessarily consonant; for example, a “mean” singer, in order to produce a sixth, which is an imperfect consonance, had to visualize a second, which is dissonant. The advantage to those learning descant was presumably that it allowed their eyes to be glued to the staff on which the plainsong was written; with practice, fluency would be achieved and the visualizing would become unnecessary.)

The continuator also deals with the sights of counter tenor, counter, and faburden. Sight and voice were identical for the countertenor, while for the counter the unison sight was a fifth below in voice. The faburden sight was the same as that of the counter, though the number of possible intervals was reduced to two because of the parallel fourths between the plainsong (here in the middle) and the upper voice.

Simple though these rules would have been for singers, the writers were conscious of artistic values. As the anonymous Lansdowne writer put it, “It is faire and meri singing many imperfite cordis togeder.” Others, such as Richard Cutell of London (Bodleian Library, Bodley 842, fol. 48), agreed. Although a number of other such treatises exist, they do not add substantially to this doctrine. One of them (BL Add. 21455, fol. 9v) confirms that the notion of *discantus* was applicable to instruments as well as voices, but none ventures beyond the note-against-note stage, to which they sometimes also give the name “counterpoint,” or *contranota*.

Yet we know from other evidence that more complex forms of multiple improvisation took place. Two related passages in 14th-century treatises describe collective improvisation in four or even five parts, the top one being highly ornamented. At that stage parallel perfect intervals were still allowed in more than two parts. Such progressions were forbidden in 15th-century (three-part) faburden, which represents a taming of wilder musical instincts; but it too gave rise to ingenious possibilities, as certain traditional detached faburdens seem to suggest. Perhaps the greatest potential for improvised *discantus* lay with the organ; but in any case the treatises of the late 14th and early 15th centuries offer a fascinating insight into the earliest formal training that budding composers in a great period will have had.

The term “English discant” (or descant) is applied in modern writings to two fundamentally different methods for the composition of written polyphony of the later 13th through the earlier 15th century. Normally both are notated in score for three voices that are differentiated by range but move in similar rhythms and sing the same text. Some of these pieces are freely composed and treble-dominated, with a counterpoint involving frequent chains of parallel imperfect consonances. Their style is sometimes referred to as “cantilena-style” because of its frequent appearance in the English cantilena repertoire. “English discant” is more appropriately reserved for the other kind of piece, composed

on a *cantus firmus* (normally the middle voice of three) using the note-against-note techniques of *discantus*. The simplest of such written chant settings approach the mechanical parallelism of *faburden*, especially in settings of long ritual texts like the Credo and Te Deum, but more often their style is slightly elevated, exhibiting contrary motion in the counterpoint and some degree of rhythmic elaboration in the outer voices.

Dives and Pauper

A long ME prose treatise on the Decalogue, or Ten Commandments, of about 200,000 words. It is a work of religious instruction in the form of a teacher-pupil dialogue between a “rich man” (Dives) and a “poor man” (Pauper)—specifically a rich layman and a poor (though highly educated) cleric. Internal evidence indicates that it was written between 1405 and 1410. Eight manuscripts of the text survive, with five text fragments, all written in various Midlands dialects of ME. The tract is anonymous, apparently deliberately so, inasmuch as its subject matter was theological in a period when opinions expressed on theological matters, especially in the vernacular, were closely scrutinized for traces of heresy or sedition.

The author has, however, left a number of clues in his text to his personality and attainments. Judged by his use of the Bible, canon law, patristic writings, and contemporaneous sources, he was a university-trained Franciscan cleric. In the spirit of his times, as well as of his profession, he placed a high value on preaching and on penitence. The drift of the dialogue suggests that one of the author’s targets is not so much the ignorance or sinfulness of the rich layman but rather his leanings toward Lollard, or proto-Puritan, views on such matters as images in churches, jollity on the sabbath, or pomp in burials. On other topics, however, Dives already agrees (or is easily persuaded to agree) with Pauper: for example, that the first commandment forbids witchcraft and astrology; that the fourth commandment includes the veneration of such “fathers” as prelates, lay patrons of churches, and angels; that the seventh commandment enjoins fair prices; and that the eighth commandment, under the rubric of false witness, covers the symbolism of church vestments and the portents of the Last Judgment. The choice and treatment of these latter topics is conventional and unique only in being considerably more extended than in other Decalogue treatises of the period.

This evidence, taken together with a sermon cycle recently found by Anne Hudson to have been written by the same author (Longleat House, Wiltshire, Marquess of Bath 4), suggests a somewhat independent-minded mendicant preacher, one persuaded of the urgent need to reform certain clerical abuses but cautiously treading the line between sharp criticism and outright heresy. He is last seen (in the prologue to the Longleat sermons) taking refuge under the wing of an unnamed, powerful lay patron from those who would silence him. His story is a precursor to that of Reginald Pecock a generation or so later, with the difference that, by Pecock’s time, positions had hardened. By the 1450s appeals to the lay conscience and vernacular discussion of church doctrine and practices had become prosecutable offenses.

No holograph of *Dives and Pauper* survives. The manuscripts and manuscript fragments are datable within the last three quarters of the 15th century on the basis of their handwritings. One manuscript (New Haven, Yale

Beinecke 228) is dated 1465 by its scribe and said to have been written in a Lisbon monastery. The others are unsigned and undated. The manuscripts and fragments fall into two main groups. The larger, earlier group of five includes Glasgow, University Library Hunterian 270, which has been used as the base manuscript for the modern, EETS edition of the text. The smaller, derivative group includes a manuscript (Bodl. Eng.th.d.36) used as the basis of a black-letter edition of the text by the early printer Richard Pynson in 1493. Pynson's edition was reprinted in 1496 by Wynkyn de Worde and in 1536 by Thomas Berthelet, both reusing Pynson's printed text. This late pre-Reformation appearance of *Dives and Pauper* attests to a continuing interest in its subject matter as well as to its fundamental doctrinal orthodoxy.

While modern students of medieval England read *Dives and Pauper* for various reasons, a central one is the evidence it gives for the nature of Christian belief and practice at the close of the period of Chaucer and Langland. In 1401 the death penalty for heresy was enacted, and in 1407–09 further laws were instituted limiting vernacular preaching and writing on theological matters. The author of *Dives and Pauper* inveighs against these new limitations but does so anonymously. Though he chose to omit discussion of such vexed topics as the eucharist and to circumscribe his discussion of such others as baptism or the powers of the priesthood, his doctrinal caution is linked with an urgent plea for the reform of a number of ecclesiastical and pastoral practices. In this respect *Dives and Pauper* is closely related to the sermons and works of popular religious instruction of its period.

As an example of ME prose *Dives and Pauper* has been less well studied. Its style is occasionally tedious but quite often lively and pithy, and it is varied by the inclusion of poems, exempla, and anecdotes. In its exposition of the Ten Commandments it provides independent translations of passages from the Vulgate that are of interest to students of the early English Bible. Its vocabulary is copious. The first edition of the *OED* drew heavily on the Pynson and Wynkyn de Worde printings, in which words and spellings had been changed to then-current forms, for evidence of late-15th- and early-16th-century usage.

Finally *Dives and Pauper* has been used as a source of knowledge of the rites, vestments, and customs of the late-medieval English church (Rock; Aston), of folk beliefs (Thomas), and of the roots of medieval drama (Kolve).

Domesday Book

At Christmastide, 1085, almost twenty years after William duke of Normandy had conquered England, the king "had deep discussions with his council about this country, how it was peopled and with what sorts of men." After these discussions he ordered a kingdomwide inquest to be held. According to a disapproving contemporary, "so very thoroughly did he have the kingdom

investigated that there was not a single [piece of land] ... or even (it is shameful to record but did not seem shameful to him to do), one ox or one cow or one pig that was omitted from his record; and all these records were afterward brought to him" (Anglo-Saxon Chronicle, E-Text).

The results of this inquest are recorded in Domesday Book, the first "public record" in English history and a document that resides today in London. Its entries, with relatively standardized, detailed, and quantified information for nearly every farm and village in 11th-century England south of the River Tees, constitute the most complete body of statistical, tenurial, and geographical data on medieval England. The amount of information is staggering, well illustrating Williams administrative genius. We have detailed information on some 45,000 landholdings across the kingdom. The document preserves information on peasant population, agricultural productivity, tax assessment, and land values—recording thousands of mills, pastures, woodlands, ironworks, and slavewomen.

Of equal importance, Domesday records names. Generally the document tells us who held the manors and farmsteads both in January 1066—immediately before the Conquest—and in 1086, the year of the Domesday inquest. The survey also records the names of the subtenants, retainers, and allies of great Saxon and Norman lords. It notes the tenures by which Saxons and Normans held their land and on occasion preserves their legal disputes and the land transfers they made. This vast array of tenurial and manorial information is organized geographically; we can identify the great bulk of Domesday places—some 14,000 in all—and thus locate lordships, swine pastures, waste land, or areas of highest value in 11th-century England.

Domesday Book bridges the Norman Conquest, describing manorial conditions as they existed in 1066 and again in 1086. Hence it discloses the wealth, power, and political structure of two distinct cultures and societies and illuminates the revolutionary transformation in landholding that the Norman Conquest brought about. Although occasionally ambiguous, inaccurate, or incomplete, Domesday Book is singularly reliable by standards of prescientific societies. It has rightly been called "the most remarkable statistical document in the history of Europe." Indeed no land survey until the 19th century approached its comprehensiveness or detail. Used cautiously, and with the realization that its figures represent approximations rather than exact numbers, Domesday Book provides us with our best evidence for the political, economic, and social history of 11th-century England.

Douglas, Gavin (ca. 1475–1522)

Scottish poet, churchman, and courtier best known for his translation of Virgil's *Aeneid* (*Eneados*, 1513). Other works include a dream vision, *The Palice of Honour* (1501), and possibly a brief poem on church corruption, "Conscience" (after 1513). The allegory *King Hart*, despite later attribution, is probably not by Douglas. The *Eneados* survives in several manuscripts, of which the early-16th-century Cambridge, Trinity College 1184, is the basis for the most recent scholarly edition (Coldwell); no manuscript of *The Palice of Honour* is extant, but it can be found in three 16th-century printed editions.

A younger son of an earl of Angus, Douglas was drawn to ambition and conflict, both at church and court. His poetic efforts were at least partly intended to attract patronage. Educated at St. Andrews and possibly Paris, he became bishop of Dunkeld in 1516, but the family fortunes declined soon afterward. Douglas ended his life in exile in England.

Douglas's literary output reflects his wide reading in Scots and English vernacular writers, continental poets, and Italian humanists. In both his major works he is deeply proud of his Scottish language yet equally aware of his ambition in introducing classical and continental forms into "rurell termes

rudd" (*Palice* 126). Indeed much of *The Palice*'s stylistic power lies in its leaps between highly rhetorical "aureate" language and colloquial diction. *The Palice* shows an encyclopedic command of the conventional motifs of courtly allegory, but it also has descriptive flair and vivid, often comic, dramatic settings. Its narrative centers on the various approaches to honor, through chastity, faithful love, and especially through poetry itself. This looks forward to the *Eneados*, in which lay Douglas's greatest hope for honor and worldly immortality.

The ambitious task of gathering a whole prior tradition into a new language and culture also characterizes the *Eneados*. Douglas seeks to bring not merely the text of Virgil but also the whole medieval and Renaissance Latin tradition surrounding that text to a noble Scots vernacular readership. In addition to the justly famous Prologues to the books of the poem Douglas provides a framework of prose commentary, chapter division, and verse summaries that closely imitates the structure of Latin Virgil manuscripts and early printed editions.

The Prologues are simultaneously apologetic and boastful. They regret the "difference betwix my blunt endyte / And thy scharp sugarate sang Virgiliane" (I Pro. 28–29), and they defuse attacks on Virgil's pagan content by proposing euhemerist, astronomical, and christianizing interpretations of the gods. Yet they criticize Caxton's and Chaucer's earlier English versions of the story. Despite Douglas's modesty about his native tradition the Prologues display formal and stylistic variety as great as that which he praises in Virgil: heroic couplets, rime royal, alliterative stanzas, and other forms.

Douglas's translation itself, which replaces Virgil's hexameters with heroic couplets, is remarkably faithful to Virgil, in both spirit and detail. If Douglas rarely captures Virgil's quieter metrical nuances, he consistently succeeds with scenes of action and the more emotional speeches. He expands on Virgil at various points, sometimes adding brief explanations of Virgilian terms (usually derived from Latin glosses on the poem) and sometimes putting additional emphasis on Aeneas's political role. But even more, Douglas's expansions reflect his own readerly enthusiasms: naval technology, storms, hunts, landscapes, and battles. Here, even more than in the artificial structure of the Prologues, Virgil and his Scots translator coalesce into a single, if extended, voice.

Drama, Latin Liturgical

Although surviving records document a wealth of dramatic activity in medieval England, the number of extant texts of Latin liturgical dramas is surprisingly small. Even allowing for the destruction of the vast majority of liturgical books copied in medieval England, one is forced to question the degree of popularity of pure Latin drama, performed within the liturgical ritual and sung throughout, as compared with, for example, mimes and pageants, the enterprises of traveling players, and, most especially, the highly creative vernacular dramas (into which musical pieces were inserted but which were delivered mainly through speech). Nonetheless, given the vast chronological spread of the surviving Latin sources (from the last quarter of the 10th century through to the early 15th century), as well as echoes of the Latin tradition in vernacular plays, it is possible to argue for greater familiarity in England with genres of Latin drama than the extant text sources actually demonstrate.

The earliest English sources of Latin liturgical drama are all associated with Winchester in the last quarter of the 10th century and the first half of the 11th. The *Regularis concordia*, a code of monastic law (“The Monastic Agreement of the Monks and Nuns of the English Nation”) issued after the Council of

Winchester (ca. 973) principally under the guidance of Bishop Æthelwold, includes the text of a *Visitatio sepulchri* to be performed after the third (i.e., last) responsory of Easter Matins. Fashioned around the famous *Quern queritis* (“Whom do you seek?”) dialogue, this play is strongly marked by the attempt to identify both sung texts and actions with the relevant Gospel narratives; it is thus one of the earliest examples of the *Visitatio* that explicitly depends on a high degree of representational interest. Two additional features of the *Regularis concordia* drama are significant: first, it represents the earliest record of performance of the *Quern queritis* dialogue at Easter Matins (rather than before the mass Introit, or during the procession before mass). In this transferred position Easter plays were eventually to develop much larger proportions. Second, this Winchester version brings together elements of western and eastern Frankish text traditions, presumably through English contact with a variety of continental Benedictine establishments, in particular Fleury and Ghent.

Neither source of the *Regularis concordia* has musical notation, but this can be supplied from two closely linked sources of the same period, the so-called Winchester Tropers (Cambridge, Corpus Christi College 473, and Bodleian Library, Bodley 775). The Easter drama copied in these books adds one speech to the *Regularis concordia* version, effectively dividing the drama into two episodes. The first deals with the dialogue between women and an angel at the sepulcher and the women’s announcement of Christ’s resurrection to the community gathered to worship; the second deals with “proof,” that is, an invitation from the angel to “come and see the place where he was laid,” and the women’s subsequent second announcement of the Resurrection. The music notated for these speeches is that normally associated with the trope and chant texts in other liturgical contexts; here, as in most Latin liturgical dramas, texts and music tend not to be newly composed.

The only other sources of Latin liturgical drama from medieval England both come from convents and thus indicate the involvement of women in dramatic performance within churches. A 15th-century ordinal (a collection of liturgical ceremonies) of Barking Abbey (Oxford, University College 169) includes an Easter *Visitatio sepulchri* composed by Katherine of Sutton, abbess of the nunnery from 1363 to 1376. Following a particularly impressive *Elevatio* ceremony (placed, unusually, between the end of Matins and the *Visitatio*), this Easter drama shows how an energetic but judicious spirit could fashion a dramatically effective and exciting play while avoiding the frivolity and misbehavior so often cited by clerics opposed to the performance of plays.

Both this and an Easter *Visitatio sepulchri* from the convent of St. Edith’s, Wilton (now preserved only in the form of a 19th-century copy of a 14th-century original: Solesmes, Abbaye-St.-Pierre 596), indicate strong links with

forms of drama practiced in French Benedictine convents, especially Origny-Ste.-Benoîte. The Barking and Wilton plays place considerable emphasis on narrative aspects of the Easter story, especially the approach of the three Marys to the tomb and Mary Magdalene's encounter with Christ in the garden. This move away from the earlier highly concentrated and brief ritual dramas centered on *Quem queritis* to longer narrative structures involving a series of tableaux accords with the European trend.

Two further sources of an Easter *Visitatio* from Dublin (Bodl. Rawlinson D.4; Dublin, Marshs Library Z.4.2.20) probably derive from English practice; both manuscripts (processionals of the late 14th and early 15th centuries) include liturgy of the Sarum type and are copied in the same manner as English liturgical books of the period.

Of other types of Easter or Christmas liturgical dramas only traces remain: the early-15th-century Shrewsbury fragments from Lichfield Cathedral (Shrewsbury, Shrewsbury School VI) demonstrate, through their quotation of specific Latin texts, direct knowledge in England of the *Officium pastorum* and *Officium peregrinorum* traditions. Both types were first created in Normandy in the late 11th century. References in documents from Lincoln Cathedral indicate the performance there of a Magi play. There is no way of knowing whether this was performed in Latin, as part of the liturgy; it does, however, show contact in England with one of the oldest text traditions of Latin liturgical drama.

Drama, Vernacular

Vernacular plays in medieval England fall into four principal categories: three forms of religious drama (biblical plays, morality plays, and saints plays) and the folk drama. A few dramatic texts that do not fit into these categories also survive.

Vernacular religious drama took its impetus from the educational concerns expressed by the Fourth Lateran Council of 1215 and reiterated frequently over the succeeding centuries. The council sought to educate the laity in the basic stories and doctrines of the church so that they could participate fully in the sacraments. In this way the drama has a common genesis with other didactic literature and art of the period. Unlike the Latin mimetic embellishments of the liturgy that remained in the hands of the clergy the vernacular drama from its first appearance seems to have been performed for and largely by the laity. We have no information about the authors of this drama; the plays are the work of anonymous playwrights in every part of the country.

Biblical Plays (Cycle Plays, Mystery Plays)

The most common form of vernacular drama was episodes telling the stories of the Bible. Because the majority of these plays have survived in manuscripts containing collections of plays with the episodes arranged from Creation to Judgment, it has been common critical practice since the 19th century to refer to them as cycle plays and to treat the four major collections as variants of the same form. Since the work of Prosser and Kolve it has also been a critical commonplace to call these collections Corpus Christi cycles or plays and relate the themes of the drama to the Feast of Corpus Christi. Recent scholarship, however, has demonstrated the radical differences among the four surviving major collections and has determined that only one of the collections

containing the whole sweep of salvation history, the York Plays, was regularly performed at Corpus Christi. Because these biblical plays were often performed by craft guilds, they are also called mystery plays, from the ME and Old French word *mistere*, “craft, trade.”

The unique manuscript of the York Plays is in the British Library (BL Add. 35290). There is also one manuscript of a single craft copy. The complete manuscript is an official “register” copy compiled for the city council in the late 1460s or 1470s. There are 48 separate episodes in the manuscript, and it is possible that at one time there were 56. The plays were produced in a cooperative annual enterprise at Corpus Christi by the corporation of the city of York and the craft guilds of the city. The first possible mention of the play is a record of the rental for the storage of a pageant wagon (possibly one of the stages) in 1376. The final performance of the play was in 1569.

The plays were performed by a mixture of professional and amateur actors, all of whom auditioned annually for the city council. Because there was no large open space within the walls of the city over which the council had jurisdiction, the producers of this play devised an unusual method of performance, playing each episode in procession from wagons that stopped to perform at designated “stations” along a predetermined route. The normal number of “stations” was twelve, but there could be as many as sixteen places offered for rent by the council. The York Plays are an exciting series of episodes of great verbal complexity that have an internal unity of theme emphasizing the teaching ministry of Christ and exhorting the audience to live a good life in this world.

The plays from Chester are preserved in five complete manuscripts, two single episodes, and one fragment. The earliest complete manuscript is dated 1591, sixteen years after the last performance of the plays in 1575. Recently discovered evidence indicates that none of the surviving texts of the Chester plays represents with complete accuracy the text as it was being performed as late as 1572. The plays were first edited for the Shakespeare Society in the 19th century. In the course of their work for the new EETS edition Lumiansky and Mills came to some radical conclusions about the nature of the preserved manuscripts, arguing that they represent a “cycle of cycles” containing every possible variant of each episode rather than presenting the text of the plays as they were performed at any one time (1983: 86). The text contains 24 separate episodes.

Although there seems to have been a Passion play performed by the Chester clergy in the 15th century, the plays as we have them could not have been written before 1521. There is evidence for only seven performances of the Chester sequence between 1546 and 1575. They were produced as in York by the city council and performed by the craft guilds with a mixture of amateur

and professional players. The sequence normally ran for three days at Whitsun (the Feast of Pentecost) and was performed in procession at four stations. Unlike the situation at York, where the guilds continued to control their texts, at Chester the city council controlled the text, determining each year the content of each segment. Each guild either owned or shared in an elaborate carriage. The Chester plays are written to emphasize the miracles of God and Christ and contain many striking visual effects, sometimes built into the carriages and sometimes achieved, as in the powerful passion sequence, by arranging the actors in the familiar postures of artistic renderings of the same scenes.

The Towneley Plays are preserved in manuscript HM 1 in the Huntington Library in San Marino, California. It was the first collection of early plays to be edited, appearing in a Surtees Society volume in 1836. The manuscript, dated after 1500 (Cawley and Stevens, 1976), contains 32 episodes. Because the name "Wakefield" appears on the first folio of the Creation play and because there are some possible local allusions within some of the plays, considerable work has been done seeking to associate this collection with the town of Wakefield in the West Riding of Yorkshire. However, modern scholarship has cast serious doubt on this association and the evidence adduced to support it. Thus, although many critics have come to call this collection the "Wakefield Cycle," it seems more accurate to call it "Towneley" after the family first known to have owned the manuscript.

It seems most likely that the Towneley collection is an anthology gathering together the plays being performed in the West Riding of Yorkshire and placing them in the order of Creation to Judgment, perhaps, as Stevens has argued, as "something like a presentation copy of the play for the safekeeping of the lord of the manor or some other eminent person" (1987: 94). Some of the episodes are clearly written for wagon performances, but others demand a "place and skaffold" configuration, using raised platforms or "skaffolds" and the ground or "place" in between, as in the Offering of the Magi and Resurrection plays. There are many anomalies among the episodes that support the idea that it does not represent a sequence that was ever performed as a unit: for example, there are two Shepherds' plays but no play on the birth of Christ, and the series is riddled with inconsistencies of character, event, and theology from one episode to another. The manuscript contains at least five plays that were borrowed from York and then altered to fit their new situation. Some of the alteration was done by the playwright considered by critics to be the most outstanding writer in the genre, the so-called Wakefield Master. The Master also wrote six separate episodes on both Old and New Testament topics, including the two Shepherds' plays, the *Prima* and *Secunda Pastorum*. The theological message of the plays associated with the Master (as well as

some others in the sequence) is overwhelmingly penitential, with a deep concern for the need to die in the faith. Of all the collections this one seems most embedded in the society of 15th-century England.

The manuscript that is preserved as BL Cotton Vespasian D.viii has had three titles. It was first mistaken for the plays from Coventry and so appears in most bibliographies as the *Ludus Coventriae*. Hardin Craig called the collection the Hegge (pronounced “hedge”) Cycle, after the family that owned the manuscript. Most modern scholars now refer to the collection as the N-Town Plays because the banns that appear at the beginning of the manuscript announce that a play will be performed at “N-Town.” The collection was first edited by John O. Halliwell for the Shakespeare Society in 1841. The manuscript is dated after 1468 and comes from East Anglia. Modern scholars are agreed that, like the Towneley collection, this is an anthology of pageants and plays based on biblical and apocryphal material including over twenty pageants; a five-episode play on the childhood of Mary; a two-part Passion play; and a play on the Assumption of the Virgin. Some of the plays demand staging on pageant wagons, others a single fixed stage, and still others a place-and-scaffold arrangement. The collection is remarkable for its emphasis on the Virgin Mary, not only in its two separate Mary plays but also in the prominent role given to Mary in the Passion play.

The biblical sequence in Cornish, called the *Cornish Ordinalia*, survives in one medieval manuscript (Bodleian Library, Bodley 791; late 14th century) and in two postmedieval copies (Bodley 28, 556–57 and National Library of Wales Peniarth 428E). The sequence covers events from the Creation to the Ascension and is organized in a different manner from the English sequences, using the legend of the True Cross as a binding thread throughout the play. The play seems to have been performed from the late 14th century to the 16th. The action, which took place in a round playing space over a three-day period, is continuous.

Episodes from what were once longer sequences also survive. Two episodes, the Nativity sequence and the Presentation of Christ in the Temple, have come down to us from what was a ten-episode play performed by the city of Coventry and its craft guilds. A 16th-century manuscript version of the Weavers’ Presentation pageant remains in Coventry, but the only version of the Shearmen and Taylors’ Nativity pageant now extant is that published by Thomas Sharp in 1817. From the extensive documentary evidence that survives it is possible to reconstruct the performance history of the sequence, from the late 14th century until its last performance in 1579. The play was performed from wagons in procession at Corpus Christi, but it does not seem to have had an Old Testament sequence of plays, beginning instead with the birth of Christ. The later episodes featured such allegorical characters as the Worm of

Conscience and the Mother of Death, indicating that the sequence contained allegorical or morality elements as well as biblical ones.

Another city whose sequence of plays has been lost is Newcastle-upon-Tyne. Only one play survives: Noah's Ark, found in an 18th-century printed edition. The records of the city show that the sequence contained at least 25 episodes, from Creation to the Death of the Virgin. The play was played in procession on Corpus Christi Day, but the pageants were carried rather than wheeled through the city. The surviving episode contains the unusual feature of the Devil counseling Noah's wife not to enter the ark.

The city of Norwich also had a play sequence of twelve episodes from Creation to Pentecost. It was played at Corpus Christi until the first quarter of the 16th century and then at Whitsun. The Creation and Fall of Man is the only surviving episode; it exists in two fragmentary versions, first printed in 1856. The manuscript has been lost. The pageant is remarkable for its theological foreshadowing of Pentecost, achieved by the Holy Ghost's appearance at the end of the play to console Adam and Eve.

Two complete Abraham and Isaac plays, a Candlemas play, a two-part Easter play, a Cornish Creation play, and several fragments of plays on other biblical topics have also been preserved. On the analogy of the plays from Coventry, Norwich, and Newcastle these have been traditionally thought to be scattered survivals of other longer sequences of plays. However, recent research into the external evidence for playmaking in England (*Records of Early English Drama*, 1979-) is demonstrating that many towns and parishes all over the country performed single-episode plays. The surviving single plays probably represent that tradition. One important manuscript, the "Shrewsbury Fragments," represents a single actor's part in three separate episodes of the Shepherds, the Resurrection, and the Journey to Emmaus. There is also external evidence of a complete biblical sequence performed in the Yorkshire town of Beverley, although no text survives that has been identified as part of that sequence. Chronicle evidence records a complete sequence performed over several days in London at Skinners' Well in the late 14th and early 15th centuries (Lancashire, 1984: 112–13). Several towns presented biblical as well as other scenes in tableaux (using effigies) or tableaux vivants (using human actors) in their religious and civic processions.

Morality Plays

The second major genre of religious drama is the morality play, in which a central figure is tempted by forces of evil and defended by forces of good. The

antagonists are sometimes demonic figures and sometimes allegorical representations of psychological characteristics, such as Sloth or Humility. Few examples of the genre survive from before 1500, but it is assumed that many of the unspecified plays mentioned in the records, particularly plays performed by the many touring troupes, were morality plays. In the 16th century this genre was popular in such school plays as the *Wit and Science* group, whose central figure is a student seeking a good education. The genre was also used for political purposes in plays that give advice to rulers, such as Skelton's *Magnificence*. Both sides of the religious debates of the 16th century used the form for propaganda purposes.

Four complete "medieval" morality plays survive in English, three in 15th-century manuscript form and one from early-16th-century printed editions. Three of these plays (*Mankind*, *The Castle of Perseverance*, and *Wisdom*) are preserved in Folger Library V.a.354, a collection of three separate manuscripts bound together in the early 19th century. The dialect of each of these plays places it in East Anglia, but no exact location has ever been determined. They were all once owned by the Rev. Cox Macro and so have been edited for EETS as *The Macro Plays*. An incomplete version of *Wisdom* is also found in Bodl. Digby 133.

Mankind concerns the initial fall into sin and repentance of a mankind figure who is represented as a farmer. He is caught between the moral arguments of Mercy, a clerical figure, and the attractive antics of four vice figures, Mischief and his three henchmen, Nought, Newguise, and Nowadays, aided by the demonic figure of Titivillus. The play is presumed to have been played by a traveling company of six actors with the parts of Mercy and Titivillus doubled. It contains a blatant begging passage, in which the actors go among the audience demanding money before the appearance of the devil figure. The play was written for a booth stage setting (a single stage built of planks laid on trestles or barrels and hung with curtains) that could be placed either indoors or out. Despite the bucolic setting the language is dense and academic, at times heavily laced with latinate phrases for both serious and comic effect.

The Castle of Perseverance, a much more elaborate play than *Mankind*, demands an extensive set and a large cast and seems to represent an alternative form of town drama to the biblical sequences. A unique stage plan survives in the manuscript, providing us with details of the set and some costumes. The entire life story of its central figure, Humanum Genus, is told by the play. Humanum Genus is born into an allegorical world represented by a circle of "scaffolds" representing the World, the Flesh, the Devil, Covetousness, and Heaven. The circle is dominated by the Castle of Perseverance itself standing in the center. Schematically flanked by a Good and a Bad Angel,

Humanum Genus is tempted by the seven deadly sins or vices, falls, repents, and is taken into the Castle by the seven heavenly virtues. The Castle is then besieged by the forces of evil, and in an exciting battle sequence the virtues triumph. In his old age, however, Humanum Genus succumbs to the temptation of Covetousness and dies in sin, when his soul is carried to hell. The final sequence of the play is a debate among the Four Daughters of God (Mercy, Justice, Truth, Peace; cf. Ps. 85:10–11) about whether the soul should be saved. God finally agrees to the souls salvation. The play is written mainly in thirteen-line stanzas that seem wordy when the play is read. In performance, however, the repetitive verse carries the theme of the play to an audience seated around a large playing area. The playwrights have clearly fashioned their verse for the performance situation.

Wisdom seems to have been written to be performed in a hall setting for an upper- or middle-class lay or possibly monastic audience. The central figures are Wisdom or Christ and Anima or the soul of man. Three further characters—Mind, Will, and Understanding—represent aspects of Anima who are tempted by the Devil and fall, causing Anima to appear “in the most horrybull wyse.” Exhorted to repent by Wisdom, she does so, and her former state is restored. The play is full of music and courtly dancing demanding lavish costuming, much of which is specified in the stage directions. The moral lesson is strongly carried in many speeches that come close to being short sermons.

The fourth English morality play, *Everyman*, was first published by Richard Pynson ca. 1515. It is now generally agreed that it comes from a Dutch original called *Elckerlijc* and so constitutes the one textual connection between English drama and the important morality tradition of the Low Countries. The play covers only the death of the protagonist and begins with the summoning of Everyman by Death. Everyman then searches for help and comfort as he seeks his salvation. He first appeals unsuccessfully to his family, his friends, and his material goods. None helps him, and the midpoint of the play comes with Everyman facing death alone and despairing of salvation. Then, as his physical body disintegrates, Knowledge and Good Deeds lead him to the point of confession, after which he is shriven, dies, and is received into heaven by an angel. The play is written mainly in four-stress couplets, although the playwright varied the pattern frequently for effect. It has a spare dignity without the elaborate display or bawdy humor of the native English plays and appears to have been unusually popular, with four editions from ca. 1515 to ca. 1535.

Three morality fragments have been identified. A long one from the 15th century called *The Pride of Life*, like *Everyman*, is a play about the certainty of death. The central figure, however, is a king who, despite the warnings of his wife, challenges Death to a duel and inevitably loses. Several homilies are

included in the fragment that survives. An East Anglian fragment called (from the single part that survives) *Dux Moraud* dramatizes a well-known medieval story of an incestuous daughter who kills her mother, her child, and eventually her father. In the dramatization the father renounces his sin before she murders him. The fragmentary nature of the text prevents us from knowing whether the play would have ended as its narrative analogues do, with the repentance and conversion of the daughter. The final morality fragments that survive are the extracts copied by Robert Reynes of Acle (Norfolk) into his commonplace book (Bodl. Tanner 407). One is a speech of a character named Delight and the other an epilogue. These fragments are published by Davis (*Non-Cycle Plays and Fragments*).

Saint's Plays

The third genre of religious plays in the vernacular is the saint's play. Records indicate that plays based on the lives of saints were popular in England in the period. These were usually plays about the lives of the patron saints of parishes or guilds, although several on the life of Thomas Becket are recorded. Only three saint's plays survive—two English and one Cornish. *The Conversion of Paul and Mary Magdalene* are preserved in Bodl. Digby 133. Both are from East Anglia and are associated with Miles Blomefylde, a physician, alchemist, and book collector. Both demand elaborate and complex staging. It is possible that they also represent alternative choices for playmaking by the prosperous wool towns of the area in the 15th century.

The Conversion of Paul is based on the Acts of the Apostles and tells the story of Paul with several lively interpolations of comic devils and some spectacular stage effects. It was performed at three stations, and, unlike the practice of the English biblical plays, the audience moved from station to station in a manner similar to some continental civic plays.

The long and complex *Mary Magdalene* combines scenes based on New Testament incidents, such as the anointing of Christ's feet by Mary, the raising of Lazarus, and Christ's appearance to Mary after the Resurrection, along with apocryphal episodes from the earlier and later life of the saint. As is customary in medieval legend, Mary Magdalene is identified with Mary the sister of Martha and Lazarus. The play is in two parts. The first part has a morality structure, as Mary falls to the seduction of the World, the Flesh, and the Devil, repents, and is forgiven by Christ. It ends with the raising of Lazarus. Much of the second part is concerned with the conversion of the king of Marseilles and the death and "resurrection" of his wife in a motif considered by many to have

inspired the “rebirth” of Hermione in Shakespeare’s *Winters Tale*. The play demands a large set arranged, like the N-Town Passion play, in a place-and-scaffold configuration.

The Cornish saint’s play *Meriasek* dates from the early 16th century and is preserved in the Hengwrt manuscript in Peniarth. There is a circular diagram at the end of the manuscript that is presumed to indicate the mode of staging. The play does not involve the conversion of its central figure Mereadocus, bishop and confessor, but rather his healing of the sick. It also involves some spectacular stage business, including the slaying of a fiery dragon large enough to have “swallowed” several soldiers.

Only one surviving fragment of a play text has been positively identified as being from a saint’s play. This is a prologue from a play on the life of Theophilus that is preserved in the library of the Dean and Chapter of Durham Cathedral.

Other Religious Drama

The one surviving text of religious drama that does not fall into the categories discussed above is the *Play of the Sacrament* (ca. 1500). The manuscript is in Trinity College, Dublin (MS 652, Art. 6), although the play is of East Anglian origin. It is identified with a village called Croxton; of the three possible Croxtons in East Anglia scholars generally favor the village near Thetford, Norfolk, close to the pilgrim route to the shrine of the Virgin in Walsingham. The play’s theme, the real presence of Christ in the eucharist, makes it suitable for the Feast of Corpus Christi. The central action of the play concerns a disbelieving Jewish merchant, who, with his friends, mocks and tortures the sacrament. They are punished and then converted by the end of the play. The play contains several staging challenges, including causing the wafer of the Host to bleed and splitting apart an oven to reveal the “image” of the bleeding Christ.

There are two genres of plays for which we have records of performance but no extant texts. These are plays based on the Creed and the Lord’s Prayer. The Guild of Corpus Christi in York and subsequently the city council produced a play based on the twelve articles of the Creed. The text was willed to the guild in 1446 by William Revetour. After 1495 it was substituted for the biblical sequence every ten years. The surviving records have been analyzed in an attempt to reconstruct the content of the play (Johnston, 1975). It was suppressed in 1568. The Corpus Christi play at Coventry (see above) was referred to as a “Creed Play” in 1526.

There are records of plays based on the Pater Noster at York, Lincoln, and Beverley. Early views considered that these were in some way morality plays, but more recent scholarship has suggested that they were more straightforward expositions of the articles of the prayer.

Folk Drama

Folk drama by its very ephemeral nature has until recently been hard to discuss except in terms of anthropological theory and modern revivals. However, the work being done by the Records of Early English Drama project is now documenting widespread instances of folk activities. The records are found largely in parish documents and the records of the 16th- and 17th-century ecclesiastical courts. Whatever their origins, such activities as maypoles, morris dancing, lords and ladies of the summer festivals, hocking (a courting or combat ritual), and Robin Hood plays were common, particularly in the south and west. These communal activities, most often associated with parish fundraising, took place at various times during the spring and summer. The most common date in the south was at Whitsun, in the context of a parish or church ale (a fundraising social gathering). Several towns and cities, such as York, had St. George Ridings. Mumming is less well documented. Revivals in the 18th century have as key elements in the “mumming play” the presence of St. George representing England and a death-and-resurrection sequence of varying seriousness. It is assumed that these and other local activities, such as “pace egging” (an Easter ritual), in some way represent earlier customs. Only one contemporary text for a folk drama survives from the period, *Robin Hood and the Friar*. This was appended to William Copland’s *Gest of Robin Hood*, ca. 1560. The slight text is the occasion for a fight with longstaffs between Robin Hood’s men and those of the Friar, amorous byplay involving Maid Marian, and a lively morris dance.

Drama, Vernacular, Role of Music in

The 12th-century Anglo-Norman *Ordo representacionis Ade* (*Play of Adam*) and *La seinte Resureccion* (*The Holy Resurrection*) apparently represent a flourishing tradition of vernacular drama in England, including a sophisticated structural use of liturgical music. For the next two and a half centuries there survive only a handful of dramatic fragments in English and French, which tell us nothing about their use of music.

From the 15th century, however, a substantial body of biblical plays, saint plays, and moralities survives, representing a tradition that continued well into the 16th century. A biblical cycle, a separate biblical play, and a saint's play, all in Cornish, form a related strand of insular vernacular drama.

Stage directions and dialogue show that music played an important part in this drama, while civic accounts give information on the singers and minstrels who performed. The most important single use of music was to represent heaven: angels singing appropriate liturgical texts or playing *bas* (soft) instruments symbolize divine order, so that music often occurs when God intervenes in human affairs. Mortals who do God's will, such as the Virgin Mary, Simeon, and the shepherds, sing too, in overt or implied imitation of the angels. While the angels were probably sometimes accompanied by soft instruments (harps—*cithare*—are specified in the N-Town Cycle), the mortals almost certainly sang unaccompanied.

Bad characters are also identified through music. Herod's worldly pretensions are shown by the loud music of his minstrels; Mak, the sheep stealer in the Second Shepherds' Play of the Towneley Cycle, demonstrates his out-of-tuneness with God's will by singing out of tune; and Mrs. Noah's friends in the Chester play of the Flood sing a rowdy drinking song.

The forces of evil reverse heavenly musicality in a number of ways, but the actual text sung is always of prime importance. On two occasions the audience is taught a song, rather as is done in pantomimes. In the Chester Shepherds Play the most musical character, Trowle, teaches them a "merry song" (specified as "Trolly lolly lolly lo" in one manuscript) that was no doubt innocent enough: but when the vices in the morality *Mankind* do the same, an apparently innocent first line gives way to a highly indecent text to which the onlookers are committed unawares in advance, presumably to their consternation.

Music has a second set of functions, related to the dynamics of the drama. Music is often heard at the beginning or end of a play, at the entrance or exit of a character, during movement about the acting area or while time passes. While the use of these dynamic functions is not yet entirely clear, it seems

certain that many of the dramatists wrote their plays with music in mind as a structural device.

Music actually notated in the play texts is rare: a single part for nine polyphonic items is in the Shrewsbury plays, the manuscript (ca. 1430) being the sole survivor of a set of three part books; two settings of each of three texts, all in two parts, are in the York Cycle manuscript (written between 1463 and 1477); the Coventry plays include the famous Lullaby and a song for the shepherds, both in three parts and probably dating from the 1530s; and the latest manuscript of the Chester Cycle (1607) has a single-line incipit for a polyphonic setting of the angels' *Gloria in excelsis*, probably dating from the middle of the 16th century. None of these pieces has a concordance, so that those in the Shrewsbury and Chester plays cannot be reconstructed: but the Coventry pieces are justly famous, while the lesser-known York music has been an important element in modern revivals of the spectacular York *Assumption of the Virgin*.

Dream of the Rood, The

In this 156-line, OE dream vision, after a brief introduction, the Rood (the Cross of the Crucifixion) addresses the dreamer, teaching him the significance and mystery of the Cross, Christianity's most important symbol; then the Cross instructs the dreamer to teach others what he has learned; finally the dreamer tells what the experience has meant to him. The poem survives in the Vercelli Book; interestingly fragments of the poem or of an earlier version of the poem—parts of the Cross's speech—are incised in runes on the late-7th- or early-8th-century Ruthwell Cross in Dumfriesshire, Scotland (figs. 111–14: see RUTHWELL CROSS). The Vercelli Book was compiled much later, probably in the late 10th century, but the texts are so similar that they must be closely related to one another, though the exact relationship is not clear. *The Dream of the Rood* itself may date from early in the 8th century.

Theologically the poem manages to stay within orthodox bounds during a time when the cult of the Cross was increasingly popular and several heresies were prevalent. One extreme, the Monophysite or Eutychan position, held that physical agony was impossible for Christ because he was an embodiment of the divine Word, the Logos. Another extreme, the Nestorian or Severan position, argued that the infirmities of Christ's body extended to his soul because he was human. These and other views concerning the corporeality of Christ contested with one another from at least the 5th century to the 6th, with the polemic continuing into the 8th century, despite the doctrine of redemption by incarnation specifying that Christ's divinity and humanity coexist in perfect balance. *The Dream of the Rood* is doctrinally successful in portraying the balance of Christ's divinity and humanity and is at the same time artistically successful in dramatic interaction.

The poem is shocking in a number of ways. When it first appears to the dreamer, the Cross is arrayed in glory, gilded, and gem-adorned but then rapidly alternates between being adorned with the sweat and blood of Christ's suffering and with the jewels signifying his triumph. The next shock comes when the Cross actually speaks to the dreamer; it identifies itself in a form reminiscent of Anglo-Saxon riddles, then narrates the events of the Crucifixion depicting Christ as an Anglo-Saxon hero. According to the Cross Christ bravely mounted and embraced it, forbidding it to bow down to assist its Lord or to attack its Lord's enemies.

Another striking quality of the poem is its parallel relationships that contribute to the didactic purpose. Both Christ and the Cross suffer during the Crucifixion—the Cross specifies that the nails wounded both Christ and itself and that they were both mocked in their suffering. However, the Cross is also like the dreamer who contemplates it; both see and experience Christ's agony without being able to do anything to help their Lord. At the end of the poem the Cross enjoins the dreamer to go out and teach others what he has learned

from the dream vision, so the dreamer is invited to be a teacher like the Cross. Finally the reader can see that he is like the dreamer and can therefore become like the Cross, and by extension like Christ. The diction and imagery of the end of the poem contribute to this final parallel for the Anglo-Saxon reader, since Christ in majesty after the Resurrection is described in language like that of a secular lord surrounded by his thegns. The dreamer, who refers to himself as alone in this world, looks forward to sharing in the joy of the saints who surround their Lord and celebrate the victory that the Cross has so vividly described earlier in the poem.

Dream Vision

A modern term for a shifting complex of generic features and modes gradually assembled from many disparate sources over the medieval period. It has a crucial bearing on the Christian assimilation of pagan literary texts and on the very emergence of vernacular literatures; and in the late 14th century Chaucer invents his own tradition as an English poet by sophisticated and eclectic recourse to it.

The oldest elements in the development of dream vision are mostly religious: biblical, with reference to dreams in the Old Testament (Isaiah, Daniel, Ezekiel, Numbers, and others) and, of paramount importance, the New Testament (Revelation); apocryphal as in the influential 3rd-century *Apocalypse of St. Paul*; and works in imitation of the apocalyptic mode, such as the 9th-century *Vision of Bernold*, written by Archbishop Hincmar of Reims—the subject of which is an eschatological vision of heaven and hell. In the 8th-century *Ecclesiastical History* Bede gives another such vision, that of the monk Dryhthelm.

“Vision” here is the appropriate term: no doubt is permitted concerning the truth of such dreams, and the religious mysteries they unfold are a visualization of theological concepts. Being modeled on the strong witnesses of apocalyptic works, their poet-dreamers are assigned an active role that invites critical exploration of voice. In the earliest dream vision in English, for instance, the 8th-century *Dream of the Rood*, iconography is dramatized as the Cross orders the dreamer to reveal his vision to humanity, and the dreamer speaks both as an individual who has lost his friends and as general human icon of yearning for the next world.

Already at this pre-Conquest stage the Christian dream vision has developed into a dialogue between unequals: the Cross teaches the poet-dreamer, and the element of didacticism is strong in the genre. Models were found outside formal dreams, in the *Soliloquies* of St. Augustine and particularly in the *Consolation of Philosophy* by Boethius—a text that remains vitally influential throughout the “Age of Dream Vision” (Lynch, 1988: 1), lasting from the 12th century beyond the 14th. Classical models of travel to the otherworld are also formative, especially book 6 of Virgil’s *Aeneid* (itself inspired by book 10 of the *Odyssey*). Travel—to salvation or knowledge and expressed in terms of quest or pilgrimage—is therefore closely related in theme to the dream vision. This applies even in the formal absence of a dream, as demonstrated by Dante’s *Divine Comedy*; in which Virgil himself is made Dante’s guide and Boethian interlocutor through hell and purgatory, and a Philosophy-like Beatrice is his guide through heaven.

Another classical source, the Dream of Scipio, embedded in Cicero’s *De república*, grows in importance during the later period. Travel to the heavens leads to the bird’s-eye view that induces notions both of religious salvation

and of secular (often poetic) fame, and the commentary by Macrobius on this text provides the Middle Ages with a comprehensive typology of dream experiences ranging from the prophetic and oracular to the nightmarish and false. As later medieval poets investigate the ambiguities of dreams, they also bring to bear a new interest in the psychology of dreamers, dating from the 12th-century *Liber de anima* of Avicenna.

Whereas the truth value of dream visions is hardly in doubt in 12th-century Latin poetry, such as Alan of Lilies *De planctu naturae*, it becomes an issue in the vernacular dream poetry of the next century. It is 13th-century France that sees the composition of the most potent and popular medieval vernacular dream poem, the *Roman de la Rose*, begun as a courtly psychomachia by Guillaume de Lorris and extended into a kind of encyclopedic Boethian satire by Jean de Meun. Chaucer translated some or all of this poem into English. After the *Roman* dream vision is the genre of genres—of highest status and containing everything; but the term “dream vision” begins to read like an oxymoron, for the claims of vision to tell the truth are juxtaposed with the uncertainty of an ordinary dream.

The nature and possible truthfulness of dreams are an important topic for Chaucer, discussed in book 5 of *Troilus* and in the *Nuns Priest's Tale* as well as in his four dream poems. The opening of *The House of Fame*, like that of the *Roman de la Rose*, invokes Macrobius's dream categories but characteristically declines to arbitrate on their authority, drawing attention instead to the poet's rhetoric. Authority in general—poetic, philosophical, and perhaps political—is problematized in these poems, as the English writer confronts classical authors (Virgil and Ovid in *The House of Fame*, Ovid in *The Book of the Duchess*, the Dream of Scipio itself in *The Parliament of Fowls*) and attempts to construct from and in spite of them his own kind of vernacular literary tradition.

The attempt is heavily influenced by European models, Italian and particularly French. Not only does Chaucer employ a version of the highly characterized poet-dreamer-narrator persona derived from the *Roman*; he also uses recognized European subgenres such as the bird debate. In the earliest of all his dream poems, *The Book of the Duchess*, he brings into play a 14th-century French genre whose invention is ascribed to its greatest practitioner, Machaut: the courtly *dits amoureux*.

Most of the *dits amoureux* known to Chaucer, by Machaut, Froissart, Grandson, and Deschamps, do not take the form of a dream, though their poets also wrote dream poems; Chaucer, in contrast, always combines the two. The French poems focus on the position of their poets, writing for a courtly audience and in a context of courtly social practice. For Chaucer, closely connected to the English court but not quite of it, this is a valuable mine of ambivalence, worked to the full in the Prologue to *The Legend of Good Women*.

In late-14th-century English writing there are other equally major uses of dream vision that achieve different effects in a less secular vein: the rhymed alliterative poem *Pearl* presents a vision of the New Jerusalem to the eyes of a dreamer who is represented not as any kind of poet but as the father of his dream guide, the dead Pearl-maiden. In the unrhymed alliterative poem *Winner and Waster* the dream facilitates political and social commentary, and in *The Parliament of the Three Ages* the courtly and secular are pulled into the perspective of apocalypse.

Piers Plowman is the greatest of all English works seeking to come to terms with the implications of dream vision for political and social commentary, literary creation, and religious truth. The work is a sequence of one dream after another, deadlock succeeding deadlock, and the tensions of Langland's long-drawn and compendious poem are palpable. The concerns and discursive milieu are far removed from Chaucer's, but the indeterminacy of authority is a shared anxiety that for Langland includes the moral and theological.

There are also less problematic uses of dream settings, in which the dream is a variant of the *chanson d'aventure*—a way of getting a poem started—or where the authority of dream is sought for simple political propaganda, as in Adam Davy's *Five Dreams about Edward II*.

Anglo-Norman writing offers several versions of visits to the otherworld (Legge, 1963: 274) and love allegories indebted to the *Roman de la Rose*; the most elaborate of the latter is *The Dream of the Castle of Love* (Legge, 1963: 337). Late in the period Anglo-Latin provides a return to full-throated prophetic vision in Gower's *Vox Clamantis*. Gower's major English vernacular poem, by contrast, the *Confessio Amantis*, is not formally a dream at all, though—like Dante's *Divine Comedy* or even Chaucer's *Canterbury Tales*—it owes an inestimable debt to the structures and conventions of dream vision and to the *Roman de la Rose* in particular.

However, it is Chaucer's witty and erudite combination of classical traditions, European literary precedent, and courtly discourse that dictates the course of English and Scots dream poetry through the 15th century into the 16th. Some of the best examples are Scots: several by Dunbar; Henryson's Prologue to his seventh *Fable*, an interview with Aesop; Douglas's Prologue to book 13 of his *Eneados*, an interview with Mapheus Vegius (author of the source for that book, a continuation of Virgil's *Aeneid*), and his *Palice of Honour*, no less than an ambitious effort to complete the unfinished *House of Fame* by way of Boethius, Scipio's Dream, and *Troilus*, concluding with a plea for the poet's preferment.

In England the Lydgatean view of Chaucer as master rhetorician leads to such rhetorical constructs as *The Temple of Glass* or to poems like William Neville's *The Castle of Pleasure*, which allies a response to Ovid's

Metamorphoses With, an art of love and a complete educational curriculum. Even more ambitious is Stephen Hawes's *The Pastime of Pleasure*, which contains such elements and more, culminating in the narrator's account of his own death and burial—in order that Hawes might end a veritable encyclopedia of dream vision with an account of heaven and hell and his coronation by Fame.

More Chaucerian in tone are two poems by Skelton: *The Bowge of Court*, with its nightmarish court peopled by conspiratorial abstractions, and *The Garland of Laurel*, in which the dream poem finally abandons modesty and turns into a wildly admiring vision of its own poet. Even as educational, theological, and social change are about to sideline dream vision, the vernacular dreamer at last reclaims the role of seer.

Dukes and Dukedoms

In most of the kingdoms that emerged from the ruins of the western Roman Empire the Latin word *dux* ("leader") survived as the title of an important royal officer, at first military but soon omnicompetent, governing a district comparable to one or two Roman provinces. In England *dux* was used between

ca. 950 and 1066 as one of several equivalents of the English titles *ealdorman* and *eorl*: a royal officer who governed a district analogous to a province. However, there was no vernacular derivative of *dux* until after the Norman Conquest, and between 1066 and 1337 it was applied only to the rulers of continental duchies.

In 1337 Edward III erected the lands, or *honor*, of the earldom of Cornwall into a duchy for his eldest son, Edward the Black Prince, already earl of Chester. This dukedom was entailed to descend automatically to the eldest sons of the kings successors, as it has to this day. Edwards elevation of his son to the still higher dignity of Prince of Wales (1343) cleared the way for the creation of a second duchy, and in 1351 Edward made his cousin Henry of Grosmont duke of Lancaster.

In both cases the ducal estate was scattered across several counties, quite distinct from the county named in the title. In 1362 Edward bestowed the then-vacant duchy of Lancaster on his son John of Gaunt, who had married Henry's heiress, and Edward simultaneously created a third ducal dignity, Clarence, for his son Lionel. In this case, and in all subsequent ones in England, the ducal dignity was not attached to a specific baronial estate; it was a dignity without any specific territorial jurisdiction, conveying high rank and honorific privilege but no guaranteed income or landed estate.

No further dukedoms were created until 1385, when Richard II made his father's two youngest brothers the dukes of York and Gloucester. In 1386 he created a sixth dukedom (of Ireland), for his favorite Robert de Vere, earl of Oxford, whom in 1385 he had made marquess of Dublin—the first dignity of that rank in his domain. This was the first duke not a member of the royal house. In 1397 (after Vere had been stripped of his new dignity) Richard conferred five new dukedoms: those of Hereford, Aumale, Surrey, Exeter, and Norfolk (the last three being given to men not of the royal house).

Henry IV and Henry V kept the title within the ranks of royal blood, and on the latter's death in 1422 there were six dukes. Henry VI (through his uncle, the regent Gloucester) revived the dukedom of Norfolk for John Mowbray but made no further dukes until 1443. The Exeter dukedom was then revived, and new ones of Somerset, Buckingham, Warwick, and Suffolk were created. No new dukedoms would be created until 1525. Forfeitures and death without male heirs kept the number low, and when Edward IV (duke of York) came to the throne in 1461, there were only three. He created eight more, but thereafter there were never more than eight dukes at any single time.

Altogether the sixteen dukedoms bestowed before the death of Henry VIII (1547) were held by some 51 men, of whom 26 were of the Plantagenet royal family, eight of the Tudors. Most dukedoms were conferred with an entailment to heirs male of the body of the grantee, though some of the earliest were for

life only. Even when formally heritable, ducal status was always precarious; of the sixteen dukedoms created only six (Cornwall, Lancaster, York, Buckingham, Norfolk, and Suffolk) passed even once before 1547 to the immediate heir of the original grantee; none passed to more than two heirs in unbroken succession.

Dukes were elevated by a charter or letters patent and invested, at first through the simple girding of a sword (as were earls), but from 1362 with the addition of a cap of estate and coronet comparable to that first used to create a prince in 1343.

Dunbar, William (ca. 1460-ca. 1513)

The most brilliant of the late-medieval Scottish poets. Dunbar graduated from St. Andrews University in 1479. For the next twenty years biographical evidence is lacking, but he may have been abroad; in 1500–01 he was in England. The most fully documented period in Dunbar's life is from 1500 to 1513; he then received a generous “pensioun,” or annual salary, as a “servitour” in the household of James IV. Yet the details of Dunbar's court career remain mysterious. This is one reason why it is difficult to establish the chronology of the 80 or so poems attributed to him. Although a chaplain, Dunbar never obtained high office in the church. Several poems voice hopes for a benefice, yet there is no evidence that he obtained even the humble “kirk scant coverit with hadder [heather]” mentioned in one of them. It is likely that Dunbar had some role in the royal secretariat, perhaps as a scribe or envoy. He is last

mentioned on 14 May 1513, but there is a gap in the records following the Battle of Flodden (September 1513), in which James IV died; Dunbar possibly survived into James V's reign, but there is no evidence that he did so.

The court provided Dunbar not only with a livelihood but also with his primary audience and much of his subject matter. Many of his poems are located "heir at hame" in Scotland; he writes of actual people, sometimes explicitly, sometimes obliquely, through the medium of dream, fable, and fantasy. He celebrates some of the great festive occasions in James IV's reign—*The Thrissill and the Rois* treats of the king's marriage to Margaret Tudor in 1503, and another poem describes the queen's visit to Aberdeen in 1511. He employs two favorite courtly modes, eulogy and elegy: greeting the distinguished knight Bernard Stewart in one piece and lamenting his death in another. But Dunbar also writes, more informally, about trivial events—what he sees, in his own words, "Daylie in court befor myn e [eye]." He devises comic squibs about fellow servitors, including fools and alchemists. Many poems were written, in the first instance, for a small group of people—king, queen, and courtiers, several of whom were, like Dunbar, both "clerkis" and poets. These poems are playful and recreative, intimate in tone and often colloquial.

Scholars have sought, with little success, to establish Dunbar's indebtedness to earlier writers. It is often easier to indicate the genres to which his poems belong than to pinpoint sources. Yet "Timor Mortis Conturbat Me" reveals keen interest in other Scottish poets, from the 14th century to his own time; and he was also familiar with alliterative works, such as Richard Holland's *Buke of the Howlat*. Dunbar seems aware of the Gaelic literary tradition but humorously dissociates himself from it in *The Flyting of Dunbar and Kennedy*. Ignoring the political boundaries between England and Scotland, Dunbar embraces their shared language and poetic traditions. At the close of *The Goldyn Targe* he speaks of "oure Inglisch," and pays homage to the high style of poetry associated with Chaucer and Lydgate; he himself writes in this tradition effectively.

Yet Dunbar was also familiar with less sophisticated literary forms—drinking songs, bawdy love poems, and the ballads he mentions in "Schir Thomas Norny." Casual, throwaway remarks in this and other poems provide our chief clues both to Dunbar's literary tastes and his view of himself as a poet. He calls himself a "makar" and his poetry "making." Such terms lay stress on the poet as craftsman and the poem as artifact; most critics see Dunbar in this light, praising him less for the originality of his ideas than for his verbal "energy" and metrical virtuosity.

Dunbar's finest poems almost all contain some strain of comedy. His range of tone is wide: occasionally flippant and bantering but more often sardonic

and derisive. He does not merely mock deviants and outsiders, traditional comic butts like the friars, or those low in the social hierarchy; he makes fun of himself and can be disrespectful to the king. Dunbar delights in exploiting areas of social tension, between Lowlanders and Highlanders, clerics and laypeople, or men and women. Certain modes seem particularly congenial. He is a master of invective and grotesque portraiture and also excels at parody and burlesque. Several poems are mock-chivalric, and two, “The Dregy” and “The Testament of Andro Kennedy,” draw upon the tradition of medieval Latin parody. Dunbar is a witty poet, but his wit is contextual, displayed less in neat epigrams than in topical allusions, puns, and a pervasive irony, particularly evident in his ambitious poem the *Tretis of the Tua Mariit Wemen and the Wedo*. A cluster of dream poems displays a strikingly black “eldritch” comedy.

Dunbar also wrote fine hymnlike religious poems and other wholly serious verse, some of which is didactic in a manner uncongenial to modern readers; yet such pieces were popular with contemporaries. Their style is plain, and their tone impersonal and hortatory. Many could have been written by any competent poet of the time; indeed several attributed to Dunbar in one manuscript are elsewhere assigned to another poet or anonymous. This uncertainty as to authorship is symptomatic of their extreme conventionality. Yet some of Dunbar’s moral poems, which undoubtedly spring from this same tradition, have far greater individuality. Two of the finest, “Timor Mortis Conturbat Me” and “In to thir Dirk and Drublie Dayis” (by later editors called “The Lament for the Makaris” and “Meditatioun in Wyntir”), give poignant expression to ancient commonplaces about death and mutability.

Dunbar’s poems are so varied that critics find it difficult to form a coherent image of their protean author. Some seek to reconcile the disparate elements in his poetry through an underlying “morality”; others stress rather the generic nature of his poems. The exact degree of self-expression in Dunbar remains difficult to assess but seems to fluctuate. The “I”-figure of some poems is largely a narrative persona, and in others a spokesman for orthodox morality; but in some, particularly the petitionary poems, we hear an intimate and private-sounding voice.

Duns Scotus, John (ca. 1266–1308)

Franciscan philosopher and theologian of Scottish origin; probably born in the village of Duns, county Berwick. Duns Scotus entered the Franciscan order and was ordained priest in 1291. He studied and lectured at Oxford and Paris, where he developed his philosophical and theological ideas. Caught up in the political difficulties between Pope Boniface VIII and Philip IV of France, propapal Duns Scotus was forced by royal anger to interrupt his studies and leave Paris. Returning in 1304, he received the degree of master in theology, occupied the Franciscan chair at the University of Paris, and distinguished himself by his ardent support of the doctrine of the Immaculate Conception of the Virgin Mary. His last year was spent lecturing in Cologne; his life ended there in 1308.

Owing to his sudden death, his works were completed by his students; it is

difficult to separate the spurious from the authentic. The most important source for his ideas is the *Opus Oxoniense (Ordinatio)*, a commentary on Peter Lombard's *Sentences*. Other important works include the *Reportata Parisiensia*, a second commentary on the *Sentences*; *De primo principio*, which reveals Duns Scotus's mystical side; and several commentaries on the work of Aristotle.

Duns Scotus attempted to develop a critical synthesis of the major philosophical schools of his day, the Augustinian and the Thomist-Aristotelian. He developed a complex proof for the existence of God, stressed the primacy of will over intellect, and argued that human reason can attain truth without divine illumination. He stressed the importance of the individual essence, *haecceitas*, which makes each being unique. Fearful of oversimplification, Duns Scotus expressed his ideas through a carefully defined and redefined system of argumentation. The convolutions of his thought inspired later humanists to derive the insulting term "dunce" from his name; his complex intricacies earned him the 14th-century designation "doctor subtilis."

Dunstable, John (ca. 1395–1453)

Composer, mathematician, and astronomer. He is the author of over 70 surviving works, including music for masses, offices, Marian devotions, isorhythmic motets, and secular songs. Dunstable (or Dunstaple) stands at the head of an influential group of English composers whose music, beginning in the later 1420s and 1430s, circulated on the Continent, where it had an immense stylistic impact. Fifteenth-century musical commentators recognized Dunstable's importance, and he held a high posthumous reputation for many subsequent generations.

Of Dunstable's biography we know little. The paucity of documentation seems to be due to a career that kept him out of the records of the court, and there is no evidence of a direct association with any cathedral or monastic establishment or the Chapel Royal. He seems to have begun composing around 1415, but he is not represented in the first layer of the Old Hall Manuscript, which was copied by 1421. A few long-known pieces of evidence, along with important recent archival discoveries, suggest that Dunstable was in service to John duke of Bedford before 1427; moved into the household of the duke's stepmother, the dowager Queen Joan, from 1427 until her death in 1437; and at that point entered the *familia* (household) of her stepson and John's brother, Humphrey duke of Gloucester. Dunstable's relationship with Gloucester is described as that of "serviteur et familier domestique," an appellation that probably can be extended to his previous relationships with John and Joan, suggesting a high-ranking role in administrative service while not, significantly, a member of the household chapel. Though Dunstable's music is preserved mainly in continental sources, it now appears that his personal presence in France was limited and intermittent. Thus he is not likely to be the central agent in the transmission of English music across the Channel that he was once thought to be.

The scale and nature of the rewards Dunstable received from his patrons indicate the high regard they held for him. He enjoyed lavish gifts, landed income at a high level, and a large annuity from Queen Joan; and he held a lordship, estates, and fiefs in Normandy under the patronage of Gloucester in the years 1437–41. In England Dunstable owned property in Cambridgeshire, Essex, and London. Documents style him esquire or armiger, suggesting he was a wealthy landholder of an order of society just below the knightly class. In London he held rents in the parish of St. Stephen Walbroke, in which church he was buried, outlived by his wife and other descendants. The church and his monument do not survive, but his epitaph there was recorded. A second epitaph, by John of Wheathampstead, abbot of St. Albans, is also known.

Dunstable's further ties to St. Albans include two motets, one on St. Alban (the text is possibly by Wheathampstead) and another on St. Germanus. The composer's link to the abbey undoubtedly came through two of his employers, Queen Joan and Gloucester, who were among its principal aristocratic benefactors (Gloucester was buried there).

Dunstable's music is the preeminent exemplification of the influential "nouvelle pratique" that one continental observer of around 1440 called "la contenance Angloise." Chief features of this style include the predominance of triple meter in flowing rhythms of quarter notes and eighth notes with gentle syncopations and hemiola, smooth triadic melodies with distinctive cadential turns of phrase, and a uniformly consonant harmonic-contrapuntal language rich with the warm sound of imperfect consonances—thirds, sixths, and tenths.

Dunstable's eleven isorhythmic motets are among the last in an English and continental tradition stretching back to the middle of the 14th century. Polytextual, based on plainsong tenors, and written for three or four voices, they are almost all variations upon a "classical" pattern with tripartite proportional diminution. Sustaining a particularly English tradition, their texts are all sacred, with six dedicated to saints (John the Baptist, Catherine, Alban, Germanus, Michael, Anne), three to the Virgin Mary, and two for Whitsunday. Their origins are likely to have been ceremonial rather than strictly liturgical. From the testimony of a chronicler it appears that Dunstable's motet on John the Baptist, *Preco preheminentie / Precursor premittitur* with tenor *Inter natos* (perhaps one of his earliest compositions), was sung before Henry V and Emperor Sigismund in Canterbury Cathedral on 21 August 1416 to celebrate victory at the siege of Harfleur and the Battle of the Seine.

For settings of liturgical texts outside the mass Ordinary Dunstable principally draws upon processional and office antiphons for Mary, constructing compositions of roughly the same dimensions as an isorhythmic motet or mass movement that are destined for performance at Marian devotions. These pieces are nearly all for three voices, occasionally reducing to two, with a songlike top part over a supporting tenor and contratenor; some are based on chant but the majority are freely composed. Though neither polytextual nor isorhythmic, they were apparently regarded as a species of motet by some continental scribes, and they are called motets by many modern authorities. It has been shown recently that careful mathematical planning governs their proportions.

Most of Dunstable's compositions for the Ordinary of the mass (Kyrie, Gloria, Credo, Sanctus, Agnus) are single isolated movements; all but three of these pieces are freely composed, without reference to plainsong. In the 1420s and 1430s, however, Dunstable and his English contemporaries, including Leonel Power and John Benet, pioneered the musical integration of a complete

five-movement mass cycle, achieving unification by using the same “alien” *cantus firmus* as the tenor in all movements. These early English cyclic tenor masses were based on sacred plainsongs (antiphons and responds); Dunstables cycles include *Jesu Christi fili Dei*, *Da gaudiorum premia*, *Rex seculorum* (also ascribed to Leonel), and a *Missa “sine nomine”* (also ascribed to Leonel and Benet). It may be the case that a number of anonymous cycles of the 1440s are also of Dunstables authorship. Continental composers, such as Guillaume Dufay, began to imitate these English cycles around 1450.

Few secular songs survive by members of Dunstable’s generation. Sources credit him with just three, two of which are plausibly attributed elsewhere to a younger contemporary, John Bedingham, leaving only a French-texted rondeau, *Puisque m’amour*, to represent the courtly side of his output. However, Dunstable’s lifetime saw the great flowering of the polyphonic carol, and amid this anonymous repertoire are likely to be works by the great English master.

Dunstan of Canterbury (ca. 910–988)

Monk and archbishop of Canterbury. The son of a Somerset noble, he was educated at Glastonbury Abbey, probably by Irish monks. Related to the royal line with several kinsmen who held episcopal sees, in his youth he was often at the court of King Æthelstan. The enmity of other young nobles, however, led to his expulsion. He stayed for a period with his uncle Ælfheah, bishop of Winchester, under whose influence and in the wake of a serious illness he committed himself to the monastic life. Retiring to a hermitage near Glastonbury, he studied scriptures and served as a scribe, illuminator, composer, and metalworker.

Recalled to court by Æthelstan's brother and successor Edmund (939–46), he became one of his counselors, only to be again banished. Soon afterward Edmund, nearly killed in a riding accident, concluded that he had wronged Dunstan; he named him abbot of Glastonbury and promised to endow that institution as a regular monastery. Under Dunstan's guidance a monastery was built with an organized community of monks adhering to the Benedictine Rule. Its foundation is seen as marking a long-enduring revival of English monasticism after several generations of decay.

Under Edmund's successor Eadred (946–55) Dunstan and his monastery were the recipients of even greater favors, but his fortunes waned with the accession of Eadwig (955–59). In 956, having angered an influential woman at court, he was forced into exile in Flanders. Restored by Edgar (957–75), he became the king's chief adviser and treasurer. Named bishop of Worcester (957) and London (959), in 960 he became archbishop of Canterbury. On Edgar's death he supported the royal claim of Edward the Martyr and, after Edwards murder in 979, the claim of Æthelred II. Dunstans final years were spent at Canterbury, devoted to prayer, study, and teaching. He died on 19 May 988, the "patron and father of the monks of medieval England."

Durham

The latest known OE poem, surviving in three versions: CUL Ff.i.27, page 202; Hickes's *Thesaurus* (1705) 1.178–9, from BL Cotton Vitellius D.xx, fol. 20v, lost in the 1731 fire; and Stanford University Libraries Mise 010, pages 1a–d, a 17th-century transcription by Franciscus Junius from an unknown manuscript. The 21-line poem, dated ca. 1104–09, praises three aspects of the city of Durham in northeast England. Lines 1–8 describe the beautiful landscape, with the River Wear and bountiful fishing and hunting. Lines 9–17 list famous people buried in the cathedral: Cuthbert, King Oswald (only his head), Bishop Aidan, kings Eadberht and Eadfrith, Bishop Æthelwold, the "breoma bocera" (famous scholar) Bede, and Bishop Boisil. Lines 18–21 mention the countless relics housed there and the miracles they perform. Scholars assign the poem to the *encomium urbis* (praise of a city) subgenre.

Durham Cathedral

Commenced in 1093 by Bishop William of St. Calais, Durham Cathedral (figs. 52–53) stands with the castle on a peninsula high above the River Wear as a proud symbol of Norman achievement. The eastern arm was finished for the translation of St. Cuthbert in 1104, and by 1133 the church was completed, with the exception of the superstructure of the twin western towers. These towers were probably finished by Bishop Hugh le Puiset (1153–95), who also added the galilee, or entrance chamber, at the west end. After 1242 the presbytery high vault was rebuilt and the Romanesque apses were replaced with the Chapel of the Altars.

The rib vaults throughout the church and the pointed transverse arches in the nave high vault have often led to the classification of Durham Cathedral as a proto-Gothic structure, and in this regard the quadrant arches in the nave galleries have even been construed as embryonic flying buttresses. However, the quadrant arches were erected in connection with a transverse gabled roof in each bay, the outlines of which are still visible on the north-wall exterior. The rib vaults and the, pointed arches are better understood in the context of English architecture around 1100.

Durham Cathedral was conceived in rivalry with the other great churches in Europe. The aim of the patron seems to have been to create the finest church in Christendom. Its huge scale vies, for example, with St. Albans (1077) and Winchester (1079) and recalls the great early Christian basilicas of Rome. The association between Durham and Rome is specific. The overall length of the church is taken from Old St. Peter's, and the incised spirals on the columnar piers of the presbytery and transepts are iconographically related to the Solomonic columns around St. Peter's shrine. The "furniture" of St. Peter's shrine was thereby integrated into the architectural setting for St. Cuthbert.

The analogy may be taken further, for the quadripartite ribs of the Durham vaults suggest an association with the open ribs of the canopy above St. Peter's shrine. Also, if the staircases that flanked the apse of Old St. Peter's were

carried up as towers, they explain the towers above the aisle apses, and flanking the main apse, at Durham. Eastern towers may also relate to the imperial cathedral of Speyer and possibly to Winchester and St. Albans. These two English buildings were important for Durham. At St. Albans the four-bay presbytery had a high groin vault, a precursor of the high rib vault at Durham, while the St. Albans transept-angle turrets presage those at Durham. Winchester also had a four-bay presbytery, albeit unvaulted, but, like Durham, with alternating compound and columnar piers in the main arcade as part of a full three-story elevation. Furthermore the aisles at Winchester are enriched with a round-headed dado arcade and stepped shafted responds for the groin vaults.

Durham matched or surpassed these features: linear groins evolved into molded ribs, plain dado arcades became molded and intersected, and plain main arcade and gallery arches metamorphosed into bold plastic forms. The intersecting arcades may reflect Anglo-Saxon or even Islamic sources, while the elaborate arch moldings isolated at the crossing of St. Étienne at Caen are applied throughout Durham. Similarly the exterior dado arcade on the apse at St. Nicholas at Caen becomes ubiquitous at Durham. The commodious width of the Durham staircases is paralleled in castles, a military association that suggests that the cathedral was conceived as the fortified heavenly counterpart to the secular castle.

The high vaults in the presbytery and north transept were completed as intended but a change in plan introduced a wood roof in the south transept. This was removed and the present vault was constructed at the same time as the plan for a wood roof in the nave was changed to a high vault.

The first campaign stopped with the completion of two bays of the main arcade and one bay of the gallery on both sides of the nave. In the second campaign (ca. 1115) chevron ornament is introduced, and pointed transverse arches are used in the nave high vault. These facilitate level crowns in the vaults without the stilting necessary with round-headed transverse arches. The north and south doorway are unusual in that their inner faces are richly carved. The exterior of the north doorway was heavily reworked in 1778; its original two-story form is best reflected in the north-transept portal of Kelso Abbey (Roxboroughshire).

Durham Cathedral had an immediate influence on British architecture, from Waltham Abbey in the south to Kirkwall Cathedral on Orkney. It also set the standard for elaborate linear articulation that was to remain an essential feature throughout English medieval architecture.

Durham Choir Screen Reliefs

Two sandstone panels, each with two scenes from the life of Christ carved in deep relief (ca. 1155), were discovered reused as building material at Durham

Cathedral. Two of the scenes show episodes from the Transfiguration, the other two show Christ's appearance to Mary Magdalene and Christ's appearance to the two Marys. The faces of all the figures have been destroyed. In his 1934 volume, *English Romanesque Architecture after the Conquest*, Clapham identified the reliefs as part of the original screen separating the choir from the nave. The screen is described in the 1593 *Rites of Durham* as having been decorated with gilded reliefs showing the Passion of Christ, and images of the twelve apostles, sixteen kings, and sixteen bishops, all surmounted by a crucifix. It seems to have been created before ca. 1155 by sculptors in the employ of Hugh le Puiset, the last of the bishops to be included in its decoration.

Fig. 53. Durham Cathedral, plan of Romanesque church. After G. Webb (1956). Reprinted by permission of Yale University Press.

The two sets of scenes are treated differently. The Transfiguration is set against a plain background, while stylized trees punctuate the backgrounds of Christ's appearance to the Marys. Additional details, such as the damp-fold drapery with beaded hems and borders and the differing treatment of Christ's halo (cruciform in the scenes of Christ's appearance, plain in the scenes of the Transfiguration), suggest the work of two different artists. Both artists, however, were capable of depicting the forms of the bodies and their movement beneath the clinging draperies, as well as a lively sense of narrative through the expressive gestures and poses of the figures.

Eadwine and Canterbury/Paris Psalters

The Eadwine Psalter (Cambridge, Trinity College R. 17.1; [fig. 54](#)) and Canterbury/Paris Psalter (Paris, BN lat. 8846; [fig. 55](#)) were produced in Canterbury in the 1150s and 1180s, respectively. Along with the Harley Psalter (BL Harley 603; [fig. 71](#): see HARLEY PSALTER) of ca. 1000, they are descendants of the Utrecht Psalter (Utrecht, Rijksuniversiteit 32) of 816–35. The relationship among the three English manuscripts is problematic, as each shows iconographic innovations, indicating that they are not mere slavish copies, and each exhibits similarities to and differences from the others. While the Harley Psalter is thought to have been made directly from Utrecht, the Eadwine and Paris psalters are considered by many to be copies of a lost intermediary manuscript, itself copied directly from Utrecht. It has recently been suggested, however, that Eadwine may actually have been one of the sources for Paris (Gibson et al., 1992:26).

The Eadwine Psalter stands out among the Utrecht family of manuscripts both for the completeness of its illustrated cycle and for its scholarly assemblage of texts: the *Hebraicum*, *Romanum*, and *Gallicanum* run in three neat columns throughout the manuscript, accompanied by interlinear glosses in Anglo-Norman, Anglo-Saxon, and Latin, respectively. The decoration consists of 166 tinted outline drawings, over 500 fully painted initials highlighted with gold and silver, and minor initials in gold and silver. Originally the psalter was preceded by a series of pages with fully painted narrative scenes from the Old and New Testaments (over 130 individual subjects). This set of introductory pages, possibly an innovation of the Eadwine artists, is now divided between New York (Pierpont Morgan Library Morgan 724, 521) and London (BL Add. 37472 [1]; Victoria and Albert Museum 661). Its purpose may have been to illustrate the failure of the Old Law and the promise of the New (Gibson et al., 1992: 42). Around 1170 a portrait of the scribe Eadwine (fol. 283v), a plan of Christ Church, Canterbury, with the waterworks installed by Prior Wibert (fol. 284v-285), and a fragmentary second plan (fol. 286) were added to the manuscript.

Fig. 54. Eadwine Psalter (Cambridge, Trinity College R17.1), fol. 283v. Portrait of the scribe Eadwine. Courtesy of the Master and Fellows of Trinity College, Cambridge.

The portrait of Eadwine is executed in an elegant calligraphic derivative of the damp-fold style, and accompanied by a gloss in the form of a dialogue between scribe and letter that perfectly exemplifies the textuality of the community in and for which the manuscript was produced. It reads in part:

The prince of scribes am I: neither my praises nor my fame shall ever die; shout out, oh my letter who I may be.

By its fame your script proclaims you, Eadwine, whom the painted figure represents, alive through the ages, whose genius the beauty of this book demonstrates....

While the manuscript shows the hands of a group of scribes and artists (one primary master, four secondary artists), Eadwine is thought to have been responsible for overseeing its production.

Fig. 55. Canterbury/Paris Psalter (Paris, BN lat. 8846), fol. 21. Psalm 12. © Bibliothèque Nationale de France Paris, used by permission.

The Paris Psalter is the last and most lavish of the English descendants of Utrecht. It is complete only to verse 6 of Psalm 96. The manuscript opens with eight pages, each divided into twelve square compartments (eighteen medallions on fol. 4) with 46 Old Testament and 39 New Testament narrative scenes. There are miniatures illustrating each of the psalms, and the first verse of each psalm is decorated with an elaborate initial. The textual arrangement of Paris is close to that of Eadwine: the *Hebraicum*, *Romanum*, and *Gallicanum* run parallel to each other throughout, accompanied by interlinear glosses in French, Anglo-Saxon (a partial gloss), and Latin. The miniatures are in a fine byzantinizing style with deep rich colors and dark outlines. They differ most markedly from Eadwine in that they are fully painted and set against highly polished gold backgrounds. The number of figures within the scenes has been reduced, and the figures themselves show a new monumentality, refinement of pose and gesture, and strong sense of modeling.

They also inhabit larger, more detailed architectural settings. Graceful unfurled scrolls for text inscriptions replace the more informal arrangement of inscription and image that characterizes Eadwine. Two artists whose styles are quite similar completed fols. 5v–70, 75–78v, 84, and 88v–92; the rest of the manuscript was decorated in the 14th century by a Catalan artist.

Earls and Earldoms

The oldest of the nobiliary dignities in England, associated since about 1290 mainly with the parliamentary peerage. In its earliest form it was associated with the government of a shire (from the mid-8th century). The history of the title falls into four periods.

1. Ca. 750–1016: The dignitary was designated in the vernacular as *ealdormann* or *aldormann* (“man standing in the place of a chief”).
2. Ca. 1016–66: After the Danish conquest *eorl* replaced *ealdormann*. The Danish cognate *jarl* (whence “earl”) had a comparable meaning and

presumably seemed more familiar to Cnut in designating his highest-ranking lieutenants.

3. 1066-ca. 1400: Anglo-Norman usage leaned toward *comes*, and the dignity and jurisdiction of the dignity carried the dual sense of “countship” and “county.”
4. 1400 to present: When the court returned to English usage, “earl” replaced the French *counte* (though an earl’s wife is still styled a “countess”).

The earliest ealdormen seem to have been created by the kings of Wessex on the model of the Frankish counts and were appointed to govern single districts or “shires.” They governed the shire in the king’s name, commanded the *fyrð* (or militia), and presided, with the local bishop, over the shire court. For this each ealdorman received one-third of the profits of justice, called the “third penny.” Though ealdormen were usually of leading families, they seem to have held office at the king’s pleasure and before the 11th century probably did not acquire hereditary rights to office or to land in their shire.

Between 925 and the Norman Conquest larger blocks of territory—often contiguous shires—were placed under the jurisdiction of individual ealdormen, or earls, and in the 11th century the four major earls governed blocks of territory corresponding roughly to the old Anglo-Saxon kingdoms: Wessex, Mercia, East Anglia, and Northumbria. After Cnut’s conquest the dignity of *eorl* became the prerogative of a few great patrilineages, and they furnished the high nobles with whom Edward the Confessor was confronted.

Under William I the dignity of earl (effectively renamed “count,” just as the shire was renamed “county”) was transformed from a regular appointive office into a feudal, and therefore hereditary, position. The model for this was Normandy, and the earls (or counts) were mostly placed in control of key border regions, while sheriffs were responsible for the more central counties. The lands given to the earl or count were apt to be scattered within the territory under his nominal rule. Though the *honor*, or barony, of the earldom might be partible among a counts heirs, the dignity was indivisible, and, in the failure of a male heir, the king’s choice for its descent among co-heirs or the consort of an heiress determined the future of the dignity.

From the time of William II most earls or counts were devoid of public authority or a function within the county. The number of such men was greatly increased in the Anarchy, as both sides sought to win the support of the great barons, and when Henry II came to the throne there were 23 earls in England. Thereafter the numbers were kept strictly in check, and between 1227 and 1307 five of the eight men promoted afresh to this rank were kings’ sons.

As parliament became a regular institution in the 14th century, the earls

emerged as major barons in what became the House of Lords (though eventually, as new dignities were created and bestowed, they stood below princes, dukes, and marquesses). Edward II created six new earldoms, Edward III seventeen (with six coming on a single day in 1337), Richard II fifteen. When Edward IV came to the throne (1461), there were 24 earls. Six Lancastrians were then deprived of their titles, but new Yorkist creations brought the number back into the low twenties, where it remained until the accession of Henry VII.

From the reign of Stephen counts or earls were elevated by charter or letters patent and were invested in a public ceremony that always included girding them with the sword—whence the expression “belted earl.”

Earls Barton Tower

Fig. 56. Earls Barton, Northamptonshire, tower from the southwest. Courtesy of A.J. Hawkes.

This massive 24-foot-square late Anglo-Saxon, 950–1050 tower ([fig. 56](#)), on high ground near a mound and ditch above the River Nene in

Northamptonshire, once formed the nave of a church. Vertical pilaster strips with round- and gable headed arcading cover the structure, prompting debate over the extent to which carpentry influenced masonry here. Considered one of the most interesting survivals of late Anglo-Saxon architecture, Earls Barton graced a British stamp in 1972.

In 1979–80 a small excavation established from cemetery evidence that several churches probably preceded the 60-foot tower. The tower also postdated the mound and ditch to its northwest, suggesting that it could perhaps have functioned as part of a legal or defensive construction, thus having both secular and religious functions. The scarcity of openings on the north protects the tower should anyone take the mound.

Rising from a plinth and divided by stringcourses, the four stages of the tower decrease in size toward the belfry. The tall first stage has a double, round-headed window on the south just below the stringcourse, with transennae (stone screens) cut by crosses; crosses are carved into the basket arches over each opening, and there is also a cross within a circle on a slab to the west. Such elaboration emphasizes the use of the lowest level as a nave; the effect of light shining through the transennae crosses would have been striking, given how elevated the tower is in the landscape. On the west a large doorway with arcading incised on the imposts may once have had a wooden porch or roof, as the pilaster strips stop with corbels just above the doorway. A blocked opening similar to that on the south appears above a Norman window.

The next two stages have pilasters, round and gabled arcading, and doorways resting on the stringcourses. The external upper doorways could have been used for such purposes as relic display and preaching to crowds too large for the church or perhaps to groups assembled on the mound. The belfry has gabled arcading, with five round-headed openings on all sides, separated by stone slabs with balusters at their outer faces. The east face differs slightly and has two circular holes cut over the northernmost openings.

Older accounts of the tower described it as showing a combination of ambition and incompetence, as several pilasters fit badly and destroy a regular pattern, and the north face is one foot off square. Pilaster strips remain a debated architectural technique, claimed at various times as Roman, German, and English, argued for as decorative or functional, and considered of uncertain origin. Their resemblance to timber framing prompts debate on the relevance of carpentry to the function and origin of the pilasters and arcading, but Taylor noted that “almost without exception” churches with tall pilaster strips have walls of fairly small rubble; the pilasters bind deeply into the wall for anchoring. Rodwell’s recent work on carpentry joints, however, argues that pieces were prefabricated at Earls Barton according to carpentry methods, then incorrectly assembled: “The design of its prototype was wholly for timber,

where prefabricated framing would be brought onto site ready for erection” (174). The presumption would be that here carpenters were pressed into service for an impressive project to which their skills were not wholly suited. Taylor noted 24 churches with pilaster work in the Midlands and southwest.

“East Anglian School” of Illumination

The term “East Anglian School” was first used by Sir Sydney Cockerell in 1907 to describe certain manuscripts produced in England in approximately the first third of the 14th century. The books he placed in this category had to meet certain criteria of script and decoration. Most, but by no means all, were connected by provenance or destination to the geographical region of East Anglia (Norfolk, Suffolk, Essex, and parts of Lincolnshire). Cockerell grouped some eighteen manuscripts under this heading, at least five of which (the Rutland, Alfonso, and Isabella psalters, a Petrus Comestor, and the Grey-Fitzpayn Hours) are now considered inappropriate for this classification. (Shelf marks for manuscripts discussed here and below appear at the end of the entry

in the order in which they are discussed.)

In his chapter entitled “The East Anglian School” (1928) Millar included twelve of the books listed by Cockerell (the Gorleston, Barlow, Howard, Ormesby, Ramsey, Douai, St. Omer, and Luttrell psalters, the Peterborough Psalter in Brussels, the Stowe Breviary, the Tiptoft Missal, and the Emmanuel *Moralia in Job*) and added a further three (the Bromholm and All Souls psalters and the second, later portion, of the De Lisle Psalter—the last no longer considered to be an East Anglian product). For both Cockerell and Millar manuscripts of this “school” are broadly linked by an “extraordinary richness and vigour of decoration” (Millar). The borders, often large in scale and bold in execution, are the principal vehicles of decoration; they contain a wealth of plant forms, interspersed with a variety of grotesques (also called hybrids or drolleries), as well as heraldic shields.

It is the manuscripts listed in Millars chapter comprising the Queen Mary and Tickhill Psalter groups, some of which he sees as having a bearing on the East Anglian books, that may have prompted Rickert (1954 and 1965) to include them erroneously under the heading “East Anglian School.” Millar acknowledged the enigmatic position occupied by one such manuscript, the Peterborough Psalter and Bestiary, which has a Peterborough destination but contains illumination in the Queen Mary style.

With Rickert’s contribution the term “East Anglian” was rapidly becoming a convenient label for any richly illuminated manuscript produced in England in the first 40 years of the 14th century. As further manuscripts have come to light, it has long been realized that the “East Anglian School” is too simplistic a term and requires redefinition. An important step in that direction took place in 1972 with an exhibition held at Norwich. Here Morgan validated East Anglia as a major region of artistic production between about 1300 and 1340, with the ecclesiastical centers at Peterborough (for manuscripts associated with the Peterborough Psalter in Brussels) and Norwich (for manuscripts associated with the Gorleston and Ormesby psalters) as likely locations for this activity, but with the proviso that the artists were probably laymen who traveled around the region or who worked in purely secular shops, thus reinforcing Cockerells view (1907). Included in this exhibition, however, were certain books in the Queen Mary style that are East Anglian in neither provenance nor decoration, having been produced in London: these are the *Somme le roi*, the Chertsey Breviary, and Bodl. Douce 79.

A recent discussion of the East Anglian question is that by Sandler (1986). Under the heading “East Anglian Groups” she outlines six subsections: the Fenland, Ormesby, Gorleston, Stowe, Barlow, and Italianate groups. She discards some court style and other manuscripts from Cockerells list, retaining twelve of his original eighteen, while adding a further ten. One, the Fenland

group (principally the Peterborough Psalter in Brussels, the Ramsey Psalter, and the Gough leaves), comprises perhaps the earliest manuscripts that can be deemed East Anglian by virtue of Sandler's geographical definition (Norfolk, Suffolk, parts of Cambridgeshire, the Isle of Ely, and the Northamptonshire Fenlands). It is this group that raises the question of the origins of the style that may lie ultimately in certain London-produced manuscripts of the late 13th century.

It was Wormald's contention (1949) that the sources of the East Anglian style lay at the court, and the apparently earliest hands in the psalter in Brussels relate stylistically and formally to the opening hand of the Alfonso Psalter. The strong monastic associations of the Peterborough Psalter group's works pose the question of whether the illuminators were based in the Peterborough area or were itinerant, traveling perhaps from a base in Norwich, London, or possibly Cambridge: there is not sufficient evidence to postulate a center with certainty. The period of activity of this group is approximately 1300 to 1325.

Since her 1974 study Sandler has chronologically separated the stylistically related Barlow Psalter and two Apocalypses from the other products of the Peterborough group, seeing them as a subgroup of the 1320s, but Bennett (1982) has put forward convincing evidence for a date before 1321 for the Barlow Psalter. This in turn suggests a more cohesive group whose period of production spans 25 years from ca. 1300 to 1325 without the break of approximately ten years as proposed by Sandler.

Fig. 57. The Gorleston Psalter (BL Add. 49622), fol. 126. Psalm 97. Reproduced by permission of the British Library, London.

With the group of manuscripts stylistically related to the principal hand in

the famous Ormesby Psalter (fig. 102: see ORMESBY PSALTER) there is firmer evidence as to workshop location, with strong Norwich associations pointing to an origin in that city and a period of production spanning ca. 1310 to 1320. Produced at about the same time are the manuscripts associated with the Gorleston Psalter (fig. 57), principally the Howard Psalter, the Longleat Breviary, and the Harnhulle Psalter-Hours; it is less easy to determine where these artists were working. Owing to the Howard Psalter artist's association with an illuminator of the Queen Mary group (the Subsidiary Queen Mary Artist), and the links of both with East Anglian patrons, there may be a case for postulating that these two illuminators were engaged in itinerant work in the region, possibly with a base at one of the centers outlined above (it is now accepted that London was the location for the central Queen Mary activity). Sandler separates the Stowe group, comprising the Escorial and Schloss Herdringen psalters and the Tiptoft Missal (fig. 92: see MANUSCRIPT Illumination, GOTHIC), from the Gorleston group, presumably on grounds of dating (the 1320s). There appears, however, to be a direct stylistic development from one group to the other, the Stowe Breviary seeming to be a late work by one of the Gorleston Psalter artists. The East Anglian location of this workshop is as yet uncertain, but it may again raise the question of peripatetic workshop practices. The manuscripts of this group are conspicuous for their lack of the marginal grotesques normally associated with the products of the region.

A further distinctive style is associated with innovative italianate techniques and compositions, as found in the Douai Psalter and related works (the additions in the Gorleston and Ormesby Psalters, the Castle Acre Psalter, and the 14th-century portion of the St. Omer Psalter). The traditional dating for this material, based on the historical notes in the Douai Psalter, is ca. 1322–25/30, but more recently an argument for ca. 1330 at the earliest has been forwarded. This material was probably produced in Norwich ca. 1330–40. Within this group Sandler places certain other manuscripts that show italianisms but that seem to constitute further subgroups—the one associated with the enigmatic Luttrell Psalter, another with Bodl. Douce 131 and related manuscripts (principally the Brescia Psalter, the Psalter of Simon de Montacute, the Astor Psalter-Hours, and the first campaign in the Vienna Bohun Psalter). It is with this group that Cambridge emerges as a likely center of artistic activity from ca. 1340 until (and possibly just beyond) the Black Death of 1348–49. Moreover strands of circumstantial evidence link the Fitzwarin Psalter Artist to this area toward the end of his career (ca. 1348/49). A probable focusing of activity in the 1340s on this center, which was badly affected by the plague, may account for the extermination of a number of illuminators. The main Bohun workshop, which established itself at Pleshey Castle in Essex ca. 1350–55, in a sense perpetuated the East Anglian tradition

until London reestablished itself as an important center in the early 1370s.

A redefinition of the term "East Anglian School" in no way diminishes the importance of this region as a focus of manuscript production during the first half of the 14th century. A single school it clearly was not, however. With few exceptions it is still not possible to locate the precise areas of this artistic activity, a question that will be exceedingly difficult to resolve until more is discovered about the working methods of these illuminators, whether from existing documents or from further close analysis of the manuscripts themselves.

Saxon

The chronological framework for “early” Anglo-Saxon architecture is not very secure. Brown, Taylor, and Cherry would see it as ca. A.D. 600–800, with an “obscure,” intermediate period ca. A.D. 800–975, when the “late” period begins. Others, like Fernie, extend “early” to the period of the Viking invasions and settlements in the last quarter of the 9th century, when “late” begins.

Modern excavations of churches and other buildings have revealed how many pre-Conquest phases of development a building can have and how difficult they are to date. Architectural historians are still a long way from the definition of national and regional styles and are only just beginning to appreciate the complexities of timber architecture, with which both secular and many church buildings were constructed; the following discussion will therefore be confined to stone, which effectively means ecclesiastical, architecture.

Distinctive Anglo-Saxon architectural styles were first recognized in relation to late Saxon features. This is not surprising, since if there is one characteristic of early Anglo-Saxon architecture it is its variety, reflecting no doubt the individual enterprise of churchmen and other patrons.

The traditionally distinctive styles of Kent and Northumbria are considered separately. In scale most 7th- to 8th-century buildings are small, rarely more than 85 feet long, and 18 feet wide, although on monastic sites there are often several churches on the same axis. Scale increased and plans became more complex after ca. 800, but most early types continue throughout. These are single-celled or double-celled, usually with a rectangular east end, as at Jarrow (fig. 145: see WEARMOUTH-JARROW: ARCHITECTURE), Glastonbury, or Winchester (figs. 151–52: see WINCHESTER OLD MINSTER), but with apsidal east ends where there is strong Roman influence, as at Lincoln (St. Paul’s), in the Kentish group, or, later, at Brixworth (figs. 32–33: see BRIKWORTH) or Wing. Most styles have north and south or west adjuncts (porticus), and, although the main entrance seems to be through the western door, additional north and south doors are common.

More elaborate plans, in which the nave is flanked by a row of side chambers (as at Brixworth) or even by a true aisle (as at Lydd), occur but are rare. So far the only centrally planned building to set beside the documentary references is the crypt chapel of Repton. There is, however, evidence in the shape of upper doorways and beam settings that there could have been upper stories as well as western galleries and two-storied porches. High towers are a feature of late Saxon architecture, but it seems probable that low crossing towers could have developed by the 9th century.

Fabrics differ according to regionally available materials, but openings are cut straight through walls, and windows are single splayed. Little evidence survives for columns and capitals even of the crudest types, such as are commonplace on the Continent, although the royal mausoleum of the Saxon kings at Repton is an exception, and there are uncontexted capitals from Canterbury that could be ca. 800. Openings were normally supported on imposts that could be rectangular, champfered, or stepped and were usually decorated with simple moldings, although some, such as Hexham, Jarrow, Repton, or Winchester could be elaborate. In areas where good stone was available most buildings were decorated with carved ornament in the form of friezes and wall panels, as in the early Northumbrian buildings, such as Hexham, Wearmouth, and Jarrow, but most elaborately in late-8th- to early-9th-century buildings, such as Breedon (figs. 134–36: see STONEWORK AS ECCLESIASTICAL ORNAMENT) or Fletton. In addition there are decorated door openings, such as Ledsham, Yorkshire, or Britford, Wiltshire.

Edmund of Abingdon, or Edmund Rich (ca.

1170–1240)

Scholar and theologian, who taught at Oxford. Shortly after his election as archbishop of Canterbury (1233) he helped arbitrate a dispute between Henry III and a rebellious faction of barons, thereby averting civil war. His episcopate was fraught with conflict, and in 1240 he left England and died abroad. He was canonized 16 December 1246.

Edmund's best-known work is his *Speculum ecclesiae*, a treatise on the spiritual life that significantly influenced later devotional writings in England. It was probably first written in French for a religious community and later translated into Latin and ME; the famous ME lyric “Nou goth sonne vnder wod” appears in over 40 ME, French, and Latin manuscripts of the *Speculum*, as part of a meditation on Christ's passion.

Edward I (1239–1307; r. 1272–1307)

Usually rated as one of the great kings of medieval England. His reign

witnessed military triumphs against the Welsh and considerable successes against Scotland, apparently conquered by 1304. A magnificent chain of castles in north Wales is testament to the confidence of the age, and a succession of statutes bears witness to Edward's efforts to reform the legal system. In constitutional terms this reign was of fundamental importance in the development of parliament. Yet there are shadows in this picture. The later years of the reign lacked the constructive qualities of the earlier. War imposed an increasing strain upon political society and the economy. Law and order were not maintained with the expected vigor.

Edward is not an easy character to assess. Son of Henry III, he served a hard apprenticeship in his youth, displaying energy and ambition, with a reputation for false dealing in the civil wars of the early 1260s. He went on St. Louis's crusade in 1270 and was the only one of the leaders who did not abandon the expedition. He went on to the Holy Land, where he achieved little but greatly improved his public image.

On his return to England in 1274 major reforms were instituted. A massive inquiry that yielded the Hundred Rolls demonstrated that the king was committed to at least some of the concepts that had inspired the baronial reform movement of 1258. Yet there was no single principle providing consistency to the new statutes. Individual measures were devised to deal with particular problems; some favored the magnates, some their tenants, and some the merchants. A concerted campaign of *quo warranto* inquiries ("by what warrant") into baronial rights over jurisdiction lacked proper direction from above and became bogged down in technicalities, until a compromise was eventually worked out in 1290. The extent to which Edward was himself responsible for the legal measures is hard to assess; it seems probable that he left the details of drafting to his experts. In his personal conduct he was certainly not above manipulating the law in a cynical fashion. His desire to acquire sufficient lands with which to endow his children led him into some highly suspect dealing, such as defrauding the rightful heir to the Forz inheritance.

Edward was jealous of his own rights and privileges, and insensitive to those of others. He took an exalted view of his feudal rights of suzerainty in Wales and Scotland, and in both cases this led him into war. An autocratic determination to enforce his interpretation of his rights drove both Welsh and Scots to take up arms against him. Failure to reward his allies, such as the Welsh prince Dafydd and the Scottish magnate Robert Bruce, led to serious rebellions. He met his match, however, in Philip IV of France, and in 1294 English diplomacy suffered a serious reverse when the king's brother, Edmund of Lancaster, was duped into handing over the duchy of Gascony to the French without receiving adequate guarantees that it would be returned.

Edward's successes in war were not achieved by any brilliant strokes of generalship. Rather, efficient administration mustered the resources of the realm, in terms of men, money, and materials, on an unprecedented scale. This had severe political consequences; successive years of heavy taxation, after 1294, led to the major political crisis in 1297. The determination of Archbishop Winchelsey to follow the papal line, set out in the bull *Clericis laicos*, of not paying taxes to the lay power, added to the problems. Though civil war threatened, Edward persisted in his plans for a campaign in the Low Countries, for which he did not have an adequate army. He was fortunate in that the French king failed to appreciate the weakness of the English position, while a defeat in Scotland at Stirling Bridge brought the English baronage back to a sense of patriotic duty. The political crisis was settled with the issue of the *Confirmatio cartarum* (Confirmation of the Charters).

Edward's reign was important for the evolution of parliament. The hearing of petitions and determination of cases have been stressed by some historians, but parliament was also the occasion for the discussion of great affairs of state. Representatives of shire and borough, and of lower clergy, attended only a minority of parliaments, but the concept that they should come with full power (*plena potestas*) to consent on behalf of their communities was established. How far the king considered himself bound by such ideas as "What touches all should be approved by all" (*quod omnes tangit*) is open to doubt; that phrase was used only once in a parliamentary summons and is likely to have been inserted by a clerk, not the king himself. Examination of the limited nature of royal patronage does not suggest that Edward was a man who believed in the subtle arts of political management; his style was brusque, autocratic, and effective.

Edward was a conventionally religious man who founded the Abbey of Vale Royal in fulfillment of a vow taken when he thought he was about to be shipwrecked. The work on the abbey, however, was abruptly terminated in 1290. His piety did not lead him into any subservience to the church. He faced considerable difficulties from archbishops Pecham and Winchelsey, two of the few able to stand up to the masterful king. He was clearly fond of his first queen, Eleanor of Castile, in whose honor he had a fine series of commemorative crosses built. He also seems to have been fond of his daughters, but his relationship with his heir, the unsatisfactory Edward II, was a stormy one.

The final years of the reign were difficult. There were financial problems, with a debt increasing to about £200,000. Public order was poorly maintained as a result of the governments singleminded concentration on war. English forces proved incapable of dealing with the Scots under Robert Bruce. The legacy Edward left his son was an impossible one.

Edward II (1284–1327; r. 1307–27)

Fourth but only surviving son of Edward I and Eleanor of Castile; born at Carnarvon (modern Caernarvon) in north Wales in April 1284. The tradition that Edward was presented to the recently conquered Welsh as a prince born in their own land and knowing no English may be unsupported, but there is little doubt that Edward I wished his latest child to be born in Wales to strengthen the allegiance of the Welsh to his crown. In any event Wales was a thread that ran through the career of Edward of Carnarvon; he became Prince of Wales in 1301, he fled there in a vain search for safety in 1326, and it was from Wales that one of the conspiracies to release him from captivity arose in 1327.

Edward's early career was shaped by the conflicts of his fathers reign. He was in nominal charge of England as regent during the crisis of 1297–98, while his father was in Flanders fighting the French; he was present at the siege of the Scottish castle of Caerlaverock in 1300 and held his first independent military command in Scotland in 1301. While he achieved nothing spectacular on any of these occasions, he was following the practical education of a young

prince, destined to become king, and left a generally good initial impression.

Edward's personal relations with his father deteriorated in Edward I's last years. No son could have matched the energy and determination of Edward I or have avoided arousing the old king's ferocious temper, made worse by the ills of old age and the sense of failure in Scotland. But it was also becoming apparent that the younger Edward lacked seriousness and application; his reliance on favorites was likely to cause severe political problems when he succeeded his father.

The earliest and most controversial of the favorites was the young Gascon knight Piers Gaveston. It is ironic that his membership in the household of the future king, which he had joined by the end of 1300, was occasioned by Edward I himself, impressed by Gaveston in the Flemish campaign of 1297 and thinking him a suitable model for his son. Although it is usually considered that a sexual relationship developed between Edward II and Gaveston, this is far from certain. Both men also married and produced children, with in Edward's case at least one illegitimate offspring as well.

Trouble swiftly followed Edward's accession in July 1307. The financial and administrative confusion left by Edward I led to demands for reform of royal government; baronial resentment at the promotion of Gaveston to the royal earldom of Cornwall ensured that the demands would be combined with personal enmity. The reform program of the Ordainers, the nobles who banded together in 1310–11, presenting ordinances in which they summarized their demands, and the exile of Gaveston that followed did not solve these problems. After Gaveston was murdered in 1312 by the king's opponents, the earls of Warwick and Lancaster, Edward was consumed by a desire for vengeance, finally achieved in 1322.

In the meantime England went through a prolonged crisis. In June 1314 Edward II's attempt to renew the war in Scotland failed; a humiliating defeat at Bannockburn was followed by destructive Scottish raids on the north and a Scottish invasion of Ireland. Military defeat led to further political tension, as Warwick and Lancaster attempted to enforce the Ordinances.

Bad weather, famine, and disease in 1315 and 1316 spread general misery throughout the realm. A political settlement between Edward and Lancaster in 1318, after long and tortuous negotiations, was disrupted by the rise of another royal favorite, Hugh Despenser the Younger. The civil war that had threatened since 1312 finally broke out in 1321 and ended in March 1322, with Edward's victory at Borough-bridge, the execution of Lancaster and other opponents, and the annulment of the Ordinances.

Edward's ruthlessness in victory and the power exercised by Despenser led swiftly to the final disasters of the reign. In September 1326 Edward's estranged wife, the French princess Isabella, invaded England with her lover,

Roger Mortimer of Wigmore. In January 1327 Edward II was deposed and his son Edward III crowned in his place. Edward II was imprisoned in Berkeley Castle near Bristol, and in September 1327 it was announced that he had died. Although the terrifying description of Edward's death recorded by some of the chroniclers cannot be confirmed, it is likely that he was murdered, probably on the orders of Mortimer.

Ironically the king who had been a failure in life was regarded by some as a martyr; his tomb at Gloucester Abbey became a place of pilgrimage and alleged miracles. Nonetheless, for a few years, rumors circulated that he had escaped from Berkeley. The most circumstantial of these claimed that he had wandered through Europe before settling in Italy as a hermit. In 1385 Edward's great-grandson Richard II began a long but unsuccessful attempt to have Edward canonized. Edward II's personal failings accounted for many of the problems of his reign. But it is also certain that he inherited many problems, financial, political, and military. Under the circumstances it is doubtful if Edward II could have succeeded, even if he had possessed all the talents and energy of his redoubtable father.

Edward III (1312–1377; r. 1327–77)

Edward achieved stunning military success against Scotland and France while maintaining domestic harmony for most of the 50 years he ruled. His early years were overshadowed by the political storms that had engulfed Edward II. When he was sent to France in 1325 to do homage for Gascony, he joined his mother, Isabella, who engineered Edward II's overthrow the following year. The young Edward was crowned on 25 January 1327, only fourteen years old, after parliament had deposed his father. A year later he married Philippa of Hainault, whose father had contributed heavily to Isabellas invasion.

Edward was tightly controlled by his mother and her lover, Roger Mortimer, sparking new conflict. Henry of Lancaster led an abortive rebellion in 1329, and Edwards uncle the earl of Kent was summarily executed in 1330 for plotting against them. Finally Edward and a group of young courtiers seized Mortimer in October 1330. He was tried in parliament and executed. Isabella received a generous estate, where she lived until her death in 1358.

Edward then turned his attention to Scotland. After covertly aiding Edward Balliol, a claimant to the Scottish throne, and the "Disinherited" (Balliol's followers) in their attempt to recover power he marched northward in 1333, defeated the Scots at Halidon Hill on 19 July, and captured Berwick. It was the first English victory in years, but it did not subdue the Scots. Subsequent campaigns likewise failed to deliver a decisive blow.

France also demanded Edward's attention. The last Capetian king, Charles IV, had died in 1328 without descendants, and his cousin Philip of Valois had taken the throne. Edward had a claim through his mother, Charles's sister, even though he had twice performed homage for Gascony. When Philip moved to seize Gascony as well as aid the Scots, Edward won parliamentary approval in 1337 to pursue his claim. The enterprise was a disaster. He spent lavishly but achieved little. Despite a victory over the French fleet at Sluys on 24 June, by the end of 1340 he was broke and forced to conclude an ignominious truce.

This fiasco precipitated a political crisis in 1341. Unjustly blaming his officials for the failure, Edward stormed back to England, fired them, and launched an investigation into their misconduct. His anger focused in particular on his chancellor, the archbishop of Canterbury, John Stratford. In reality the wartime demands had been excessive. A restive population spurred Commons to demand reforms. Edward was forced to concede a statute limiting his power, though he overturned it later in the year.

The disputed inheritance of Brittany in 1342 gave Edward an opportunity to return to campaigning, and when the truce with France expired in 1345 he was ready for war. Armies under the earls of Lancaster and Northampton were

successful in Gascony and Brittany. The greatest victory came in 1346, when Edward defeated the much larger French army at Crécy on 24 August. Then, on 17 October, the English defeated the Scots and captured King David at the Battle of Neville's Cross. The following year Calais fell to Edward.

Despite these brilliant victories Scottish resistance continued and the French refused to accede to Edward's demands, especially after Philip died in 1350 and John II (1350–64) came to the throne. Though Edward's prestige had risen tremendously, throughout the 1340s Commons still complained about taxation and purveyance. The complaints did not provoke conflict, but Edward had to negotiate carefully. Furthermore the Black Death struck in 1348–49, causing widespread death and havoc.

The war with France resumed in 1355, when Edward dispatched two armies under his son Edward the Black Prince and his cousin Henry of Lancaster. They were smaller than earlier ones but more destructive. The campaigns, called *chevauchées*, were intended to disrupt the enemy, rather than engage in set battle. The French army under King John, however, on 19 September managed to catch the Black Prince at Poitiers, where the English again prevailed over superior forces and even took John prisoner. Despite the triumph the French refused to give in to Edward's demands. He led another army to France in 1359 with the aim of being crowned at Reims, but the mission failed. In 1360 he concluded the Treaty of Brétigny, which gave him some of the territory and authority he sought.

Despite these disappointments Edward was at the peak of his career. His fame spread throughout Europe, and he was popular at home. Through his military triumphs, his participation in tournaments, and his founding of the Order of the Garter in 1346–47 he had become a chivalric hero. During the 1350s and 1360s revenues from customs and the ransoms of David of Scotland and John of France allowed him to reduce the level of direct taxation, producing greater harmony with parliament. His family was large and illustrious.

The end of his reign was less glorious. Queen Philippa's death in 1369 seems to have affected him deeply, though he took a mistress, Alice Perrers. When war resumed with France in 1369, the English position disintegrated. Edward's son John of Gaunt, who took over leadership, was less capable than his ailing elder brother, the Black Prince, and expeditions in 1369 and 1373 produced little. England was forced to give ground. Moreover discontent at home increased as high taxation resumed. Plague struck again in 1360–61 and 1374. The court was dominated by a small group of courtiers around the grasping Alice, enriching themselves at public expense. In the Good Parliament of 1376 Commons impeached the courtiers and called for sweeping reforms. Edward, who did not participate, was forced to grant its demands. He died less than a

year later, on 21 June 1377, and was succeeded by his grandson Richard II, whose father, the Black Prince, had died in 1376.

Edward's character is difficult to reconstruct, because chroniclers tended to treat him heroically without offering personal insights. He clearly inspired great *esprit de corps* among the nobility and soldiers. He loved display and indulged in tournaments, ceremonies, and pageants. He was also quick-tempered and tended to blame others for his misfortunes. He was conventionally pious, making pilgrimages to holy sites in England before and after campaigns and giving to the church; he also distrusted clergymen and for the first time appointed laymen as chancellor and treasurer in 1341 and 1371. Finally, despite their immediate glory, his victories in France did not bring lasting success nor were they universally popular in England, where peasants and townsfolk had to shoulder the burden of paying for war.

Edward IV (1442–1483; r. 1461–70, 1471–83)

Contemporaries and near-contemporaries found Edward a man of contradictions; historians since have brought in contrasting—even conflicting—verdicts. The influential Burgundian commentator Philippe de Commynes, who met him at least twice, portrayed Edward as a handsome and courageous prince but an indolent and pleasure-loving king, preferring mistresses to ministers and with little taste for the arduous day-to-day business of government.

The second continuator of the Crowland Chronicle probably knew Edward well and found much to admire in his administration; yet he was puzzled that a man generally thought “in his day to have indulged too intemperately his own passions and desire for luxury” should have been so successful. Similarly the Italian Dominic Mancini, in London in 1482/83, found his character and behavior paradoxical: a man of “gentle nature and cheerful aspect” and “easy of access,” who lent a “willing ear” to complaints of injustice, yet “licentious in the extreme” and notably avaricious.

Historical verdicts on Edward IV have ranged widely indeed. Early Tudor writers certainly believed he had been a judicious and popular king whose political achievements were as noteworthy as his sexual stamina and athleticism. “Much given to bodily lust,” declared Polydore Vergil, but sufficiently “diligent in his affairs” to bequeath “a most wealthy realm abounding in all things.” Whatever his moral failing, echoed Sir Thomas More, in Edward’s later years “this realm was in quiet and prosperous estate.” Yet the Victorian Bishop Stubbs concluded that Edward was “a man vicious beyond any king... since the days of King John, and more cruel and bloodthirsty than any king [England] had ever known.” By contrast Stubbs’s contemporary J.R. Green believed that the king’s “indolence and gaiety” were “mere veils beneath which [he] shrouded a profound political ability.”

More recently J.R. Lander has viewed Edward as “a strong man who began to restore order and even, possibly, financial stability.” Charles Ross has concluded that Edward, though intelligent, good-natured, courageous, and fully committed, too often lacked foresight and consistency and bequeathed a potentially disastrous political legacy to his young son.

The eldest son of Richard duke of York, Edward earl of March spent his teenage years in the shadow of the Wars of the Roses, as his father mounted an increasingly determined and violent challenge to the inept Henry VI and his notoriously partisan regime. After a victory at St. Albans in February 1461 Edward entered London, and the kingdom was willing to accept him as king (formal accession 4 March 1461). Once king, Edward IV was a startling contrast to his predecessor: presiding over a magnificent court, firmly controlling his council, personally appearing in parliament, progressing regularly around his realm, and taking responsibility for policy making from

the very beginning.

Militarily Edward's victories at Mortimer's Cross and Towton in 1461 were crucial in establishing him on the throne. The defeat of the Lincolnshire rebellion in 1470 owed much to the king's energy and speed of action, and the campaign of March to May 1471 was a triumph. And yet he was strangely inactive in countering Lancastrian resistance in the early 1460s, and his sluggish response to rebellion in 1469 resulted in the debacle at Edgecote and his own short-lived imprisonment by Warwick the Kingmaker.

Politically the pattern is similar. Edward's shrewd generosity to men like William, Lord Hastings, paid off spectacularly, while John Tiptoft, earl of Worcester, proved a disaster. The king's marriage to Elizabeth Wydeville, an ambitious Lancastrian widow with two children, was politically inept (however much he may have loved her). His pro-Burgundian foreign policy, entailing as it did the alienation of Warwick, eventually culminated in the short-lived Readeption of Henry VI (the phrase used to refer to Henry's brief return to the throne, under Warwick's control, from October 1470 to April 1471).

Edward's real achievements, such as they were, came after his restoration in 1471. Then he made real progress in reestablishing royal authority, largely through the medium of his household. He tackled the problem of royal insolvency with some success (as the well-informed Crowland chronicler emphasized), and the years of civil war seemed at last to be over. Yet the king's growing high-handedness (as in the trial and execution of his brother Clarence in 1477/78) and avarice brought charges of despotism, and his foreign policy left England isolated and apparently on the brink of a new continental war. Edward's failure to resolve factionalism certainly helped create the opportunity for Richard of Gloucester's usurpation following Edward's sudden death in April 1483.

Edward V (1470–1483)

Elder son of Edward IV. There has been endless speculation about Edward’s birth: whether or not he was illegitimate, as Richard III alleged at his usurpation. There is still more regarding his death: when, by whose orders, or even whether he and his younger brother, Richard of York, were murdered in the Tower of London. Even during the few weeks he nominally occupied the throne he can only be glimpsed fleetingly.

Born in the sanctuary of Westminster Abbey on 2 November 1470 (where his mother, Queen Elizabeth Wydeville, had fled on the eve of the Readeption, or restoration to the throne, of Henry VI, October 1470 to April 1471), he spent most of his life at Ludlow in the Welsh march, a Wydeville-dominated environment. In 1473 the queen’s brother Anthony, Lord Rivers, was appointed “governor and ruler” of the prince. John Alcock, bishop of Rochester, became his tutor and took charge of his household, and elaborate ordinances for his daily life and education were drawn up. Every waking moment was to be occupied, seemingly, whether in Christian devotions, listening to “such noble stories as it behoveth a prince to understand,” or undertaking suitable “disports and exercises.” By 1483, according to the antiquary John Rous, “brought up virtuously by virtuous men,” he was already “remarkably gifted and well advanced in learning for his years.”

Arguably, once his father, Edward IV, died on 9 April 1483 and Richard of Gloucester set his sights on the throne, Edward V's days were numbered. Within four weeks the young king had been firmly secured by his uncle, his companions arrested. The rest of his life was spent in the Tower, where his brother joined him on 16 July, and, although they may have been seen "shooting and playing in the garden" there for a time, they soon vanished.

"I have seen many men burst into tears and lamentations when mention was made" of the newly bastardized and deposed Edward V, recollected Dominic Mancini in 1483, "and already there was a suspicion that he had been done away with." The balance of likelihood is that Edward and his brother did indeed meet a violent end before the rebellion in October 1483 and that responsibility for their deaths lay with their uncle, Richard III.

Edward the Black Prince (1330–1376)

Eldest son of Edward III and Queen Philippa of Hainault, earl of Cornwall and Chester, Prince of Wales, and legendary exemplar of 14th-century chivalry and knighthood. His military reputation rests on his major share in great victories of the Hundred Years War. As a youth he fought at Crécy (1346). Appointed king's lieutenant in the duchy of Aquitaine in 1355, he successfully led the Anglo-Gascon troops at Poitiers (1356), capturing the French king. His final success was at Najéra (1367), where he led a large Anglo-Gascon army across the Pyrenees to defeat the combined French and Spanish forces, again taking valuable prisoners.

These victories brought the prince personal glory and valuable ransoms and

loot, as did the raiding expeditions he initiated from Aquitaine; they achieved no permanent advantage for England. His peacetime passion for tournaments and rich spectacles enhanced his chivalric prestige among his contemporaries. When in 1362 Edward was named prince of an Aquitaine now greatly extended by English conquests, he had the difficult task of incorporating the new territories into the old duchy. He proved incompetent both as ruler and statesman.

His delayed marriage, at age 30 to Joan of Kent, a widow famed for her beauty, appears to have been happy but provided neither diplomatic nor political advantages for the crown. Easily outmaneuvered politically by Charles V of France, Edward indulged in expensive dreams of Spanish conquest while the French recovered their losses in Aquitaine. In 1371 he returned to England a sick man. He died in 1376, leaving his nine-year-old son Richard as heir to the throne. Pious, extravagant, brave, but ultimately ineffective, the Black Prince's fame rests on his reputation as the ideal representative of 14th-century chivalry. His traditional sobriquet is a reference to the black suit of armor in which he fought.

Edward the Confessor (1002/05–1066; r. 1042–66)

Edward owes his title of Confessor to his canonization in 1161 by Pope Alexander III at the request of Henry II and the church and at the instigation of the monks of Westminster Abbey, where he was buried. Although the historical figure and the image of the Confessor have little in common, the title serves to distinguish him from such Anglo-Saxon kings as Edward the Elder and Edward the Martyr.

Edward was born at Islip, near Oxford, between 1002 and 1005, the seventh son of Æthelred II, “the Unready,” and the first from his second marriage, to Emma, sister of Duke Richard II of Normandy, an alliance designed to protect the king from Viking attacks. Edward’s “miraculous” acquisition of the throne in 1042, after 24 years of obscure exile in Normandy and its environs (1017–41), was made possible by the deaths of the Danish usurpers Cnut and his sons, Harold Harefoot and Harthacnut, and of most other potential pretenders, his younger brother, Alfred, and his six senior half-brothers, represented only by Edmund Ironside’s son, Edward “the Exile,” in Hungary.

But to gain and hold the throne Edward had to accept the protection of Godwin, earl of Wessex, marry Godwin’s daughter, Edith (Eadgyth), and raise his sons to earldoms. Edward found it hard to break free. Because of Cnut’s division of the kingdom into great provincial earldoms and the erosion of the royal demesne Edward could provide only small estates for his French followers. Although he had more scope in the church and appointed some interesting continentals to bishoprics, his best hope of independence lay in the suspicion of Godwin felt by the other great earls, the English Leofric of Mercia and the Danish Siward of Northumbria.

Like his father, Æthelred II, Edward has an undeserved reputation as a weak king. Healthy, a keen hunter and soldier, a great survivor, and—although occasionally rash and ill advised—determined not to go on his travels again, he warded off his external enemies by warlike gestures and shrewd diplomacy. He exploited his childlessness—explained by later legend as due to an unconsummated marriage—as a diplomatic asset, making empty promises of the succession to Earl Godwin’s nephew, King Swein of Denmark, in the 1040s; his cousin-once-removed William duke of Normandy, at the end of the decade; his half-nephew, Edward the Exile, in 1054–57. He may also have aroused the

hopes of other relatives of his parents and wife.

In 1051, under the influence of Robert of Jumièges, a Norman abbot whom he made bishop of London and then archbishop of Canterbury, Edward fell foul of his father-in-law and provoked a showdown. Godwin's half-hearted rebellion collapsed when earls Leofric and Siward supported the king; the rebel and his sons were outlawed and fled abroad. In the following year, however, they returned by force and, as Leofric and Siward, alienated by Edward's willfulness, now stood aloof, secured their restoration. This time it was Robert of Jumièges and other Frenchmen who fled.

After Godwin's death in 1053 Edward and the Godwinsons reached a *modus vivendi*, and a period of prosperity set in. According to the *Vita Aedwardi regis*, an early account of the reign, the dominance of Godwin's children made England great. Harold, earl of Wessex after 1053, ruled the south; Tostig, after 1055 earl of Northumbria, ruled the north; Queen Edith ruled the court. The Welsh and the Scots were dominated, good laws prevailed, and the king and queen refounded monasteries as their mausoleums. But in 1065 some of Tostig's vassals rebelled against his harsh rule, Harold would not save his brother from exile, and Edward's mortification was such that he suffered a fatal stroke.

He died on 5 January 1066, just after the dedication of his new church at Westminster (pictured on the Bayeux Tapestry). His achievement was to have held his unstable kingdom together for 24 years and bequeath it intact to his brother-in-law Harold. No wonder that in the following centuries the "Laws of King Edward" became the symbol of a Golden Age.

Eleanor Crosses

Twelve sculpted stone crosses were erected by Edward I between 1291 and 1295 to mark the resting places of the funeral procession of his wife, Eleanor of Castile (d. 1290), from Hardby in Lincolnshire, where she died, to Westminster, where she was buried. Crosses were erected at Lincoln, Grantham, Stamford, Geddington, Hardingstone, Stony Stratford, Woburn, Dunstable, St. Albans, Waltham, Cheapside, and Charing; only the crosses at Geddington, Hardingstone (Northamptonshire), and Waltham (Essex) survive. The crosses are generally considered to signal the beginning of the Decorated style of English Gothic.

A record of payments for the Eleanor crosses survives (London, PRO E.101/353/1), which provides a detailed account of the artists involved in the monuments' production. Richard of Stow was responsible for the cross at Lincoln; Michael of Canterbury carved the Cheapside cross, for which he received £300; Richard of Crundale made the cross at Charing; five of the crosses (Hardingstone, Dunstable, St. Albans, Stony Stratford, and Woburn) were the work of John of Battle.

The Hardingstone cross is one of the most luxurious. The base is octagonal in form and divided into three tiers; the lowest tier is decorated with blind arcades articulated by seaweed foliage and enclosing open books and the arms of Ponthieu, Castile, Leon, and England, the arches separated by pinnacles; the middle tier consists of four open cusped ogee arches decorated with blind tracery and foliage and housing statues of the queen; the top story is decorated with blind arches capped by foliate pinnacles. The three statues of Eleanor by William of Ireland show an awareness of continental developments. The queen is idealized with a delicate head and long flowing hair. Her body appears somewhat short and fat, due in part to the voluminous and decorative folds of her drapery.

The Geddington cross is delicate in appearance, employing many of the motifs popular in contemporary metalwork. The lower tiers are decorated with diaper pattern and shields; the gabled arches (blind on the lower tier, open on the middle tier) are capped with foliate finials. The emphasis is on straight vertical lines. The statues of the queen are in a much simpler and less refined style than William of Ireland's, suggesting the work of provincial craftsmen.

The Waltham cross is identical in plan to that at Hardingstone, but the decoration is quite different. The lowest tier is covered with elaborate blind tracery and niches housing shields; the middle tier consists of graduated buttresses capped with foliate finials and houses three statues of the queen by Alexander of Abingdon (also the sculptor of the Charing statues). Alexander's statues are the most refined and elegant of the group. Again Eleanor is idealized with a graceful face and long flowing hair; her slim body is carved in a slightly swaying pose, one hand delicately holding the strings of her cloak.

The Eleanor crosses were erected out of Edward's love for his dead queen but also out of emulation of the French court; they appear to have been inspired by a series of similar crosses erected for St. Louis by Philip III in 1271. They are also part of a much larger series of monuments memorializing Eleanor, including her tomb at Westminster; a shrine encasing her heart in London Blackfriars, which consisted of a golden angel set on a cenotaph decorated with weepers; a tomb for her bowels in the Lincoln Lady Chapel decorated with metal weepers and a gilt-bronze effigy of the queen; and chantries at Hardby, Lincoln, Peterborough, and London Blackfriars.

Eleanor of Aquitaine (ca. 1122–1204)

The duchy of Aquitaine was the largest, most populous region of France in the 12th and 13th centuries. Its proximity to the Mediterranean and its cultural and commercial contacts with the Greek and Byzantine worlds attracted wealth and immigrants. It was openly coveted by French kings, who, in the 13th century, would rely on the pretext of eradicating heresy to invade it. Earlier, in the 10th and 11th centuries, it had been controlled, for the most part with generosity and flexibility, by dukes whose creativity and precocity are legendary. William III founded the Abbey of Cluny in 910; William IX offered his irreverent troubadour poems to the courts of Europe.

In 1137 the only child of William X, Eleanor, who possessed the spirited character of her forebears, inherited the duchy and was immediately married to the French king, Louis VII. Later, after befriending Geoffrey, count of Anjou, she became wife to his son, the future Henry II of England. The marriage not only transferred the richness of Aquitaine from the French to the English monarchy, where it remained until 1214, but it united two formerly competing provinces.

Thus it might be supposed that Eleanor was a key individual in the government of the Angevin Empire, but the evidence for her influence is slight. Narrative sources deal mainly with the kings, and she appears fleetingly in them. Few charters are extant from Poitou, which Eleanor governed in the 1160s and 1180s. In other areas of the Angevin Empire, where more charters survive, she attested infrequently—a reflection, perhaps, of the time spent early on bearing children and her long interval of imprisonment.

Eleanor supported Henry II's early endeavors to expand and control Angevin lands and, later, her sons' revolts against their father to obtain portions of those lands; her independent policies are difficult to trace. Her cultural influence may have been pervasive, however. The movement of her court from southern to northern France and England helped convey the ideals of courtly love to the European nobility. Romantic themes found full literary expression at the court of her daughter, Marie countess of Champagne, who sponsored the work of Chrétien de Troyes, and in her son Richard the Lionheart, whose love songs were sung throughout France.

Thus Eleanor is often viewed as a mirror of her husbands' and sons' achievements. It is perhaps more instructive to view her condition as fairly typical of women of the upper nobility in the high Middle Ages. Despite her talent and strength of character her key roles involved bearing children and the transfer of land. Married at fifteen, she lost her first child when he was three years old, and she bore her last, John, in what was likely to have been a

difficult pregnancy, at 44. Her willful nature embarrassed Louis VII, incurred the censure of his clerical friends, and may have brought about their divorce after fifteen years of marriage (1137–52), although there is some suggestion that Eleanor herself engineered the split.

She protested the infidelity of her second husband, Henry, whom she married at 30 (when he was only 19) and to whom she would be wife for 37 years (1152–89). This audacity, together with her power over her children and her influence in Aquitaine and at the English and Angevin courts, resulted in imprisonment at Winchester for sixteen years (1173–89, when Henry died). After regaining her freedom she acted as regent for both Richard and John, realizing her potential only in widowhood.

Eleanor's acts involved a reversal of Henry's oppression—amnesty for those awaiting judicial trial and a relaxing of obligations imposed on abbeys—as well as patronage. She protected Richard's interests against the ambitions of France's Philip Augustus and Prince John. Then, when Richard died in 1199, Eleanor undertook goodwill visits on John's behalf. Toward the end of her life, dispirited and worn, she took up residence at the Angevin abbey of Fontevrault, where she is buried.

Elstob, Elizabeth (1683–1756)

Anglo-Saxonist and advocate of women's education. Born in Newcastle-upon-Tyne, Elstob lost her father when she was five and her mother, who instilled in her the love of learning, three years later. She then passed into the

guardianship of her uncle the Rev. Charles Elstob, prebendary of Canterbury, who refused to allow her to continue her study of Latin on the grounds that “one Tongue is enough for a Woman” (as Elizabeth later explained), although eventually he permitted her to study French.

In 1691 Elstob’s brother William (1673–1715) entered Queen’s College, Oxford—the preeminent center for Anglo-Saxon studies in the late 17th and early 18th centuries—and in 1696 was elected Fellow of University College, whose master, Arthur Charlett, promoted Anglo-Saxon studies and encouraged the great Anglo-Saxon paleographer Humfrey Wanley (1672–1726). It was Williams transcription, made in 1698, of the OE version of Orosius’s *History against the Pagans* that fired his sister’s interest in the language. When in 1702 William moved to London as rector of St. Swithun’s, Elizabeth joined him there and was able to pursue unhindered her zest for scholarly work. Her first publication, a translation of the *Discours de la gloire* by Madeleine de Scudéry (1607–1701), appeared in 1708 and was followed a year later by her edition and English translation of Ælfric’s homily on Pope Gregory the Great, which she entitled *An English-Saxon Homily on the Birth-Day of St. Gregory*. By now she was well known to the circle of Anglo-Saxonists and enjoyed the support of George Hickes (1642–1715), the foremost English scholar of the northern European languages and a proponent of female education.

Elstob’s final publication, *The Rudiments of Grammar for the English-Saxon Tongue* (1715), drew upon Hickes’s own monumental study of OE grammar in his *Linguarum veterum septentrionalium thesaurus* of 1703–05. Elstob also made an unpublished transcription of the Textus Roffensis, a Rochester Cathedral manuscript containing Anglo-Saxon laws, and planned a complete edition of Ælfric’s homilies. The greater part of her manuscript for this edition, described by Hickes as “the most correct that I ever saw or read,” survives as BL Lansdowne 370–74 and Egerton 838. Although 36 pages of proofs were issued by the Oxford press, the edition never appeared, for, following the death of both Hickes and her brother William in 1715, Elstob’s fortunes declined dramatically. Within a few years, burdened by debt, she left London, entrusting her books and papers to a neighbor who emigrated to the West Indies soon after; Elstob never recovered her belongings.

Elstob herself disappeared from view for several years, and she never revived her scholarly career. By 1735, when she began a fruitful correspondence with the antiquary George Ballard (1706–1755), she was teaching in an elementary school at Evesham, Worcestershire. Dogged by ill-health for the rest of her life, in 1739 she was appointed governess to the children of Margaret, duchess of Portland (daughter of Edward Harley, second earl of Oxford), a post that she retained until her death. Her correspondence with Ballard and others, while attesting to her happiness in overseeing the

education of her charges, reveals also an abiding regret at her isolation from the scholarly world.

Elstob's achievement in the period of her life that she devoted to OE studies was notable. On her own analysis she was "the first Woman that has Studied that Language since it was spoke." Her *English-Saxon Homily* provided, for the first time, a full edition of one of Ælfric's homilies accompanied by both footnotes and an English translation. Elstob's lengthy introduction to the book—which, along with the long list of subscribers at the end, prompted the Oxford antiquary Thomas Hearne (1678–1735) to dismiss the work, unjustly, as "this Farrago of Vanity"—incorporated a feminized vision of English history that stressed the role of Bertha, queen of Kent, in the conversion of the Anglo-Saxons by St. Augustine and furnished a list of illustrious English women down to Queen Anne herself, to whom the book was dedicated. The initial that begins Elstob's English translation of the homily includes her own portrait.

The *Rudiments of Grammar*, conceived after a young woman had expressed to her a wish to learn OE, was intended by Elstob to enable other women to attain "the Pleasure I myself had reaped from the Knowledge I have gained from this Original of our Mother Tongue." By writing the book in English rather than Latin Elstob made it accessible to women and was able to demonstrate the kinship between OE and the English of her own day. In the *Apology for the Study of Northern Antiquities* with which she prefaced the work, she vigorously defended OE against the attacks of, among others, Jonathan Swift (1667–1745), who had branded the language as barbarous. It is to be lamented that Elstob's scholarly career was abruptly curtailed by circumstance. She herself, in her letters and in the brief autobiographical memoir that she wrote for Ballard in 1638 (Bodl. Ballard 43, fols. 59v–60r), showed a keen awareness of the many disappointments of her life. Nonetheless, her published work, admired by her contemporary Anglo-Saxonists, stands as a landmark in the history of OE studies.

Ely Cathedral

The Benedictine abbey church of Ely ([fig. 58](#)) was commenced about 1081 by Abbot Simeon, brother of Walkelin, bishop of Winchester. The eastern arm and probably the transepts and eastern bays of the nave were finished for the 1106 translation of St. Etheldreda. Cathedral status was granted in 1109. The presbytery was built between 1234 and 1251, and the choir was rebuilt after the fall of the tower in 1322, at which time the crossing was expanded into the magnificent Octagon.

Of the four-bay Romanesque presbytery the responds of the triumphal arch are extant. The stilted apse was soon squared off. The aisles terminated in flat east walls. At the apse chord the galleries and clerestories were probably linked

with spiral staircases, as at Peterborough Cathedral. The Romanesque transepts and nave are well preserved. As at Winchester the transepts have eastern and western aisles, and were built with cross-aisles. The latter were replaced (ca. 1150) by the present walkways. The thirteen-bay nave terminated in an aisleless western transept (of which only the southern arm is preserved) with double-story apsidal chapels to the east, a single tower, and a galilee porch, the latter built by Bishop Eustace (1197–1215). The great length of the church recalls the largest early Christian basilicas in Rome and conforms to the post-Conquest trend established at St. Albans (1077) and Winchester (1079) for churches with the relics of important local saints. The three-story elevation with equally proportioned main arcade and subdivided gallery arches, and a clerestory with wall passage, evolves from Winchester and belongs to the type established at St. Étienne at Caen. The transept main arcades have plain two-order arches carried on volute capitals except in the west arcade of the north transept, where scalloped capitals are introduced. Compound and columnar piers are used but not in a straightforward alternation; in the north transept the middle pier of both arcades is columnar, while in the south transept the column is the third from the crossing—a strange arrangement given that it originally carried the arch of the terminal aisle.

This variety in pier design continues with more complex forms in the second campaign of construction in the transept galleries, in which cushion capitals are used exclusively and the arches have three orders and roll moldings. In the main arcades of the nave, major compound piers alternate with minor piers of columnar plan that, like the major piers, have dossierets (additional stone blocks between their capitals and the arch spandrels) and half-shafts on the back and front to uniformly accommodate the transverse arches of the aisle vaults and the vertical articulation to the top of the wall. The minor piers in the nave galleries also have shafts to east and west to carry subarches. The aisles are groin-vaulted throughout and in the nave, on the model of Norwich Cathedral, have round-headed dado arcades below chevron stringcourses. The influence of the Norwich crossing tower is evident in the lavish interior articulation of the southwest transept, on which work was completed by Bishop Riddel (1173–89).

The Monks' and Prior's doorways are richly carved, the latter with Christ in Majesty in the tympanum. Certain forms suggest Italian connections, while the figure style conforms to late Anglo-Saxon traditions. The luxuriant foliage forms also appear in the possibly contemporary vault paintings in the south nave aisle.

Emma (ca. 985–1052)

Danish attacks, conquest, and the resulting complexity of succession to the English throne in the 11th century were the context of the power and role of Emma, queen of England. Daughter of the duke of Normandy, she was married to Æthelred II in 1002 as part of an alliance against Danish attacks. In 1017 Cnut took her as wife in his quest for legitimacy and security. Emma had sons by both husbands: Edward the Confessor and Alfred by Æthelred, Harthacnut by Cnut.

Emma's role in Æthelred's reign mirrored that of 10th-century queens, important at court but rarely dominant during the husband's lifetime. As Cnut's wife she was prominent. Cnut's insecurity and his prolonged absences in Denmark gave her an increasing role in patronage and at court; she may have acted as regent. On his death Emma attempted to ensure the rule of one of her sons against Cnut's son Harold Harefoot, born to Ælfgifu of Northampton. She seized the treasure at Winchester, but her initiative was thwarted, since Harthacnut lingered in Denmark and Edward and Alfred attracted little support from the English nobility. Harold gained ground and Emma was exiled. Harold's death in 1040 allowed her to return with Harthacnut; in 1041 they brought Edward into association as the probable heir.

After Edward's accession in 1042 Emma's power waned. She had little influence over an adult son, who had been exiled for 25 years. She spent her last decade in religious obscurity in Winchester.

Emma was an active political woman at a time when complex and turbulent English politics proved a graveyard for many reputations. She answered the accusations touching her shifting loyalties and family alliances by commissioning the fascinating *Encomium Emmae*, written in the 1040s by an anonymous monk of St. Bertin or St. Omer in Flanders. That work, like her career, shows her fortunes bound to those of husband and sons and the lack of an independent basis of action for even the most powerful and able woman.

Enamels, Gothic

Among the handful of surviving English Gothic metalwork objects only a fraction demonstrate the skill of the enameLER. Enameled ecclesiastical items suffered the same intentional destruction as other types of metalwork during the Dissolution of the monasteries in the 16th century, while secular pieces frequently fell prey to changes in late-medieval taste. In addition the fragility and high intrinsic value of Gothic enamels made their survival even more hazardous. Many of the rare enameled survivals have lost much, or all, of their original enamel: an example is the silver-gilt Bermondsey Dish (London, Bermondsey parish church, on loan to the Victoria and Albert Museum), ca.

1325. The central medallion, showing a woman handing a helm to a kneeling knight, retains only minute traces of translucent enamel. The silver-gilt Swinburne Pyx (London, Victoria and Albert Museum M. 15–1950), 1310–25, originally covered with enamel, is now virtually uncolored: only vestiges of enamel occupy some areas of engraving.

Evidence suggests that by the mid-13th century the majority of English goldsmiths were laymen, working in large towns like London and York for both ecclesiastical and lay patrons. For some goldsmiths enameling was an integral part of their metalworking skills, but amid the increasing specialization of the Gothic period many worked exclusively as enamellers: in 1292 a Richard, “esmailleur de Londres,” is recorded as working in Paris. Ordinances of the goldsmiths’ guilds furnish further evidence of specialization and demonstrate the links established among types of goldsmith. The 1370 Ordinances of the London Goldsmiths place enamellers and seal engravers in one category, since their work involved many of the same skills. Close connections are also apparent between some enamellers and manuscript painters. For example, the designs on the Swinburne Pyx and in two contemporary East Anglian manuscripts (CUL Dd.4.17 and Cambridge, Corpus Christi College 53), are clearly derived from a common source.

Fig. 60. Dunstable Swan Jewel (London, British Museum MLA 1966, 7–3.1). Courtesy of the Trustees of the British Museum, London.

Extant pieces adequately demonstrate the competence of English Gothic

enamellers, but their work was largely influenced by technical developments occurring in France and Italy. Some Englishmen, such as Richard the Enameler, traveled abroad to gain expertise; others learned at first hand from continental goldsmiths working in England or from the quantities of enameled objects imported from metalworking centers like Limoges in southwest France. Thus objects like the Valence Casket (London, Victoria and Albert Museum 4–1865; [fig. 59](#)), ca. 1300, are difficult to localize. The heraldic decoration on this jewel or trinket box confirms its production for either Aymer de Valence (d. 1324) or his father, William (d. 1296), both of them English noblemen. The *champlevé* technique and form, however, relate most closely to Limoges work. The casket may be English and much influenced by Limoges models or the handiwork of a Limoges goldsmith working in either France or England. Evidence that numerous Limoges objects were produced specifically for the English market is demonstrated by 40 or more surviving *châsses*, or reliquary caskets, dating from the late 12th and 13th centuries; they depict the martyrdom of St. Thomas Becket, archbishop of Canterbury (d. 1170), and were designed to contain his relics.

Champlevé enamel, which was preferred to the exclusion of virtually any other technique during the 12th century (the Romanesque period), became less popular during the Gothic period. Sturdy, base-metal objects decorated with bold armorial designs, such as the Valence Casket and numerous small shield-shaped ornaments for horse trappings, demonstrate that *champlevé* did not die out completely. It was largely eclipsed, however, by a new technique developed in France or Italy in the late 13th century. The earliest extant piece of *basse taille*, or translucent enamel, is on a chalice in the treasury of San Francesco, Assisi, made and signed by Guccio di Mannaia for Pope Nicholas IV (1288–92). The emergence of this technique, which is successful only on gold or silver and thus tends to be executed on a relatively small scale, coincided advantageously with a greater availability of precious metals and higher levels of wealth among the nobility and middle classes in western Europe. In addition it was ideally suited to the fluid naturalism of Gothic style, enabling the goldsmith to dispense with rigid metal divisions between adjacent fields of enamel that had dominated opaque *champlevé* work. Instead the gold or silver plaque was engraved or chased in low relief with a design, and then coated entirely with an extremely thin layer of translucent enamel. The transparency of the enamel enhanced the skill of the engraving beneath, casting areas of deep relief into shadow and highlighting areas of low relief.

The majority of extant English *basse taille* enamels are executed on silver, but occasional gold pieces survive, such as the Campion Hall Triptych (Oxford, Campion Hall, on loan to the Victoria and Albert Museum), ca. 1350. Objects decorated with *rouge cler*, a translucent red enamel, are an exception to this

general rule, as, for technical reasons, *rouge clerwas* used only on gold. A number of similar silver-gilt triptychs and diptychs, designed as devotional aids for wealthy lay individuals, survive from the 14th century (e.g., London, Victoria and Albert Museum M.544–1910, 217–1874, and M.545–1910). *Basse taille* provided the perfect technique for illustrating them on a miniature scale with popular scenes from the Life of the Virgin, the Passion, and saints' lives.

English *basse taille* enamels displaying purely secular subject matter are much rarer. A pendant case of the mid-14th century (London, Victoria and Albert Museum 218–1874) depicts scenes from a romance, possibly that of Sir Enyas and the *wodewose*, or wildman. The two paneled silver bands at the bell of the 12th-century Savernake Horn (London, British Museum MLA 1975, 4–1, 1), 1325–50, show a king, a bishop, and a forester surrounded by hunting dogs, forest animals, a unicorn, and a lion. The reserved, silver-gilt figures are set against grounds of translucent enamel. The silver-gilt, bell-shaped King John Cup (Borough Council of King's Lynn and West Norfolk), ca. 1340, also shows hunting and hawking scenes reserved against enameled grounds on the panels decorating its cover, cup, and foot (the present enamel is not original). This is the earliest surviving English medieval secular cup, and, although the exact nature of its royal connections is obscure, it represents an extremely lavish commission.

Technical advances made in the second half of the 14th century in Paris produced a new enameling technique, *email en ronde bosse*, or encrusted enamel. This involved covering gold or silver figures or objects engraved in high relief, or cast in the round, with a skin of opaque enamel. Superficial roughening of the metal's surface ensured that the enamel adhered firmly to it. Only two extant pieces can be tentatively identified as of English workmanship. The Dunstable Swan Jewel (London, British Museum MLA 1966, 7–3, I; [fig. 60](#)), ca. 1400, a small gold swan enameled in white *email en ronde bosse*, was designed as a livery badge, worn to denote its owner's allegiance. The reliquary of the Order of Sainte Esprit (Paris, Musée du Louvre), ca. 1410, decorated with encrusted enamel figures, was made for Joan of Navarre, Henry IV's second wife. This provenance, together with the presence of St. Edmund, king of the East Angles, makes it almost certainly English, perhaps London work.

Rare survivals like these back up the frequent descriptions in inventories of equally elaborate royal and noble commissions and testify to the enameling skills of English Gothic goldsmiths.

Estate Management

Lords expected their estates to provide both revenues and food for their household. In the 11th and early 12th centuries most lords, therefore, leased their estates (or manors) for a combination of goods (payments in kind) and money. The lessee would provide fixed sums of grain (e.g., 80 quarters of wheat, 120 quarters of barley, and 20 quarters of oats), a specified number of pigs, cheeses, and goods like honey or eels, plus a small cash sum. The system was inherently flexible, with the rent or “farm” varying from manor to manor and from year to year as the needs of the lord changed.

But there were serious problems with this system. Any extra profits, in years of good harvests, for example, would go into the hands of the lessee, not those of the lord. Some lessees did not pay rent on time, others wasted the property, cutting down trees and failing to manure the land. To combat this problem some monastic estates appointed monks as farmers or lessees. But this led to problems of a different nature, as the monk-farmer, living away from the monastery, acquired secular habits. When inflation hit around the turn of the 13th century, lords’ expenses increased while incomes remained fixed. Gradually, one by one, in the course of the 13th century both lay and ecclesiastical lords gave up leasing their estates in favor of direct management.

The success of direct management depended heavily on the competence of local officials (serjeants or reeves), who actually ran the estates, and the effectiveness of centralized supervision. The serjeant (usually a free man) or the reeve (usually a villein) was responsible for seeing that fields were plowed, sown, and then weeded, meadows mowed, buildings, carts, and other implements kept in good repair, and grain harvested and stored. In addition he was responsible for the livestock—from doves and geese to sheep, cows, and oxen—and expected to record the number that had died, been consumed or sold, or remained at the end of each year. His accounts were carefully scrutinized by the lord's auditors, who might refuse to accept any item, insisting, for example, that the serjeant had paid too high a wage or, conversely, had accepted too low a price for any sales.

But although the serjeant was in charge of the day-to-day running of the estate, major policy decisions were made by the lord or his steward. It was this central figure who decided whether the grain or stock produced on a manor should be sent to feed the household, whether it should be sold, or whether part of it should be sold and part saved for the household. Furthermore changes in the normal agricultural pattern—the introduction of such new crops as beans or the introduction of dairy cattle—would be initiated at the central level.

Agricultural policies differed from place to place. Along the coast in southern and eastern England (Sussex, Kent, Norfolk) grain was usually sown at a high rate of seed per acre; four bushels for wheat, five for barley, and six to eight for oats. Such dense sowing helped smother the weeds and led to higher yields per acre, even though the yields per seed often remained low. In addition many lords in these areas sowed legumes—peas, beans, or vetch—on land that would otherwise have lain fallow. These crops not only added nitrogen to the soil but provided forage for animals, so it was possible to keep larger flocks and herds. Lords took advantage of the high wool prices and the expansion of the overseas wool trade to increase the sheep flocks. Many of them also began to keep dairy cattle and either sold the cheese or leased the cows to a cheeseman.

Consequently in these areas direct demesne farming remained profitable right up to the 1370s. In contrast, in other parts of the country, few or no legumes were used and grain was sown at low seeding rates; one and a half to two bushels for wheat and two and a half to three for oats and barley, leading to low yields per acre. Faced with the need to feed an expanding population, the area under cultivation increased; marginal land and former pasture came under the plow. But without adequate pasture or supplementary forage, it was impossible to keep large flocks and herds. In some places the number of animals dwindled and with them the supply of manure. As a result the

productivity of some land diminished. In parts of the Midlands and northern England, by the 1320s, lords were forced to cut back the area under cultivation and were facing a reduction in revenues.

In the mid-14th century a series of crises shook people's faith in the advisability of direct management. Heavy rains in 1315 and 1316 destroyed much of the wheat, leading to an acute shortage of grain. In many places sheep died of disease. In 1319–21 cattle disease attacked all parts of the country, often wiping out cow and ox herds. Lords had either to restock or switch to using horses for plowing. The start of the Hundred Years War brought further problems, including disruption of the wool trade. At the same time the country faced a serious deflation.

Although some lords coped with these crises by exploiting nonagricultural sources of revenue, especially the sale of timber, others abandoned direct management in favor of leasing. The sharp drop in population after the Black Death added a new set of problems. Wages rose, despite the attempt of the Statute of Labourers to keep them down. Villeins often refused to carry out customary labor services, and lords had no option but to commute them into a money payment.

Uncertain what policy to pursue, lords leased out some of their manors and kept others in hand. But at the end of the 14th century, when deflation set in, leasing once more became the normal practice. Lords, however, still had to provision their households. Thus knightly families frequently kept at least one manor in hand to serve as a home farm. On the great ecclesiastical estates, rents, although expressed in money, were in practice often paid in kind. A lessee, for example, might be charged an annual rent of £10 but would meet his obligations by supplying grain or stock to the household. By the 15th century the system of estate management had thus come full circle.

Eton College

The college of Our Lady at Eton (Buckinghamshire) was founded by Henry VI in 1440. For twenty years it received royal patronage and papal and episcopal favors; when Henry was overthrown in 1461 its fortunes declined and it only narrowly escaped disbanding and annexation to St. George's, Windsor. Largely through the tenacity of the fourth provost, Westbury, it survived, though on a reduced scale, weathering the political upheavals of late-15th-century England and the religious upheaval of the Reformation.

Eton's 1440 foundation charter provided for a provost, ten fellows, four clerks, six choristers, a schoolmaster, 25 poor and indigent scholars, and 25 poor and infirm men. A secular college incorporating a school and almshouse, Eton was soon linked with Henry's Cambridge foundation, King's College, on the model of Wykeham's foundations of Winchester College and New College, Oxford.

William Wainfleet, master at Winchester, was appointed Eton's first schoolmaster, becoming provost by 1443. Revised statutes of Henry VI brought the educational element into greater prominence, providing for 70 scholars, ten fellows, ten chaplains, ten clerks, and sixteen choristers, but only thirteen almsmen. An usher was added to assist the master, fee-paying boarders were admitted, and free Latin grammar schooling was to be offered to an indefinite number of boys from anywhere in England. The scholarships were allocated on conditions similar to those at Winchester.

Henry VI forbade rival establishments within ten miles of Eton. The original schoolroom is still intact, but the earliest solid information about the school's organization and routine is found in the *Consuetudinarium* of 1560. Eton and Winchester, originally designed as feeder schools for their related university

colleges, were excepted, along with Oxford and Cambridge, from secularizing legislation under Henry VIII and Edward VI, as places where “yowth and good wyttes be educated and norysshed in vertue and laming.”

Eusebius (fl. 8th century)

An 8th-century Anglo-Saxon cleric and poet, Eusebius was the author of one of the collections of Latin *enigmata*, or riddles. His identity is uncertain. He has traditionally been associated with Hwætberht, abbot of Wearmouth-Jarrow and friend of Bede, based on Bede’s statement that Hwætberht was also known as Eusebius. Michael Lapidge, however, following Neil Wright, believes Eusebius to be a Southumbrian, otherwise unknown, based on the metrical and stylistic characteristics of the riddles, which emulate more closely the work of Aldhelm and Tatwine than that of Bede. That he finishes a collection of riddles written by Tatwine, archbishop of Canterbury, supports the theory.

Eusebius supplements Tatwine’s collection of 40 *enigmata* *With*. 60 of his own, bringing the total number up to 100, following the models of Symphosius and Aldhelm. It is generally agreed that Eusebius’s riddles, however, do not match the high style and intellect of Aldhelm, Tatwine, or Symphosius. He is ultimately unable to sustain the theological framework with which he begins and toward the end simply copies his sources.

While Eusebius could not rise to the model set by his predecessors, it may be that he did not share their vision. Aldhelm and Tatwine focus heavily on metrics. Moreover their collections contain several riddles dealing with articles of Christian worship, but only one or two pertaining to writing. In contrast not one of Eusebius’s riddles refers to the mass, but many show a great interest in

language. For Eusebius, perhaps a scribe writing within a closed monastic community, reading and writing provided the strongest link between divine and human. His collection contains eleven riddles related to the art of writing, language, and letters, with solutions that include speech, the letters of the alphabet, and writing implements. In addition, following Isidore of Seville, his nature riddles are concerned largely with how things are named. Perhaps the modern reader, expecting another Aldhelm or Tatwine, too hastily judges Eusebius's work against standards that do not obtain.

Exchequer and the Pipe Rolls

The exchequer was the greatest of the central offices of English government. Its function was to exact and disburse the revenue due to the king and to audit annually the accounts of the sheriffs and other bailiffs responsible for collection. These accounts were recorded on the pipe rolls.

The first certain reference to the exchequer comes around 1110. Before 1154 only one pipe roll survives, the roll for the accounts heard in the Michaelmas (29 September) term, 1130. From 1154 on there is an almost continuous annual series until their abolition in 1834. The pipe rolls and other exchequer records, together with the *Dialogue of the Exchequer*, reveal in detail how the exchequer worked. It usually sat at Westminster and was divided into two departments, the lower exchequer, or exchequer of receipt, where the money was received, and the upper exchequer, where the audits took place.

The chief officials were called the “barons.” The president, down to 1234, was the chief justiciar, and thereafter, the justiciarship having been abolished, the first place was taken by the treasurer of the exchequer. From the 13th century the exchequer’s seal, authenticating the letters sent to summon the sheriffs and other debtors to settle their accounts, was kept by the chancellor of the exchequer. Twice a year, before Easter and Michaelmas, the exchequer prepared and sent to the sheriffs “the summonses,” the lists of debts they were to collect and pay into the lower exchequer on the day after the close of Easter and on the day after Michaelmas.

In practice, by the 13th century, the bulk of the money was not received immediately on these days but came in gradually. The lower exchequer remained open for the receipt of cash through most of the year. This money was recorded on receipt rolls, of which there were two for each financial year, one beginning at Easter, the other at Michaelmas. As proof that the sheriff had indeed paid the money demanded, the exchequer gave him a tally stick, normally one for each individual debt. This was a stick with the amount of money paid in written along its left- and righthand side and then cut down the middle in a jagged line. The sheriff kept one half, the exchequer the other.

Every Michaelmas the sheriffs were summoned to account at the upper exchequer for all debts they had been ordered to pay since the audit of the previous financial year. By the 13th century hearing these accounts occupied the exchequer from Michaelmas through to the following summer. Each sheriff was taken in turn. He would sit with the barons of the exchequer around a table covered by a checkered cloth; from this cloth, resembling a chessboard (*scaccarium*), the exchequer derived its name. Separate columns were marked for pence, shillings, pounds, and twenties, hundreds, and thousands of pounds.

The amount outstanding from each debt was set out in counters. The sheriff proved how much he had paid in by producing his half of the tally stick to match with the half kept by the exchequer. Alternatively the sheriff could

show, by producing a warrant in the form of a writ, that he had spent a given sum on the king's orders. The amount of the debt discharged in either of these ways was likewise set up in counters and the process of subtraction became easy to follow.

The exchequer recorded the accounts thus heard on annual pipe rolls, each dated by the regnal year. The pipe roll that records the accounts heard between Michaelmas 1221 and 21 June 1222 is thus called the roll for the fifth year of King Henry III. The pipe roll was made up of a number of *rotuli* (sixteen in the roll for the fifth year of Henry III), each of which consisted of two membranes of sheepskin sewn together, the total length (in the 13th century) being around 5 feet and the width some 14 inches. These *rotuli* were sewn together at the top and rolled up to resemble a "pipe" (French), hence the name pipe roll. The Pipe Roll Society (founded 1884) has to date published all the rolls down to the fifth year of Henry III.

Alongside the pipe rolls the exchequer kept memoranda rolls, one begun at Michaelmas, one at Easter. These recorded, among other things, letters sent to and despatched by the exchequer, decisions of the barons, and pronouncements made at the exchequer by the king. The legal cases heard by the exchequer, which from the 13th century chiefly concerned disputes over debts, were recorded on the plea rolls of the exchequer.

The exchequer was also involved in disbursing the king's money. That paid into the lower exchequer was usually stored in a treasury over which the treasurer and chamberlains of the exchequer had control. The king was constantly sending letters (writs of *liberate*) that ordered these officials to pay out money for a wide variety of purposes. The sums disbursed were recorded on issue rolls, of which, again, one was begun at Easter, another at Michaelmas.

The origins of the exchequer are obscure. The first certain reference is from around 1110, but before that the kings must have had some means of auditing the money owed them. To what extent those means were less elaborate and sophisticated than the system revealed by the pipe roll of 1130 is hard to say. *The Dialogue of the Exchequer* preserves a memory of a central office of audit before the development of the exchequer cloth; it states that the words "at the exchequer" had once been "at the tallies."

In the 12th century the exchequer had been the only central office of government and had frequently combined its financial functions with those of a court, hearing a wide variety of judicial pleas. This ceased in the 1190s, when a separate judicial court, the Bench, was established at Westminster. The exchequer's financial work, meanwhile, became rapidly more burdensome and time-consuming. This was partly because the revenue with which it dealt was expanding; partly because that revenue came increasingly from numerous

small individual debts rather than from limited numbers of large sums derived from land.

The rolls of the exchequer multiplied in size until they became almost impossibly cumbersome. Efforts at reform were made in 1270 and in the 1320s, when “desperate” debts and other redundant items were removed from the pipe rolls. If, however, the exchequer was sometimes bypassed—with revenue being paid directly into the king’s wardrobe or chamber—it remained the chief financial institution of English government for the rest of the Middle Ages and beyond.

Excommunication

The severing of a Christian from the Christian community stands at the heart of excommunication. Other communities in medieval Europe exercised similar penalties; the imperial ban in Germany and outlawry in England were parallel procedures. For the church excommunication constituted the separation of an erring member from the communion of the faithful, the ultimate ecclesiastical penalty. The essential offence for which excommunication was imposed was contumacy—a hardening of the heart—against the very authority of the church.

Although specific crimes (e.g., the laying of violent hands on a cleric) provoked this penalty, it was the contumacy inherent in such a crime that justified this sentence.

The classical canonists from the late 12th century distinguished minor and major excommunication. The former could scarcely be called excommunication; it could be imposed and removed by a parish priest, and its consequences were the same as those for mortal sin (i.e., a separation from the eucharistic body of Christ). Major excommunication, whether imposed by law (*a iure*) or by an individual churchman (*ab homine*), and whether incurred *ipso facto* by the commission of a certain crime or by a judgment made after the fact of the crime, had the same effects: exclusion from Christian communion.

The excommunicate lost all religious rights; he suffered exclusion from entry into a church, from the social company of the faithful (even, in some instances, from his own family), from pleading in courts (secular as well as ecclesiastical), from holding an ecclesiastical benefice, and, in general, from all legitimate ecclesiastical acts. The penalty pursued him even after death by excluding his body from Christian burial. Excommunication, in effect, amounted to almost complete social ostracism.

The ceremony of excommunication by bell, book, and candle, although found in books of rituals, was seldom used. A study of over 16,000 excommunications in England reveals not one instance of the formal ceremony of anathema. Commonly the excommunicating official (e.g., an abbot, bishop, ecclesiastical judge) would simply say, "I excommunicate you" (*excommunico te*). Of course appeals were allowed and had the effect, in practice, of suspending sentences for a year. Intended as a medicinal penalty—to cure the offender—excommunication could be removed by the promise of obedience and penance. The Great Curse (a list of excommunicable offenses) was read four times a year in every parish church, and excommunicates were denounced from local pulpits.

Examples of the excommunication of kings (John in 1209) and of bishops (Robert Grosseteste of Lincoln in 1253) should not obscure the fact that in England, as elsewhere in Christendom, excommunication was routinely imposed on ordinary people. The study of English excommunicates shows that it was imposed, apparently without favor, on peasants and parsons, gentlemen and abbots, shoemakers and weavers, physicians and grocers; in fact on a representative cross-section of contemporary society.

If the medicine of excommunication failed to heal the criminal, the church could and frequently did invoke the aid of the secular arm to promote repentance. From the early 13th century a procedure existed whereby obdurate excommunicates, unabsolved for more than 40 days, were subject to arrest and imprisonment by the secular authority until absolved.

The Henrician Reformation changed neither the use of excommunication nor its consequences. The penalty and even the invocation of the secular arm continued throughout the 16th century and, in a diminishing degree, in later centuries.

Exemplum

A rhetorical and literary form. According to John of Garland (fl. 13th century) an exemplum is a statement or deed from some authoritative (*autentica*., also meaning "trustworthy" or "real") person worthy of imitation. The medieval term "exemplum" (plur. *exempla*) is not the same as "example" in the modern sense but had a broader application, whether used of evidence in argument or of a narrative and its attendant interpretation.

Aristotle described examples in rhetorical use as a kind of inductive reasoning (*Rhetoric* 2.20); they supplement maxims and logical argument (enthymemes) as evidence or can stand as arguments themselves. He divided examples into the historical and the invented and further distinguished two sorts of invented example, the illustrative parallel and the fiction. These ideas were transmitted through Roman rhetoricians to the Middle Ages, when the exemplum attained the status of a recognized literary form in itself in addition to its rhetorical function. Within a rhetorical context, such as a sermon, a notable statement or brief narrative could be adduced as evidence in support of an argument; such uses might not include any comment other than a tag like

“as _____ said” or “for example.” In other cases, especially when an argument was made from the exemplum, the author would take pains to interpret the statement or narrative according to his intention, thus yielding a two-part structure, statement/narrative plus interpretation.

Sources for the narratives in exempla were various—almost any work of human or natural history would serve, as could the imagination of the author, or very often an existing exemplum—and are now difficult to trace. The church preferred biblical and historical exemplary narratives and authoritative statements of Church Fathers; illustrative parallels (hypothetical actions of unnamed or typical characters or general conditions of life, such as the physical environment or the behavior of animals) were also frequent. Fictional exemplary narratives were subject to condemnation but were still used, especially beast fables. Modes of interpretation ranged from simple paraphrase to elaborate allegorical moralizations.

As a literary form exempla most often appear in collections and show the two-part, self-interpreting structure. Especially in the 13th and 14th centuries exempla were drawn from sermons and many other sources and compiled into collections of materials for preaching (such as John Bromyard’s *Summa praedicatorum* or the *Contes moralisés* of Nicholas Bozon), encyclopedic collections (such as the *Alphabetum narrationum* or *Speculum exemplorum*), and topical collections (such as collections of beast fables, the *Gesta Romanorum*, or even the *Ovide moralisé*). Such collections were usually composed in Latin and later translated into the vernacular; English translations often date from the 15th century (Caxton printed several).

Removed from rhetorical context and presented more for their own sake, exempla could be structurally manipulated. Authors could expand the interpretations, as in the figural expositions common in the *Gesta Romanorum*. Alternatively narratives could become longer and more complex, more attuned to literary ends, at the expense of the interpretive commentary: Chaucer’s *Nuns Priest’s Tale* has only a few lines of interpretation at the end of a 600-line narrative. Imbalances between the two parts of exemplum structure can make it difficult to decide whether a given medieval text ought to be called an exemplum or instead be relegated to religious commentary or to some other literary category.

Exeter

The Romans built a legionary fortress at Exeter, ca. A.D. 55–60, on a hill overlooking the lowest bridging point of the Exe River. The fortress soon became a town, called *Isca Dumnoniorum*, the capital of the Dumnonii, the native inhabitants of Devon and Cornwall.

In the 7th century a Saxon minster was founded; St. Boniface is known to have been educated at its monastery. By the end of the 9th century, when Alfred established a mint at Exeter, the city had become Wessex's major seaport and an important fortified *burh*. Trade with France and Ireland, as well as the central role it must have played as an exporter of tin mined on Dartmoor, was the basis of the city's 10th- and 11th-century prosperity. An indication of Exeter's growing status was the transfer of the episcopal see, from Crediton to Exeter, in 1050. Another mark of status was its privilege of

paying geld (tribute or tax) only when London, York, and Winchester did so. By 1068 Domesday Book records some 399 houses in Exeter; some 2,500 people lived in the town.

Orderic Vitalis described Exeter as a “wealthy and ancient city, strongly fortified” in his account of William the Conquerors siege of the city in 1068. Although the town walls resisted efforts to undermine them, the city eventually surrendered and William solidified his victory by building a royal casde on the highest point within the town, demolishing 48 houses in the process. William of Malmesbury described Norman Exeter as “magnificent and wealthy, abounding in every kind of merchandise.” This assessment was echoed in the city’s substantial contributions to 12th- and early-13th-century royal aids (taxes collected on special occasions, such as the marriage of the king’s eldest daughter) and tallages (arbitrary taxes levied on towns); Exeter ranked about sixth among English cities. But its fortunes declined in the 13th century, as it lost its prominence as a tin exporter and eastern towns and ports took a more dominant role in the cloth industry and export trade.

By 1334 Exeter ranked only 24th among English towns, according to the lay subsidy returns. In 1377, following the severe plagues of 1349 and 1361, the population of Exeter, including its western suburb of Exe Island, was about 3,000, placing it behind 21 other towns in size.

Throughout the 14th and early 15th centuries Exeter was noteworthy primarily as the regional capital of the southwestern peninsula, the seat of a bishopric that encompassed Devon and Cornwall, an administrative center for the king’s itinerant justices, and the region’s chief market town and seaport. In the mid- to late 15th century, however, Exeter’s fortunes rose once again, as the city was able to draw upon its expanding local and regional cloth industries, becoming one of the top exporters of cloth at the close of the Middle Ages and ranking as one of the richest towns in the early-modern period.

Exeter Bohun Psalter

Oxford, Exeter College 47, is one of a group of manuscripts commissioned by the Bohun family. The text of the Psalms is preceded by a calendar and followed by canticles, litany, *memoriae* to various saints, and, finally, Gospel sequences. Every page, whether or not it has a psalm initial, receives border decoration on all four margins of the text. This 127-folio volume has unfortunately been severely mutilated. Only the major frontispieces to Psalms 51 and 52, which occur on adjacent pages, survive (figs. 61–62). In all, the illustrations to 34 psalms are lacking.

A remarkable feature of this psalter (shared with the Bohun Psalter in Vienna [Vienna, Österreichische Nationalbibliothek 1826*] and the Bohun Psalter-Hours in the British Library [Egerton 3277]) is that every psalm receives historiation (cf. Cuerden Psalter). The frontispieces to the psalms and canticles form a connected iconographic series, unrelated to the text, which unfolds in an uninterrupted sequence of Old Testament narrative starting at the Creation and ending arbitrarily at the end of chapter 32 of the book of Numbers, at the point where Moses arrives at the River Jordan. It is possible to reconstruct the subject matter of the missing psalm pages by reference to the Bohun Psalter-Hours in Oxford (Bodl. Auct. D.4.4), but there the cycle is contained in miniatures and historiated initials at the principal psalm and hours divisions only. From the end of the canticles the iconography changes: the *memoriae* are illustrated by representations of the respective saints and the sequences of the Gospels likewise. Slender gold bars surround all pages of the text and at focal points develop cusped formations to accommo date a variety of foliage, flower, animal, and hybrid forms.

Fig. 61. Exeter Bohun Psalter (Oxford, Exeter College 47), fol. 33v. Psalm 51. Reproduced by permission of the Rector and Felbws of Exeter College, Oxford.

This psalter is more complex than it first appears. Whereas the text (except

the calendar) indicates that it was prepared in one campaign, stylistic and codicological evidence suggests that there were three separate programs of illumination, a factor that has an important bearing on the dating and ownership of the book, executed over a period of some 40 years. The work of five illuminators can be identified. One artist, contemporary with the writing of the text, illuminated all the one-line verse initials and line-fillers, as well as some of the borders in a single gathering. An additional artist, working at the same time, painted the historiated initials and remaining borders constituting the first campaign (fols. 20–77v). His style relates closely to that of the final work in the Vienna Psalter, undertaken sometime between 1350/55 and 1360. In both portions the figures are small and there is a tendency to make the heads overlarge for the bodies; the eyes are composed of narrow slits with black dots for the irises, and the majority of younger men have tiny moustaches with wispy beards.

Fig. 62. Exeter Bohun Psalter (Oxford, Exeter College 47), fol. 34. Psalm 52. Reproduced by permission of the Rector and Fellows of Exeter College, Oxford.

This same artist, at a later stage in his career, returned to the Exeter Psalter

but completed only folios 9–19v. This phase of the illuminators development, which is characterized by greater naturalism and softer modeling, relates stylistically to his work in Auct. D.4.4, a further Bohun Psalter (Cambridge, Fitzwilliam Museum 38–1950), the two Bohun manuscripts in Copenhagen (Royal Library Thott. 517.4° and Thott. 547.4°), and another in the collection of Graf von Schönborn in Pommersfelden (2934), works variously datable to between ca. 1370 and 1380, in which he continued to collaborate with the artist with whom he shared the first campaign in the Exeter Psalter.

The final seven gatherings (fols. 3–8 and 78–126v), in which three contemporary artists are discernible, were illuminated by a workshop employing different methods, the principal hand of which used the acanthus leaf, not utilized by the earlier illuminators, and monumental figures dressed in classical clinging draperies, clearly inspired by Italian forms. This artist also participated in Hatfield House, Hertfordshire CP 290, while his assistants in Exeter 47 are found working in two books of a London provenance, *Omne bonum* (BL Royal 6.E.vi and 6.E.vii) and a copy of William of Nottingham's Commentary on the Gospels (Bodl. Laud Misc. 165). These manuscripts, and other London-produced works to which they relate, suggest that by the date of the final campaign in Exeter 47 (ca. 1390–1400) the Bohun family were commissioning their books from the capital.

Documentary evidence survives that indicates that up until ca. 1385 the Bohuns had their own resident illuminators based at their castle at Pleshey, Essex, chief of whom was one John de Tye. This illuminator, whose origins are clearly English, though showing some Italian influence, participated in both first and second Exeter campaigns. His only collaborator in the psalter, and in the Bohun manuscripts produced between ca. 1350/55 and 1385, is of Flemish origin.

As to ownership the Exeter Psalter appears to have been worked on for three successive generations of the Bohun family, starting with Humphrey de Bohun (the name Humphrey occurs in the *memoriae*), the sixth earl. The project was probably halted by his death in 1361. It was continued for another member of the Bohun family between ca. 1380 and 1385, with the manuscript still at Pleshey. Some time in the last decade of the 14th century, when Eleanor de Bohun and her husband, Thomas of Woodstock, were involved in ordering other books from London-based illuminators, the psalter was completed, either for them or as a gift, by artists who were clearly pursuing a more commercial form of workshop practice that heralded developments of the early 15th century.

Exeter Book

The Exeter Book (Exeter Cathedral Library 3501, fols. 8–130) is a codex of OE poetry containing 123 folios (each ca. 12.2–12.5 by 8.6–8.9 inches). A preliminary quire (probably added in the 15th century but previously belonging to the manuscript of the West Saxon Gospels now CUL li.2.11) contains documentary material as well as a list of the books given to his cathedral at Exeter by Bishop Leofric in 1072, in which the Exeter Book itself is probably identifiable as “i great English book about all things, composed in verse.” The poetic contents may be divided into three “booklets” or self-contained textual units. The first contains long religious poems (*Christ I-III*, *Guthlac A, B*). The second contains elegies, category poems, allegorical and shorter religious poems (*Azarias*, *The Phoenix*, *Juliana*, *The Wanderer*, *The Gifts of Men*, *Precepts*, *The Seafarer*, *Vainglory*, *Widsith*, *The Fortunes of Men*, *Maxims I*, *The Order of the World*, *The Riming Poem*, *The Panther*, *The Whale*, and *The Partridge*, lines 1-2a). The third contains riddles, elegies, and short religious poems (*Homiletic Fragment III* = *The Partridge* lines 3–16, *Soul and Body II*, *Deor*, *Wulf and Eadwacer*, Riddles 1–59, *The Wifes Lament*, *Judgment Day I*, *Resignation A, B*, *The Descent into Hell*, *Almsgiving*, *Pharaoh*, *The Lord’s Prayer I*, *Homiletic Fragment II*, Riddle 30b and Riddle 60, *The Husbands Message*, *The Ruin*, and Riddles 61–95). The manuscript contains texts of all the known OE elegies. One text (*Soul and Body II*) also appears in the Vercelli

Book.

The poetic codex consisted of at least seventeen quires (the first sixteen of them, at least, consisting of eight folios) copied by a single scribe in the 10th century (ca. 950–70?), perhaps at Exeter itself, in a well-formed Anglo-Saxon Square Minuscule script. The same hand occurs in two Latin manuscripts: London, Lambeth Palace 149, fols. 1–138 (Bede, *Expositio super Apocalypsin*, and Augustine, *De adulterinis coniugiis*) and Bodleian Library, Bodley 319 (Isidore, *De fide catholica*). Both, like the Exeter Book, were also probably given (or confirmed) to his cathedral by Bishop Leofric. Lambeth 149 has a partly erased inscription on fol. 138v recording its previous gift in 1018 by an Ealdorman Æthelweard to an unidentified religious house dedicated to the Virgin Mary.

Paleographical features (such as the distribution of certain letter forms and ligatures), as well as differences in the quality and preparation of the leaves, suggest that the three textual booklets represent three separate stints of scribal production. The present first booklet (fols. 8–52v) may have been the last to be written, the second (fols. 53–97v) first, and the third (fols. 98–130v) second. The poems *Christ I–III* and *Guthlac A, B* may have been arranged in these sequences for the first time in their particular booklet, causing the scribe to modify parts of the texts to help the arrangement. Individual pages are written in 21 to 23 long lines, without illumination but with some use of embellished initials, capital script, and diminuendo at the beginning of items. Punctuation in ink is sparse, but some extra marks have been added in drypoint. Drypoint drawings of figures and patterns occur in some margins. The end of items is usually marked by a combination of punctuation marks, sometimes by Latin *Amen* or *Finit* and/or by the leaving of blank lines. Runic letters are found in the signatures of the poet Cynewulf and indicating the solution to some riddles (e.g., in Riddle 36, the H-rune stands for *Homo*); cryptic writing also occurs where consonants are placed instead of vowels.

A number of leaves (e.g., after fols. 37, 69, 73, 97, 105, 111), with consequent loss of text, were already missing in the late 16th century, when the volume was first foliated (being refoliated by 1705). Other leaves are damaged: for example, fols. 117–130 contain holes made by burning, fol. 8 has both been cut by a knife and stained by the base of a pot of liquid. Some of the damaged leaves have deteriorated further since 1832, when a facsimile transcript was made for the British Museum by Richard Chambers (BL Add. 9067); this was used by John Mitchell Kemble while preparing his second edition of *Beowulf* (1835–37) and possibly for the first edition (1833). The Exeter Book was consulted in the 16th century by the antiquaries John Joscelyn (for Matthew Parkers *A Testimonie of Antiquitie*, 1566) and Laurence Nowell; the latter added an interlinear English gloss to seven lines of *Christ I* on fol. 9, and four

lines on fol. 10. The manuscript was studied by George Hickes and Humfrey Wanley before 1705 and by Nikolai Frederik Severin Grundtvig in 1830.

Some poems from the Exeter Book were published with Latin and modern English translations by John Josias Conybeare in 1814 (*Archaeologia* 17) but the first comprehensive edition was by Benjamin Thorpe (*Codex Exoniensis*, London, 1842). Bindings are known to have been added in the 15th century and ca. 1700; the latter was removed in 1932 for the making of the photographic facsimile and was replaced by the present binding.

Exodus

A 590-line narrative poem preserved in Bodl. Junius 11 (copied ca. 1000–35), a volume devoted to OE biblical verse. Like other poems in Junius 11 *Exodus* has suffered textual loss from imperfect scribal transmission and from the direct removal of manuscript leaves; as originally composed, the poem probably had 690–740 lines. Scholars have differed widely on the date of the poems

composition, the estimates ranging from the late 7th century to the second half of the 10th. Although a majority of scholars over the years have favored an 8th-century date, today there seems little consensus. In large part the uncertainty reflects the debate over the dating of *Beowulf* with which *Exodus* shows affinities in meter, diction, formula, and the use of digressions.

In important ways, however, the poem is much different from *Beowulf*. *Exodus* is remarkable for its convoluted syntax, daring imagery, narrative obscurity, intense compression of meaning, and large number of words not elsewhere attested. Some scholars (e.g., Hill) believe the poet was influenced by Latin hermeneutic literature; others (e.g., Frank) suggest the influence of Old Norse skaldic verse. Another possibility is that the poet, perhaps influenced by both kinds of literature, took to an extreme tendencies inherent in OE verse itself.

Exodus is not a paraphrase but a free re-creation of the biblical account. Employing Anglo-Saxon heroic diction, the poet tells the story of the Israelites' release from Egyptian bondage, their journey to and crossing of the Red Sea, and the destruction of the pursuing Egyptians in the water. The poet's main source was the book of Exodus, especially chapters 13 and 14; but he shows familiarity with other biblical books, most notably Genesis (which he may have known in a version combining Vulgate and Old Latin readings). Apart from the Bible the poet's sources are uncertain. Scholars have pointed out nonscriptural parallels between *Exodus* and two other narrative accounts of the exodus: Josephus's *Jewish Antiquities*, book 2, and Avitus's *De transitu maris rubri*. Other scholars, however, have dismissed the parallels as inconclusive, and the attribution in either case remains controversial.

Also controversial are the nature and the extent of the poet's reliance on Christian Latin exegesis, particularly the symbolic reading of scripture prominent in most commentaries. That the poet was concerned with the symbolic dimension is clear: unlike other OE biblical poets he expressly refers to the desirability of unlocking scripture with *gastes cagon*, "keys of the spirit," then characterizes life on earth as a period of exile from which the Lord will one day lead the faithful to heaven (lines 523–48). Accordingly, several scholars have sought to explain the poem's ambiguities and "unrealistic collocations" (Cross and Tucker) by reference to Christian symbolism. Yet others have rejected this approach as often unwarranted, arguing that *Exodus* should be read primarily on the literal or historical level. All scholars would agree, however, that no single approach can solve all the problems of interpretation. If the poet, in pondering and celebrating the early history of Israel, aimed to compose a challenging poem, he succeeded almost too well.

F

Faburden

A distinctive English musical technique in which a simple form of three-voice polyphony is created by the addition of two extemporized voices to a preexistent plainsong. The term may also refer to the whole complex of voices, or simply to the faburden proper, the lowest voice, from which the technique takes its name. In this technique the plainsong voice, or mean (because musically it is in the middle), is doubled at the fourth above by the treble. The bass part, or faburden, proceeds mainly at the third below the chant, singing a fifth beneath at the beginning and end, and at the ends of words. Harmonically speaking, the result is a chain of parallel 6/3 sonorities, bounded and inflected by 8/5 sonorities. Continental “fauxbourdon” derives philologically and in terms of sonorous ideal (though not in the details of practice) from English faburden.

The technique of faburden seems to have been codified early in the first quarter of the 15th century, though its roots go back about two centuries in both oral tradition and in a repertoire of unpretentious three-voice written polyphony for the liturgy. It is particularly associated with the performance of lengthy processional and antiphonal choral chants, such as hymns, litanies, processional psalms, the Te Deum, and the Magnificat. Though a single faburdener could invent a new faburden for each performance, in practice (especially if several voices were to sing the line) a version would come to be fixed in a choir's repertoire. For reference purposes these traditional faburdens were copied into collections of monophonic bass parts, and they were also added into chant manuscripts as dots, strokes, or plainsong symbols directly on the same staves as the plainsong. Faburdens were also potentially squares; that is, some were incorporated as a *cantus prius factus* (preexistent melody used as a structural basis) into more elaborately composed polyphony of the later 15th and 16th centuries, said then to be “on the faburden.”

Faburden was taught to boys and singing men as one of the fundamental skills that singers of the liturgy had to have. It is described in a number of 15th- and 16th-century treatises in English (rather than Latin) so as to be

particularly accessible to this audience.

Fairs and Markets

Fairs and markets provided structure and organization for most commercial activity by furnishing traders with secure surroundings, access to a steady stream of customers, quick justice under law merchant (the common law adapted for on-the-spot settlement of commercial disputes) when problems arose, and facilities and services for storage, transport, and display.

The owners of fairs and markets, who by the early 13th century were required to obtain a royal charter to start a fair or market, profited from rents on stalls, tolls from buyers and sellers, and fines arising from the jurisdiction of market courts. Well over 3,000 market charters were granted to lay and ecclesiastical lords during the 13th century in response to rising local demand fueled by population growth and an expanding economy. This pace slowed considerably in the 14th century; few fairs and markets were founded after the Black Death (1348–49), and some disappeared altogether as population stagnated, private trade increased, and certain urban markets grew more dominant at the expense of fairs and village markets.

Fairs and markets differed primarily in timing. Fairs were annual events, normally held for about three days around the feast of a locally prominent saint. Most fairs took place in towns and attracted buyers and sellers from the surrounding region. Some were international in scope, concentrating largely on wholesale trade. Those at Stamford, St. Ives, Boston, and Winchester were particularly important, lasting up to four weeks and drawing merchants from

throughout northern Europe.

The heyday of international fairs was from the late 12th through the early 13th century, when England's wool and cloth were in demand throughout Europe. By the end of the 13th century, however, these great fairs were in decline, as foreign merchants, as well as many English merchants who traveled long distances, ceased to attend. Various factors were responsible for this decline: changes in the cloth industry that dispersed the production and marketing of cloth; wars with Flanders and France that disrupted trade; alterations in the customs and staple systems that allowed traders to bypass fairs; the growing pull of London commerce.

Unlike fairs markets were held on a weekly basis and attracted primarily local residents who concentrated on retail trade and the supply of foodstuffs and household items. The larger towns held markets three days a week (six in the case of London); most places possessed a once-weekly market. Urban marketplaces were held in large open spaces where visiting peasants and petty retailers could display goods on payment of a small fee. Many cities also built market halls to protect traders from bad weather and to provide separate facilities for specialty items like cloth, hides, and furs. Bordering the marketplace were shops, stalls, and warehouses, rented out to local merchants and artisans. In contrast village marketplaces often occupied only a small widening in the main street where a few peasants, traveling chapmen, and some local residents might gather for a half-day once a week to conduct trade in basic foodstuffs and small wares.

Family Letter Collections

There are four major collections of letters and papers of English families. In order of size and therefore of importance that of the Paston family of Paston and Oxnead, Norfolk, comes first by a wide margin. Well over 1,000 letters and other documents survive for the 15th century alone. They cover the family's rise from lowly farming origins to their acceptance into the county elite after the Battle of Bosworth (1485).

The fortunes of the Pastons were established by judge William Paston's hugely successful legal career; he purchased many properties in Norfolk, mainly in the northeast of the county where Paston lies; Oxnead was one of these estates, Gresham another. Many of the deals William made were decidedly shady. His eldest son, John, succeeded him in 1444. William had procured for John in the 1430s a bride, Margaret Mautby, who was of an impeccable Norfolk family and heiress to nine East Anglian manors. John was the epitome of an English gentleman: mean and grasping. Typically he overreached himself. His attempt to obtain the estates of his patron and employer, Sir John Fastolf of Caister, Norfolk, on Fastolf's death in 1459 failed dismally, and he died (possibly in jail in London) in 1466, fatally eroded by uncompromising greed.

The bulk of the collection of letters concerns this affair of Fastolf's will. John was usually in London, Margaret in Norfolk. After her husband's death she did not remarry but lived at her family home at Mautby; her two sons, John II and John III, were more often in London and Calais than Norfolk. Letters passed between mother and sons regularly until Margaret's death in 1484. Thereafter they tail off; John II had died a bachelor in 1479, his brother, now head of the family, in 1504. Though the letters are an unparalleled source for 15th-century English history, their great number and some serious problems of interpretation (many of them are long, and individual letters often touch on a wide variety of topics) mean that they have not been as thoroughly mined as their importance would call for.

The second collection, that of the Stonor family of Stonor, Oxfordshire, has been even more neglected. Although a study of the Stonors of the 15th century would be an easier undertaking than that of the Pastons, it has not been attempted. This is curious. There are no more than 350 published letters and associated papers, superbly edited by C.L. Kingsford. There is also a wealth of unpublished but readily accessible estate material. Moreover the Stonor menfolk were of a less self-serving and acquisitive temperament than the Pastons. This is probably because they had been accepted members of the "open" society of the mid-Thames valley since judge John Stonor had established the family there in the first half of the 14th century.

Sir William Stonor (d. 1494) is the last of the three generations that the collection covers. He is an attractive character whose Yorkist allegiance led

him into rebellion against Richard III in October 1483. His first wife, Elizabeth Ryche, was also an engaging and lively person. The widow of a mercer, she brought London ways to rural Stonor. The Stonors are invaluable for suggesting another perspective on English upper-class life to that offered by the Pastons: harmony rather than discord.

The third collection returns us to disharmony, but in the case of the Plumptons of the West Riding of Yorkshire it is self-inflicted. A Letter Book and a Coucher Book survive from the early 17th century, where in the first case letters, and in the second charters, deeds, and “official” correspondence from the 15th and early 16th centuries were transcribed. There are over 250 letters: 180 of them are addressed to Sir Robert Plumpton in the period 1480–1520. Sir Robert, the legitimized heir-male, spent much of his adult life fending off the claims of the heirs-general, his two stepnieces, and their influential and predatory supporters. It is a stirring and highly instructive story. In addition the collection provides a unique source for northern history in the 30 years either side of 1500.

The fourth collection is that of the Cely family. The Celys were Londoners, active in the wool trade. There are almost 250 published letters of the 1470s and 1480s, plus a large archive of business papers. It is from the letters and the commercial documents of this family that most of our knowledge of the workings of the trade in English wool is derived.

Fathers of the Church (Western)

A term applied to influential Christian writers of the first several centuries after Christ, many of whom also held important positions within the church hierarchy. Through both their written work and their activity within the church they have played a major role in shaping Christianity as it developed from the time of Christ and the apostles. Church Fathers are also referred to as Doctors of the Church and as patristic writers, and study of their work is known as patristics. Patristic writing typically includes theological treatises, biblical commentaries, sermons, letters, apologetic treatises (explanations and justifications of Christianity), polemics against heretical or non-Christian positions, saints' lives, and other work.

In the western, or Latin, church (the branch of Christianity that looked to Rome rather than the Greek-speaking Byzantine church for leadership) the

most important patristic writers are usually identified as Ambrose of Milan, Augustine of Hippo, Pope Gregory the Great, and Jerome. Augustine and Gregory are generally seen as the most significant, especially for England, followed by Jerome and Ambrose, but they will be presented in chronological order in the following article.

Ambrose of Milan (ca. 339–397)

Bishop of Milan from 374 to 397. Through his writings many patristic traditions were fostered and communicated to the Middle Ages and affected many aspects of medieval religious, artistic, and social life. Ambrose could read Greek and was a vehicle for the transmission of eastern thought to the West, notably the teachings of Origen and the Alexandrian school, and Basil and the Cappadocian Fathers. Ambrose's reading of scripture was characterized by allegorical interpretation after the manner of many eastern exegetes. Ambrose was also remembered as a powerful supporter of ecclesiastical authority and as the man who converted and baptized Augustine of Hippo in 387.

Some of Ambrose's writings were available early in Anglo-Saxon England; others arrived a century or more after the Roman mission of 597. Ambrose's *Commentary on Luke* was used by the author of the *Anonymous Life of Cuthbert*, which is one of the earliest surviving English writings. Bede (7th-8th century) and his contemporaries admired Ambrose's learning and piety and used his works as resources and points of departure for their own projects. The English bishop Acca of Hexham encouraged Bede to undertake a commentary on Luke, a difficult work that "had been taken up earlier by that most learned and most holy priest Ambrose." Bede, desiring to "follow the footsteps of the Fathers," acknowledges Ambrose frequently, drawing on Ambrose's exegetical homilies for his own and on the *Hexaemeron* (a commentary on the six days of Creation) as a source of information for his treatise *De natura rerum*. According to Cuthbert, Bede's friend and fellow scholar, Bede on his deathbed often quoted Ambrose's saying, "I have not lived so that I am ashamed to live among you, and I do not fear to die for God is gracious." Ambrose is also included in the prose *De virginitate* among the Church Fathers selected by Aldhelm as exemplars of chaste life, and Aldhelm may have drawn on Ambrose's treatises on virginity for this work. Ambrose's Latin hymns and several hymns attributed to him were quoted and used in Anglo-Saxon England.

Although the degree of patristic influence on vernacular poetry has long

been debated, Ambrose's teachings appear to have been communicated to the English through this medium. The cosmological configuration in Cædmon's Hymn, for example, has been traced through Bede to the first section of Ambrose's *Hexaemeron*, and the second part of the Exeter Books *The Phoenix* contains an allegory of the Resurrection that was probably based on the *Hexaemeron* 5.23. Similarly the end of the Cynewulfian poem *Elene*, suggesting the Judgment Day, appears to be based on Ambrose.

Jerome (347–419/20)

Greek and Hebrew scholar, translator of the Bible, exegete, and polemicist. Born in Dalmatia, Jerome studied under the grammarian Donatus in Rome. From 372 on he lived in the East, except for a short second visit to Rome (382–85). In the East he learned Greek and Hebrew, was ordained a priest, founded a monastery in Bethlehem, and devoted his life to asceticism and study of the Bible. His writings were points of reference on biblical topics, but they affected a wide range of intellectual pursuits in the Middle Ages. His Latin Vulgate translation of the Bible became the standard in medieval Europe, and he composed many other influential translations, treatises, commentaries, homilies, saints' lives, polemics, letters, and continuations of Greek reference works. His *Liber de situ et nominibus locorum Hebraicorum* (*On the Site and Names of Hebrew Places*) is a translation and continuation of Eusebius's *Onomasticon*. He also continued Eusebius's *Chronicle* and helped set a literary precedent for the Middle Ages to relate contemporary events to Christian ideas of the scope of eternity.

Although Christian Britain was for Jerome "a world apart" (*Epistle* 46.10), his writings were instrumental in the reconversion of the island after the Anglo-Saxon invasions. In addition to the Vulgate several of his works had a distinctive presence in Anglo-Saxon England. His correspondence with Pope Damasus was among the writings that Augustine of Canterbury brought with him to England. Aldhelm's prose treatise *De virginitate* reveals the influence of a large number of early Christian writings, including Jerome's *Life of [the Monk] Malchus*. Aldhelm, Bede, and Alcuin made much use of the linguistic, geographical, and scientific information contained in Jerome's treatises, particularly those on the meaning and interpretation of Hebrew names. They also used many of Jerome's letters and commentaries on the minor prophets. Although on the whole Bede cites Augustine more than any other patristic author, in his commentaries *In Marcum* and *In Lucam* he cites Jerome from a variety of sources far more frequently than he does even Augustine. Bede drew

on Jerome's *Chronicle* for his *De temporum ratione* (*On the Reckoning of Time*) and mentions and quotes from Jerome in his commentary on the Acts of the Apostles.

An incident described in a passage from Jerome's *Life of St. Paul [the Hermit]* is the only nonbiblical subject depicted on the principal panels of the Ruthwell Cross. Jerome's influence is also noticeable in OE vernacular literature. The English homilist Ælfric cites Jerome in his *Lives of the Saints* (a third series of homilies), and his other homilies are modeled on those of Jerome and other patristic authors. The Alfredian version of St. Augustine's *Soliloquies* is supplemented by passages from Jerome's commentary on Luke.

Augustine of Hippo (354–430)

Bishop of Hippo from 396 on; probably the most influential Christian writer after St. Paul, not only for the Middle Ages but also for the Protestant Reformation. Augustine was born of a pagan father and a Christian mother in Tagaste, North Africa. He studied at Madaura and Carthage and later taught in Tagaste, Carthage, and Rome. He became professor of rhetoric in Milan and was baptized there by St. Ambrose in 387. The following year he returned to North Africa. For four years he lived a semimonastic life but in 391 was ordained a priest and in 396 consecrated bishop of Hippo. Augustine's numerous writings reflect a powerful intellect and deep emotional insight. He debated the Manicheans, a sect to which he had once belonged, and later, having gained a reputation as a leading theologian and polemicist, he refuted the Donatists and Pelagians. His most important theological work is the *De Trinitate* (*On the Trinity*). Of major importance are the *Confessions*, a deeply personal reflection on divine glory and human weakness; *The City of God*, a grand-scale Christian "apology" presented as a reflection on history and divine Providence; and the *De doctrina christiana* (*On Christian Doctrine*), a treatise on the proper way to understand scripture. He also wrote scriptural commentaries, sermons, and letters. The direct impact of these writings on the Latin West was enhanced by the indirect influence of numerous intermediaries who propounded Augustinian ideas. In this group are included Eucherius of Lyon, Boethius, Caesarius of Arles, Prosper of Aquitaine, and Cassiodorus.

Augustine's theology and his theories of human nature were in the forefront of medieval English consciousness, and his teachings had a pervasive influence on Anglo-Saxon culture. Many of his works were known firsthand. *The City of God* is known to have been of major significance, although relatively few English manuscripts have survived. Other popular works were the *De*

Trinitate, the *Enarrationes in Psalmos* and other exegetical commentaries, and numerous sermons. Among influential English writers Bede in particular was on intimate terms with Augustine's works. His knowledge of Augustine includes at least eighteen works and surpasses his familiarity with Ambrose, Gregory, or Jerome. He employed Augustine's commentaries and homilies for his own writings in these genres. He quotes Augustine in his correspondence, as in the letter to Helmwaldum, which includes a lengthy passage from *De Trinitate*. Bede admits that he derived much of the substance of his *Catholic Letters* from the homilies of Augustine, particularly the *Tractatus X in Joannis epistolam*. The *Chronica minora* (chapters 17–22 of *De temporibus*) contains strong echoes of Augustine's *De Trinitate*. Bede's *Martyrologium*, verse *Life of Cuthbert*, and *De natura rerum*, as well as the verse *Death Song* sometimes attributed to him all show profound influence by Augustine. Bede claimed that his *Retractatio* was modeled after Augustine's.

Augustine's thought penetrated Anglo-Latin literature in a secondary manner as well. Alcuin based his discourse on the Trinity, *De anima ratione*, on Augustine's *De Trinitate*. Alcuin reflects Augustine's theology of the Trinity in his letters and in other places where he presents trinitarian analogues (like thought, word, deed). Augustine's teachings were also strongly represented in the curriculum of the monastic schools. Besides transmitting Augustinian exegesis and theology English churchmen like Bede and those who followed him were instrumental in communicating Augustinian perspectives into the general culture, including his literary theory and penchant for allegory. Aldhelm, for example, communicated Augustinian poetic theory to the English through such works as his Latin riddle *Lorica*, "iron breastplate," which was probably intended as a spiritual symbol. This poem was early translated into English. Alcuin, in his *De rhetorica*, echoes Augustine's distinction (from *De doctrina*) between "use" and "enjoyment" of literature, wherein literary art is considered something not so much to be enjoyed in itself as to be used as a means of enjoying God.

Scholars have long recognized the pervasive influence of Augustinian thought on OE vernacular literature. Augustine's *Soliloquies* were translated into English, possibly by Alfred. Some doubt exists that Alfred himself translated this work (neither Asser's *Life of King Alfred* nor the Anglo-Saxon Chronicle lists it among Alfred's writings), but internal evidence satisfies most scholars that the work is Alfred's own. In any case the OE *Soliloquies* provides strong testimony to the strength of patristic, and especially Augustinian, influence on Alfred. The OE version includes passages from other works of Augustine, Gregory, and Jerome. Book 3, for example, is based on Augustine's *De videndo Deo* (*Epistle* 147) and is supplemented by passages from Gregory's *Moralia in Job*, the *Dialogues*, and Jerome's *Commentary on Luke*. Ælfric

names Augustine as a major source for his *Catholic Homilies*. The *Lives of Saints* (a third series of homilies by Ælfric) cites Augustine frequently, and the trinitarian interpretation of the first chapters of Genesis in Ælfric's *Heptateuch* shows Augustinian influence.

OE poetry also reflects the efforts of writers to take extra pains to point out exegetical commonplaces derived from Augustine. The understanding of time and space that guides Cædmon's Hymn, for example, has been traced to Augustine's discussion of this subject in book 9 of the *Confessions*. The OE *Wanderer* has been interpreted as a meditative poem in the strict tradition of meditative exercises begun by St. Augustine. The poem speaks of the three powers of mind as Augustine does in *De Trinitate*. Similarly some scholars see Augustine's influence on the theological implications of *Genesis B*, an Old Saxon poem that was translated into OE. This poem may have been intended to show that covert evil can defeat the most wary of men if they lack grace. *Christ III* has been considered "a tissue of poeticized material from Gregory, Augustine, Caesarius of Arles, and others." As with Anglo-Latin literature the Augustinian literary aesthetic is also communicated in OE poetry. Examples of the application of the principles of *De doctrina christiana* can be found in the *Advent Lyrics* of the Exeter Book.

Gregory the Great (ca. 540–604)

Prefect of Rome, born of a wealthy family and the first monk to become pope (590). Gregory was the motivating force behind the reconversion of Britain after the Anglo-Saxon invasions. His efforts to strengthen the presence of Christianity in western Europe and to spread monastic culture included Augustine of Canterbury's mission to the Anglo-Saxons, which arrived in southern England in 597. The well-known pun on the tribal name *Anglias angeli* (Angles/angels), referred to as a legend in Bede's *Ecclesiastical History* 2.1, suggests his fondness for that nation. Not only had he encountered Anglo-Saxons in Rome, he became convinced that the English "were eager for conversion" (*Epistle* 6.49). Some of the correspondence between Augustine of Canterbury and Gregory is extant and provides an insight into Gregory's missionary policy, which was wisely tolerant. This is evidenced by his instructions to the missionaries, as reported in the *Ecclesiastical History* 1.30, to transform rather than destroy English shrines and customs.

Gregory never visited England, although he did travel to Constantinople in 578 as representative of his papal predecessor, Pelagius II. While in Constantinople he began his famous commentary on the book of Job, the

Moralia or *Expositio in Job*. After his return to Rome in 585 he lived as a monk but was elected pope in 590. His writings include extensive treatment of scripture in sermons and commentaries that are characterized by allegorical interpretation. His *Dialogues* and the *Regula pastoralis* are especially important. A copy of the *Regula* may have made its way to England with the mission of Augustine, and the *Moralia* and *Dialogues* were available early. Gregory's homilies also had considerable influence on English homilists from Bede on. Gregory's writings in fact provided one of the principal ways in which patristic ecclesiology and exegesis were incorporated into Anglo-Saxon culture.

Gregory, a model saint for the Anglo-Saxons, is mentioned and quoted frequently. Anglo-Latin literature from the earliest times contains testimony to the reverence the English had for him. The earliest life of Gregory is the *Vita antiquissima sancti Gregorii*, based on Gregory's own *Dialogues*. The *Vita* is preserved in a single manuscript now at St. Gall. Its author was probably a monk of Whitby in northern England. In addition to the Saxon life, as that version is commonly known, another important life of Gregory is found in book 2 of the *Ecclesiastical History*, which disagrees in some details from the *Vita antiquissima*. Bede was profoundly influenced by Gregory's character and universal vision of the church. The account of his life occupies more space in the *Ecclesiastical History* than does that of any English king. *Ecclesiastical History* 2.1 even presents a verse epitaph to Gregory. Bede knew several of Gregory's writings firsthand and identifies Gregory as the source of individual quotations. He recommended the *Regula* to Ecgbert of York and quotes from it in the *Ecclesiastical History*. He also includes a tribute to Gregory in book 6 of the commentary *In Cantica canticorum* (*On the Song of Songs*).

Felix of Crowland's *Life of St. Guthlac* (ca. 740–50), particularly the account of the author's visit to the saint, is inspired by Gregory's *Dialogues*. In addition the apocalypses or visions of Fursey the Irish hermit, preserved in an anonymous version and in the *Ecclesiastical History* 3.19, and of Drythelm (*Ecclesiastical History* 5.12) owe their origin largely to the *Dialogues*. Aldhelm was also deeply influenced by Gregory's writings. He drew on them extensively, for example, for his treatises on virginity. Alcuin shared with Bede a deep reverence for the *Regula* and recommended it to Eanbald of York for frequent reading by preachers and pastors.

Gregory's writings also have a prominent place in the vernacular tradition. The corrected version of the *Regula pastoralis* was one of the first works to be translated from the Latin into OE by King Alfred, presumably with help. In the preface to this translation the king treats of numerous themes touching on the search for wisdom and the state of learning in England. In a second verse preface the king includes a passage in alliterative verse containing a tribute to

Gregory as “Christ’s warrior, the pope of Rome.” The West Saxon translation of the *Dialogues* by Bishop Wærferth of Worcester owed its inspiration directly to Alfred, and passages from the *Moralia* supplement the OE version of the *Soliloquies* of Augustine of Hippo. Vernacular homilies also show Gregory’s influence. English hagiographical literature in particular owes much to him. Ælfric devoted part of his second series of sermons to the foundation of the English church under Gregory. Ælfric’s *Lives of Saints*, a third series of homilies composed by the most popular Anglo-Saxon homilist, is more indebted to Gregory than to any other author.

Just as English clerics who knew the pope’s exegetical writings imparted his teachings to their audience in their homilies, poets often drew on Gregorian exegetical traditions. The poem known as *Christ II*, contained in the Exeter Book, has as its principal source the conclusion of Gregory’s homily on the Ascension (Hom. 29). Similarly *The Gifts of Men*, also in the Exeter Book, appears to have this same Ascension homily as an indirect source.

Feasts, New Liturgical

The idea of new liturgical feasts presupposes a generally accepted calendar of observances. Though there was never in medieval England a single uniformly followed liturgical calendar, from roughly the beginning of the 13th century awareness of new feasts as an identifiable phenomenon becomes widespread.

Such feasts are of two kinds, of individuals and of occasions or more abstract devotions. Notable among those of individuals are the feasts of Thomas Becket (29 December), almost universally observed following his canonization in 1173, and of three English bishops canonized in the 13th century: Edmund Rich of Abingdon, archbishop of Canterbury (16 November; d. 1240); Richard Wych, bishop of Chichester (3 April; d. 1253); and Thomas Cantilupe, bishop of Hereford (2 October; d. 1282). The 14th century was less productive of new feasts of this kind (Anne, mother of the Virgin Mary, at 26 July is an important exception, though observed sporadically earlier), and the 15th is marked by the retrospective popularity of several figures from the Anglo-Saxon or British past—notably David of Wales (1 March), Chad of Lichfield (2 March), John of Beverley (7 May), Frideswide of Oxford (19 October), Winefride of Holywell (3 November)—as well as of Osmund (4 December), the first Norman bishop of Salisbury (Old Sarum). Only the first and last among these were officially canonized.

Not all of these saints' feasts were observed in all English churches, despite various enactments by the Convocations of Canterbury or York or by individual diocesan synods; in places where they were observed, a translation feast was also sometimes celebrated, marking the moving of a saint's body to a

new burial site or shrine. Of course many other new figures can also be found introduced into one calendar or another.

The same lack of uniformity is evident in the introduction of feasts commemorating occasions or devotions. The most widespread, as well as earliest, is that of Corpus Christi, found in many English service books from the early 14th century on. In the later Middle Ages three new feasts come to be regarded as specially important, sometimes to the extent of having the liturgical forms developed for them produced in pamphlets called simply *nova festa*. These are the Transfiguration (6 August), which has a very long history but comes to be generally observed only from 1457, following a papal decree of thanksgiving for a notable defeat of the Turks; the Visitation (of the Virgin Mary to Elizabeth; 2 July), which arose in the context of efforts to end the late-14th-century Great Schism; and the Name of Jesus or Holy Name (7 August), which emerges from being a popular private devotion to widespread liturgical celebration only by the early 16th century.

Other new feasts starting to gain popularity toward the end of the Middle Ages include the Five Wounds (which, however, never had a date attached), the Crown of Thorns (occasionally found on 4 May), the Compassion of the Virgin (no date at all widely observed), and her Presentation (21 November), which actually goes back to an 11th-century feast called the Oblation of the Virgin but gained new popularity in the late 14th century.

Because complete liturgical uniformity comes into being only with the Reformation and Counter-Reformation (abetted by the technology of printing), caution is necessary in dealing with new feasts in the Middle Ages. No blanket statement can be made about the spread of any particular feast until the widest possible range of evidence for its actual observance has been examined.

Felix of Crowland (fl. ca. 740–50)

Author of the Latin *Life of St. Guthlac* (*Vita sancti Guthlaci*), the only piece of historical writing to have come down from early Mercia. By the time of Guthlac's birth (ca. 674) Æthelred was already king. Guthlac's ancestry is traced back through Mercian genealogy to Icel, five generations before Penda, and his name to a family famed in legend, the Guthlacingas. His parents, Penwalh (or Penwald) and Tette, are otherwise unknown.

After a successful career as a leader on the western borders of Mercia Guthlac suddenly turned to religious life at the age of 24, first at Repton Abbey under the direction of Abbess Ælfthryth and later in the empty fens. Like the desert Fathers he counseled many, drawn to Crowland by his reputation; Æthelbald, future king of Mercia, often visited him there. Felix's *Life* is also the source of our knowledge of Guthlac's sister Pege, a hermit who lived in Peakirk, Northamptonshire. The Anglo-Saxon Chronicle gives Guthlac's death as occurring in 714, a date consistent with Felix's account.

Felix wrote up Guthlac's life in the 740s for King Ælfwald of East Anglia. There is, however, no need to assume that Felix was East Anglian, given that Ælfwald's predecessor's daughter was abbess of Repton during Guthlac's later years at Crowland. A particularly fine section of the *Life* tells of Guthlac's arrival at Crowland on St. Bartholomew's Day; his temptation to despair, from which he is saved by the appearance and teaching of Bartholomew; and his deliverance at the gates of hell through Bartholomew's intervention.

The *Life* is a polished piece of writing, indebted to well-established hagiographical conventions, especially in the deathbed scene, where it is similar to Evagrius's life of Anthony and Bede's life of Cuthbert. Stylistically Felix also owes much to Aldhelm. Nothing is known of Felix beyond his own identification of himself as someone in orders. There is no evidence to support the traditional assumption that he was a monk of Crowland and none indeed for organized monastic life at Crowland before Thurketyl's abbey in the 970s.

Feudalism

There are two definitions of feudalism, and historians do not agree which is to be preferred. One, generally favored by continental historians, encompasses nearly every medieval society from the 9th to the 12th century by identifying as feudal characteristics a subject peasantry, the supremacy of a class of specialized warriors, and ties of obedience that bind man to man, intertwined with other forms of associations, such as family and state.

Historians of England have tended to favor a narrower definition, focusing on military tenure and exactly defined contractual relationships, with one noble owing military service to another. In this relationship a noble, the "lord," grants the hereditary use of a piece of land, the "fief," to another noble, the "vassal." In return the vassal pledges particular military obligations to his lord. This agreement had the binding power of a contract, and to ensure that both parties honored their obligations a system of private courts was created. Discussions of English feudalism, then, emphasize vassalage, fiefs, service in arms owed the lord, and private administration of justice.

Few debates in English history have been as heated or as long-running as that over the introduction of this kind of feudalism into England. Historians once accepted Anglo-Saxon England as a "prefeudal" society. Military obligation arose, it was believed, not from a contract centered on land tenure but from the almost primordial Germanic duty of free men to defend their country in the *fyrð*, the free nation in arms. Because military obligation in Anglo-Saxon England was pretenurial feudalism was introduced during the Conquest by the Normans, whose military organization was based on tenurial

relationships.

Such a view had its origins in the Victorian idea of Anglo-Saxon England as a peasant commonwealth with a constitutional kingship. This view of the kingdom and of its military organization does not hold up well today. The Anglo-Saxon military organization included many tenurial and contractual characteristics now identified as “feudal.” The origins of Anglo-Saxon military obligation were not based on tenurial contracts, however, but on lordship; a warrior took an oath to be his lord’s man. The king could—and usually did—reward his warriors with a gift of land, but this land, Bede’s “loanland,” was held at the king’s pleasure and did not automatically pass to the warrior’s heir.

Bookland tenure and the Viking invasions changed the conditions under which the king granted land. Bookland, introduced by churchmen in the 7th century, was given by royal charter in perpetuity. Loanland could be given to a warrior for his life and then to another after the first’s death. Bookland did not have that “reusable” quality, so it became necessary to create obligations associated with bookland that were as permanent and hereditary as the tenure itself. The Mercian kings imposed bridge work, fortress work, and *fyrð* attendance on the possession of bookland.

The Viking invasions of the 9th and 10th centuries caused the West Saxon kings to redefine these terms, so that “fortress work” included the maintenance and defense of a system of boroughs and “*fyrð* attendance” was participation in a standing army. By the reign of Edward the Confessor (1042–66) the amount of service owed by one who held bookland was directly related to the value of his bookland in hidage (a tax paid on each hide of land, originally in service but later in money). Concurrent with the development of this system, however, was the continuation of obligation through personal oaths and ties between the magnates, who held bookland from the king, and the lesser warriors, who served them.

The military organization of pre-Conquest Normandy was based less on tenurial relationships than was once thought. The Norman Conquest did dramatically change the tenurial—and thus the feudal—relationship between king and subject in England. The very process of conquest provided both the opportunity and the need for sharply defined military relationships among the conquering Normans. William had won for himself an entire kingdom, and he could organize it in any way he saw fit, but he needed to defend it immediately against threats from without and within.

William distributed the lands of the kingdom to the new Norman nobility in return for what became fixed military services defined in written surveys. By the end of his reign the nobility was organized in a strict feudal hierarchy. All land was held of the king, either directly or by subinfeudation (vassals bestowing fiefs upon their own vassals) from one of the great magnates who

held vast territories of the king. All English nobles thus owed the king military service and were ultimately subject to decisions made in feudal courts.

These conditions developed over the course of William's reign and may have become exactly defined only by the reign of Henry I, but they would be the theoretical basis for the exercise of royal power throughout the medieval period. Henry II was able to introduce and enforce his royal system of justice by insisting on his rights as feudal overlord. Feudal dues became an important source of royal wealth. The knight's fee, a fief from which the service of a single knight was due, became the basic unit of feudal organization. The holder of that fief was obliged to send one knight to serve the king or to send scutage, an amount of money that would enable the king to hire a mercenary knight. Yearly knight service could be commuted by a yearly payment of scutage. Feudal surveys, such as the *Cartae baronum*, doubled as tax surveys, and through feudal dues the English crown became wealthy.

The feudal relationship between the king and his nobles limited both parties. When a king overstepped his limitations, his vassals were no longer obligated to him. Such was the case with John, who manipulated his position as feudal overlord so excessively and with such greed that his barons rebelled and forced him to reaffirm limitations on royal power by accepting Magna Carta. The conflicts resulting in Magna Carta were symptomatic of the growing complexity of society. The invention of "private" property, expensive overseas wars, and an increasingly unstable political situation all served to change the way the feudal relationship worked. The best-known and most destructive change was the advent of bastard feudalism, the reliance upon paid retainers rather than upon tenure and the service based in landholding.

Feuds and Wergeld

Traditional legal history saw bloodfeud as an “interminable antiphony of violence.” Modern scholars have learned from anthropologists that the mechanisms of feud not only contribute to social peace but provide the only realistic chance of peace in a society whose government lacks the means or will to enforce it.

The basic mechanisms are two: death or injury can be compensated by mutually acceptable payments in cash or kind; injuries borne by individuals may be avenged by any one of their recognized associates or any recognized associate of the individual responsible. The prospect of revenge is a disincentive for would-be offenders and an incentive for their associates and those of their victim to seek peace through compensation. The same cast of mind applies to theft; revenge is taken at once on thieves caught *in flagrante*, while theft detected by formal process is amended by restoring the stolen goods or their value, perhaps multiplied.

The Anglo-Saxon bloodfeud confronts historians in three main areas. First, early law codes record the *wergeld* (“man money”), the blood price of free men or different classes of aristocrat. These were 100 and 300 shillings in the code of Æthelberht of Kent (before 616), and 200, 600, and 1,200 shillings in Ine’s Wessex code (ca. 690). The codes of Æthelberht and Alfred also give lists of a wide variety of bodily injuries, with the sum due for each. The point of these, as of wergelds, was as alternatives to application of the “eye for an eye” principle. Vengeance is taken by a victim’s, or against an offender’s kindred (i.e., a more or less “extended” family of collaterals). These are also payees or payers of compensation, though Ine likewise specifies sums due to lords. It is envisaged that pursuit of revenge or compensation is exclusively the business of victim or associates. In the realm of theft the king is more involved, to the extent of forbidding revenge for those caught red-handed, while convicted thieves must not only make restitution to owners but pay a fine to the king.

A second illustrative area is “heroic” literature, where vendetta is prominent,

both actually and figuratively (as when Beowulf's fight with Grendel and his mother is seen as a feud). An important feature of literary feuds is their focus on divided loyalties; between lord and kin, or women torn between husband and father. Presumably these crises attract poetic attention because they are atypical. Nevertheless, conflicts with this sort of mixed feeling are exactly those spotlighted by anthropologists concerned with the paradox of peace in the bloodfeud.

The third category of evidence is (or ought to be) tales of historical as opposed to literary feuds. One of these is the story of Cynewulf and Cyneheard in the Anglo-Saxon Chronicle for 757 (with classic kin-lord dilemma). After the year 900 or so such tales are hard to find. Almost the only example is a Northumbrian feud of the 11th century, recently reinterpreted as a struggle for political power in the north. This ties up with the important point that Edmund's code (ca. 945) took major steps to disrupt the feud mechanism, notably by limiting the liabilities of kin. In late Anglo-Saxon laws *hot* ("compensation") is usually owed to God or king, and wergeld is paid not as blood money by offender to offended kin but as the price of life by criminals to an outraged crown. "Vengeance is mine," said 10th-century kings.

Finnsburh

The "Finnsburh Episode" comprises *Beowulf* 1063–1160a, and the "Finnsburh Fragment" survives as a 48-line poem edited in Hickes's *Thesaurus* 1:192–93. Hickes says he found the fragment, since lost, on a single leaf in a "Semi-Saxon" homily collection in Lambeth Palace Library. Only two Lambeth manuscripts fit his description: MS 489 of the 11th century and MS 487 of the 13th century. Neither codex contains the "fragment," probably a loose leaf or part of the binding.

The two texts tell different parts of the same story, something like this: With 60 retainers the Danish prince Hnæf visits Finnsburh, the fortress of his sister Hildeburh, queen of the Frisian king Finn. For reasons not stated the Frisians attack the Danes in a hall at dawn. The "Fragment" begins when a Danish watchman reports a light to Hnæf, who correctly identifies it as the flashing of Frisian armor. He awakens his troops, and the Danes rush to arm themselves and defend the doors at each end of the hall. Outside a Frisian named Garulf urges his colleague Guthere not to risk his life against the Danes, but Guthere shouts a challenge to the defenders. From inside the Dane Sigferth taunts the two Frisians outside. The battle begins, and ironically Garulf falls first. The fight continues with Frisian casualties only. Here the "Fragment" ends.

The "Episode" begins with Queen Hildeburh awakening to a battle in progress, which rages for five days before any Danes die. The Frisians kill Hnæf and an unstated number of Danes. Finn has insufficient forces to overcome the Danes, who cannot escape from the hall. The Danes offer terms to the Frisians. Finn and the new Danish commander, Hengest, swear an oath, and either pledge money is exchanged or Hnæf's wergeld is paid, or both. Hildeburh presides over the cremation of the slain, including her son and her brother Hnæf. The Frisians return to their homes. Hengest considers sailing back to Denmark but chooses to remain at Finnsburh with his retainers for a

tense winter. Spring tames the winter seas, and Hengest yearns to leave. But first he intends to avenge Hnæf. In a Danish council Hengest accepts a sword from Hunlafing, whose uncles Guthlaf and Oslaf encourage the Danes by reciting all their woes since the original voyage to Frisia. The Danes attack the Frisians, kill Finn, loot Finnsburh, and return Hildeburh to Denmark.

The events of the story happen in the late 4th or early 5th centuries, and Hengest may be the Hengist who invaded Britain ca. 429–49 (Bede, *Ecclesiastical History* 1.15). Both texts appear in traditional late West Saxon language, but date and location remain uncertain.

Scholars generally regard the “Fragment” as a “heroic lay,” a short poem characterized by fast narration, tight description, and terse dialogue, such as *Waldere*. The *Beowulf*-poet calls the “Episode” a *gidd* (1065b, 1160a) and a *leod* (1159b), both meaning “song.” Both texts have epic characteristics, for example, high-ranking warriors struggling heroically over tribal or national fortunes in elevated diction and aristocratic imagery. But the term “epic” invites misleading comparisons with classical epic. Both texts resemble a page or two detached from a larger poem rather than a freestanding lay.

The two texts differ stylistically, although both feature fast action. The “Fragment” brims with dramatic speeches and closely observed, stark detail. The *Beowulf*-poet tells the “Episode” densely and allusively, full of thought and emotion, brooding on revenge and inescapable violence.

Floris and Blancheflour

An anonymous narrative poem composed in the east Midlands ca. 1250–1300, apparently in octosyllabic couplets. It may be the earliest extant English romance, if this place does not fall to *King Horn*. *Floris* survives in four manuscripts: BL Cotton Vitellius D.3, from before 1300, but largely burned in 1731; CUL Gg. 4.27.2, ca. 1300; the Auchinleck Manuscript (Edinburgh, National Library of Scotland Advocates 19.2.1), ca. 1330–40; and Trentham (BL Egerton 2862), ca. 1400. The beginning of the poem has been lost, but its general content can be deduced from the French work on which the English is based; the extant text of the rest runs to 1,311 lines in Taylor’s edition.

Two versions of the story are represented in extant French texts; these have been distinguished as the “aristocratic” (and earlier) version and the “popular.” In company with versions in various Germanic languages the English poem belongs to the “aristocratic” tradition. It opens when Floris and Blancheflour are small children, but it must once have explained that Blancheflour’s mother is a Christian prisoner of the pagan king of Spain and that she and the queen have given birth to their children on the same day. Floris and Blancheflour share their schooling, and by the time they are twelve they have come to love each other so intensely that the king decides to separate them.

Blancheflour is sold to Babylonian merchants, and Floris is told she has died; but when they see how he pines for her, Floris’s parents allow him to go after her. He traces her to the Emir’s “tower of maidens” in Babylon, where she is to become the Emir’s next wife. On the advice of a friend he bribes the porter to smuggle him into the tower in a basket of flowers. He and Blancheflour are reunited, but two days later they are discovered in bed by the Emir’s chamberlain and sentenced to death. As each lover tries to save the other,

however, the Emir is so impressed by their mutual devotion that he spares them, knights Floris, and allows them to marry. He himself marries Blancheflour's confidante, Clarice, and is apparently converted. When Floris's father dies, the couple return to Spain, where Floris and, implicitly, his kingdom become Christian.

The story may have had a Byzantine origin. The love element bears some resemblance to that of French idyllic romance, thought to derive ultimately from certain Greek works; and the tricks by which the hero achieves his goal recall Greek New Comedy. Both these aspects of the story imply a degree of amorality at the individual level, set paradoxically against a concern with religious propriety at the national level.

The English poem is only one-third the length of the French text. The emphasis is less on the descriptive and more on the dramatic, and less interest is shown in love and religion than in wit and ingenuity.

Food and the Food Trades

Accounts of wealthy medieval households show the consumption of all sorts of exotic fare. Some spices traveled halfway across the world before being purchased in London or at one of the greater fairs, and many of the delicate meats consumed at great banquets were expensive regional specialties. But from the broad perspective of England's food supplies these luxuries were side issues, even for large households.

The food trades chiefly involved cereals (for bread, gruel, and ale), cheese, fish, eggs, poultry, and meat. Fruit, vegetables, and milk were not regularly traded but made a useful contribution to the diet of families who could produce their own. In all parts of England there was some food from the wild, but such resources could not be relied on in densely settled areas.

Regional patterns of cereal cropping had implications for eating habits. In most villages bread had to be made from what was grown and traded nearby. The best indicators of local diet are wages and mill rents paid in grain, recorded in manorial accounts. Wheat was the preferred bread grain, and always the most expensive, but much bread was made from mixtures of wheat and rye or wheat and barley. Barley was a staple in Norfolk, England's most densely populated shire. Sometimes the cheapest bread flour contained peasmeal and beanmeal. Oats, unsuitable for bread, were used for gruel and in brewing. Though chiefly used as animal feed, they were important for the diet of the northwest and some upland areas.

During the period for which we have documentary evidence dietary patterns and the composition of the food trades varied with changes in real income. Between 1200 and the Black Death (1348–49) the majority of the population was overwhelmingly dependent on cereals. Protein deficiency may have been widespread. After the Black Death, as standards of living rose, the consumption of wheaten bread and barley ale grew at the expense of inferior cereals; the average consumption of meat rose dramatically.

Even at the peak of urban growth, around 1300, probably over half of all English households grew most of their own food and depended on the market only for small quantities of salt, meat, and cheese. Throughout the period, too, much trade between neighbors bypassed formal markets, and this was mostly within the law. But population growth and increasing economic specialization encouraged the proliferation of weekly markets. One of the reasons for this was the concentration of landless consumers in small communities.

Domesday Books list of 153 boroughs and markets is an imperfect guide to formal marketing in the 11th century; different groups of Domesday commissioners performed their task differently, and the concept of a market was still imprecise. There must already have been more marketlike institutions, particularly in the eastern counties. After 1086 the number of formal markets increased to the point where by 1300 few households were more than a few

miles from one. The highest densities were in East Anglia. During the 14th century severe losses of population contributed to the contraction or discontinuation of many smaller markets.

Village markets and small towns could be supplied with most of their needs from within a ten-mile radius. But where communications by water were available trade over longer distances was common, and from at least the mid-13th century the largest towns depended on water-borne supplies from 100 miles away or more. Londoners bought grain from the Thames Valley and fertile areas of the east coast. Bristol's supplies of grain came by river from far up the Severn. The fatstock (livestock) trade of large towns covered considerable distances overland, and fish were brought from far-off fishing grounds.

Many towns had markets for grain and fish on the waterfront, where wholesalers could buy in bulk and where townsmen were given special provision for supplying their own households. Such, for example, were Queenhithe and Billingsgate in London. Bristol had similar quays on the Severn, York on the Ouse, and Norwich on the Wensum. The largest towns had a separate wholesale fatstock market, like London's Smithfield. These wholesale markets supplied the central urban grain, fish, and meat markets, which handled only retail trade. Most town markets were held more than once a week.

From the late 12th century the importance of the food trades for urban welfare resulted in the multiplication of regulations, some of dubious benefit to the communities they were supposed to protect. The Assize of Weights and Measures (1194) and Magna Carta regulated measures in the grain trade. By 1202 assizes of bread and ale were enforced to tie the price of ale and the size of the farthing loaf to the market price of grain. These regulations were enforced by local authorities on behalf of the crown, though in time they came to be valued more as a source of income from fines than for their original purpose. In the 13th century local by-laws governing the food trades multiplied, chiefly to protect burgesses at the expense of nonburgesses. In the 14th century the food trades were further hampered by poorly drafted laws against the monopolizing of produce by "forestallers," who bought in advance to drive up prices, and against uncontrolled levels of profit in selling.

The food trades have a particular sociological interest because of the prominence of women in some branches. Butchery, milling, and baking were male occupations, but brewing and the retailing of ale were predominantly women's work. Langland's Rose the regrator ("retail trader") and Skelton's Elynour Rummyng are informative portraits of medieval alewives, despite their pejorative presentation. Women were also prominent in the retailing of fish, poultry, and eggs, as is clear from the lists of those reported for

forestalling in urban court records.

Forests, Royal

Areas established by the king with special laws to protect the "beasts of the forest" and their habitat for the king's hunting. The beasts were the red, fallow, and roe deer and the wild boar (until the roe was removed from the list in

1339). The Normans brought the notion of the royal forest to England and established the New Forest as an early example of the concept.

Under Henry II the royal forests reached their greatest extent, and they continued to include an estimated one-fourth of the realm in the 13th century. Efforts by the barons to restrict them resulted in specific chapters in Magna Carta in 1215, a separate Forest Charter in 1217, and later confirmations of both charters. However, massive disafforestation occurred only in 1327. Enforcement of forest law then deteriorated, and a mere shell of the medieval royal forest existed when described by John Manwood in one of the first books on the subject, *A Treatise and Discourse of the Laws of the Forest*(1598).

Hunting was prohibited in a royal forest; so also was the cutting of trees, bringing land into cultivation, pasturing farm animals, and other activities related to the use of forest products. Income from fines for violations and user fees were a significant factor in royal income by the later 12th century. For barons who had manors within the royal forest and the villagers who lived there the restrictions meant a heavy burden. Enforcement was carried out by means of a hierarchy of forest courts and officials. When the Anglo-Saxon Chronicle stated that William the Conqueror “loved the stags as if he were their father,” it expressed the hatred of a forest law that valued a deer more than the life of a man, and the harsh reality of that law provided the background for a fictional Robin Hood transmitted to future generations through popular ballads.

Formula

A type of poetic phrase first used by oral poets as one of several aids to rapid composition before an audience. For example, if an OE oral poet wished to praise a leader, he need only call to mind a formula like *pat was god cyning!* ("That was a good king!") or *sinces brytta* ("giver of treasure"). Such phrases were available to the poet for a broad spectrum of ideas, sometimes repeated verbatim, sometimes not. Formulas could be varied to suit their prosodic, thematic, or narrative contexts, as well as the artistic impulse of the poet.

Specifically a formula is a member of a set of verses in which one word, usually stressed, is constant and at least one stressed word may be varied, usually synonymously, to suit the alliterative or narrative context. For example, the following phrases are found a total of thirteen times in five different poems: *sinces brytta* ("giver of treasure"), *goldes bryttan* ("giver of gold"), and *beaga bryttan* ("giver of rings"). All three verses are the same formula: all express the same general concept, "giver of wealth," and all serve the same purpose, to denote an ideal king or chieftain. In this instance the poets probably recalled the pattern [*wealth*] *brytta* (or *bryttan*, when the accusative case was required) and then varied the synonyms for "wealth" to accord with their alliterative needs. That is, if an "s" alliterator governed the line, the poet chose *sinces*; if he needed a "b" alliterator, he chose *beaga*; and so forth.

Formulas usually share the same poetic meter and are usually one verse, or half-line, in length (though not all half-lines of OE poetry are formulas). Further they are often part of larger formulaic systems that provided patterns for the creation of new metrical phrases: *X brytta*, for example, is a systemic pattern that lies behind not only [*wealth*] *brytta*, but also *lifes brytta* ("giver of life"), a formula denoting God; and *morpres*, *hearmes*, or *synna brytta* ("giver of crimes," "of harm," or "of sins"), a formula denoting the Devil. The verses [*wealth*] *brytta*, [*life*] *brytta*, and [*evil*] *brytta* represent three different formulas, all members of the system *X brytta*. Although formulas derive originally from oral poetry, they were used extensively by poets writing in our earliest literary tradition.

Fortescue, Sir John (ca. 1390–1479)

The most prolific and widely quoted man of law of 15th-century England, Fortescue supported Lancastrian interests so passionately that he earned a traitor’s attainder and exile into France for ten years after the Yorkist victory at Towton (1461). The exile sharpened his perspective for comparative Anglo-French law and, after his last Lancastrian battle, at Tewkesbury (1471), for a more mellowed view toward Edward IV’s dynastic claims. A royal councillor for at least four years in the 1470s in the Star Chamber, Sir John died, according to Devonshire legend, at age 90.

Fortescue began legal training at Lincoln’s Inn before 1420 and served as member of eight parliaments from Devon, 1421–36. Active as a justice of peace since 1418 and on dozens of commissions of *oyer et terminer*, he obtained Henry VI’s appointment as king’s serjeant in 1441 and as chief justice of King’s Bench in 1442. Before 1461 he was the most important working judge in England, scattering his name across miles of parchment plea rolls, patent rolls, and diverse other public and private records, including the Paston Letters.

Eleven essays survive in his name, another five have been attributed to him, and five more are known but lost. Of these 21, at least eleven are pamphlets promoting the Lancastrian succession; seven others are minor didactic essays. The final three are major works of political jurisprudence and goldmines for readers and writers of late-medieval constitutional law. *De natura legis naturae* (*On the Nature of the Law of Nature*) distinguishes law from justice, divine from natural, and then examines at length why women cannot rule. Fortescue partially recanted this strong antifeminist tract, to make personal peace with the Yorkists, but John Knox picked up the argument a century later against the Tudor queens, in his tract *Against the Monstrous Regiment of Women* (1558).

De laudibus legum Anglie (*In Praise of the Laws of England*) compares absolute and limited monarchy, at the expense of France, extolling the English balance of natural, customary, and statute laws as a superior system for civil and criminal justice. Like his distinguished fellow judge Sir Thomas Littleton (1415–1481) Fortescue emphasizes legal theory over formalism. This treatise ends with the first detailed description of English legal education and judicial practice.

His final tract, *De dominio regale et politico* (*On Regal and Political Lordship*) continues Fortescue's thoughts on the theme of absolute versus limited monarchy, borrowed from Thomas Aquinas. Fortescue's writings may lack originality of ideas, but they offer vital information for pre-Reformation law and government, as well as sound models for the lawyer's style of political advocacy.

Frankpledge

The frankpledge system, a form of corporate responsibility for bringing offenders to trial, was a key element in local law enforcement in southern, midland, and eastern England in the 12th and 13th centuries. Its origins lay in two late Saxon institutions, the tithing (a unit for the pursuit of criminals) and suretyship (a pledge of appearance in court). By the early 12th century the concepts had fused, possibly as a result of peacekeeping reforms by William I. The tithing not only had a police function but was also the "frankpledge," or

collective security for its members.

South of the Thames the number in a tithing only approximated to ten; tithing and township were commonly identical. All males over twelve, except clergy, vagrants, the disabled, and families and household retainers of lords, were required to be in a tithing. Wealthier freeholders were exempt in practice; it was mostly unfree peasants who were in frankpledge by the 13th century. If a man accused of crime did not appear in court, his tithing would be amerced (fined) for his absence. If he had no tithing, and should have had one, the whole township would be amerced.

Sheriffs held a “view of frankpledge” to check the composition of tithings and take customary payments at special twice-yearly sessions of the hundred courts (the “sheriff’s tourn”). After the Assize of Clarendon in 1166 these became important occasions for searching out criminals, and the chief pledges (the heads of each tithing) were among those required to present (formally report) offenders. This was also the practice when the right to view of frankpledge was acquired by a feudal lord or a borough. Although the system decayed in the late 13th and 14th centuries, as new peacekeeping measures were devised and sheriffs ceased to check tithing lists, view of frankpledge remained a valuable franchise and a useful means to maintain local discipline. Accordingly it continued as a feature of the “court leet,” or local court, held in many manors through the 15th century and beyond.

Franks Casket

This whalebone casket (London, British Museum MLA 1867, 1–20.1; approx. 9

inches long by 5 inches high by 7.5 inches wide) was probably made in 8th-century Northumbria. The front, back, left side, and central panel of the lid were discovered in the mid-19th century in Auzon near Brioude (Haute Loire), France, and passed into the collection of Sir Augustus Franks, who gave them to the British Museum in 1867. The right side of the casket was found in the same house in Auzon and passed through the Carrand Collection in Lyon to the Bargello Museum in Florence. In 1890 Sven Söderberg of Copenhagen noted the relationship of the Bargello panel to those in the British Museum.

Fig. 63. Franks Casket (London, British Museum MLA 1867, 1–20.1). Courtesy of the Trustees of the British Museum, London.

The casket (fig. 63) is joined by tenons in the panels extending into mortises in corner uprights, secured by wooden pegs. The lid was originally seated into a rebate around the top of the box body and lifted by a central knob or handle once attached to the center of the surviving lid fragment.

The front panel shows two scenes, separated by a short strip of guilloche (interlace design). At the right is an Adoration of the Magi, labeled “mægi” in runes. At the left is the Revenge of Weland the Smith. The runic inscription around the perimeter of both scenes reads, “Whalebone. The flood cast the fish up on the life mountain. The mighty one was sad when he was cast up.”

The surviving lid fragment shows an enclosure defended against a warband

by an archer, labeled “Ægili.” A woman seated behind the archer extends an arrow toward him. The archer has been tentatively linked with Weland’s brother Egil, but the scene does not correspond to any event in the extant literary sources.

The left side panel shows the suckling and discovery of Romulus and Remus, with the unusual addition of a second wolf, and with four hunters kneeling, suggesting a reference to twin cults (Becker). The runic inscription reads, “Romulus and Remus, two brothers. The she-wolf raised them in the area of Rome.”

The back of the casket shows the conquest of Jerusalem by Titus, with the inscription, “Here fight Titus and the Jews. Here flee the inhabitants of Jerusalem,” the first line in runes, the second in Latin letters. The scene is depicted in two registers around a central building. In the upper register, Roman soldiers enter at left, while civilians flee at right. Below at left a scene of judgment, labeled “dom,” is balanced by a group of captives, labeled “gisl,” “a hostage,” at right.

The interpretation of the scene on the Bargello panel is controversial. At left a warrior confronts a monster. At center a horse confronts a chalice- and rod-bearing woman above a tomb(?). At right two cloaked flanking figures seize a third between them. The inscription, using variant runes, reads, “Herhøes sits on the hill of injury. She works misery, as Erta commanded her. They created grief, sorrow, and anguish of heart.”

The fusion of Christian and pagan motifs demonstrates the cultural diversity and richness of the Northumbrian renaissance.

Friars, Mendicant

Friars are members of religious orders that combine a noncloistered religious life with economic dependency on alms originally gained by begging (mendicancy). The Friars Preachers, or Dominicans, were founded by Dominic of Caleruega (ca. 1172–1221), and the Friars Minor, or Franciscans, were founded by Francis of Assisi (1181/82–1226). They aimed to reintroduce the apostolic life of the New Testament into the growing towns of the early 13th century. The friars' involvement with the people of these urban communities, while more immediate than that of monks (who were ordinarily expected to remain inside their monasteries), became something of an economic threat to the secular clergy (clergy not in religious orders, who served most parish churches). With the mendicant ideals of evangelical poverty, charitable love, and preaching while wandering across the land the friars deliberately made themselves dependent on alms freely given for their sustenance, as the first apostles were when sent out by Christ in pairs (Matt. 10:7–10). The Dominicans were ordained priests, dedicated to the salvation of souls through preaching and teaching. On the other hand Francis and his first companions were laymen whose message was the imitation of Christ himself, as revealed in the practice of poverty, mendicancy, and mission. By the end of the 13th century the Franciscans were also mostly ordained and had begun to take on a priestly role.

In 1217 Dominicans and Franciscans alike dispersed throughout Christendom, and within five years the first missions reached England. On 5 August 1221 thirteen Dominicans, or Black Friars, led by Gilbert de Presnay and including several Englishmen, landed at Dover and went directly to Oxford, there to undertake a thorough preparation for the later stages of their mission. Dominic himself and the second general chapter of the order confirmed the instruction to restrict the initial settlement to Oxford.

Contemporary evidence for the Franciscan mission comes from the chronicle of Thomas of Eccleston, ca. 1258–59. Nine Franciscans, or Grey Friars, arrived in England on 10 September 1224, led by Agnellus of Pisa and assisted by three Englishmen, Richard of Ingworth, Richard of Devon, and William of Esseby. In contrast to the Dominicans the Franciscans separated

immediately and made three important urban settlements within six weeks at Canterbury, London, and Oxford, followed rapidly by a fourth in Northampton. Between 1225 and 1230 a further twelve foundations were made. Numbers so increased in individual houses that 40 Franciscan friars were counted in Oxford by 1233, 80 in London by 1243, and 60 in Canterbury by 1289. By 1300 some 59 Franciscan foundations out of a final total of 63 were in existence.

The earliest Franciscan settlements were simple, consisting of a small tenement with no open space for extra building. At first the corporate poverty enjoined by Francis was rigidly observed, but later a third party or “spiritual friend,” often an urban community, such as Cambridge or Northampton, was legally able to hold property for use without possession by the Franciscans. Although vowed to individual poverty, the Dominicans were never bound to corporate poverty. They could own their priories and hold landed property on which their houses stood. They were also able to accept revenues from ecclesiastical sources, thus ensuring a considerable element of stability as they expanded. Both orders attracted gifts of property, legacies, and benefactions. Henry III provided gifts of timber from his forests, while his successors down to Richard II proved equally generous as patrons.

Such rapid popularity revealed the need for controlled organization. Both orders established provinces in England. The English Dominican province, which became the largest in the order, had to be divided into four visitations for disciplinary purposes: London, York, Oxford, and Cambridge. Each new foundation had to be approved by the general chapter on the recommendation of the provincial chapter, while a constitutional requirement laid down that each priory should have its own theologically trained priest. By 1250 there were already 24 foundations; by 1300 some 48 of the final total of 57 English Dominican houses were in existence. The Dominicans, however, never quite managed to outstrip the Franciscans numerically. Thomas of Eccleston estimated that by 1255 there were 1,242 Franciscans in England, averaging about 25 per house. The Franciscan general chapter divided the English province into custodies, each with its own *custos*, centered on London, Oxford, Bristol, Cambridge, Worcester, York, Newcastle, and Salisbury. It is interesting that the two orders found no problem in working together (fig. 64).

Dominicans and Franciscans alike made academic training a precondition for the office of preaching to the laity. Both were noted for remarkable intellectual achievement. With the exodus of masters from Paris in 1229 the universities of Oxford and Cambridge grew in importance, built up by the mendicants as centers of excellence and helped by the orders efficient network of schools and libraries. The significant difference between the two orders was revealed in their attitude to the apostolic model of preaching and teaching. The

Dominicans, while stressing individual poverty, concentrated on the need to preach what they had learned in their studies. Every Dominican priory was a house of studies with a resident doctor of theology. The Franciscans, traveling in pairs, stressed the moral conversion of their audience by the example of apostolic poverty and simplicity. Their itinerant preaching, supported as it was by their

Fig. 64. Friaries founded before 1240. After L.A. S. Butler (1984), in J. Schofield and R. Leech, Urban Archaeology in Britain (1987). Reprinted with permission of the Council for British Archaeology.

pocket-sized books and material aids, received strong support and

encouragement from John Pecham (ca. 1220–1292), the first Franciscan to become archbishop of Canterbury (1279–1292). He reinforced this support by legislation in the English synods of the late 13th century, particularly with respect to the hearing of confessions in Lent.

Both orders attracted the most talented scholars of their day. The Englishman and Paris doctor Haymo of Faversham, appointed as provincial minister of the Franciscans in 1239 to unite mendicant zeal and austerity with the selflessness and intellectual discipline of the universities, was elevated as minister general of the whole order within a year. Robert Grosseteste (1175–1253), patron of both orders of friars and the first lecturer (1229–30) to the Franciscans of Oxford, was not himself a mendicant but was immensely important in fostering Franciscan learning. The Franciscans' Oxford house of studies became a center of excellence in theology for the province, and its great library was build up by Adam March and then by Grosseteste. The reputation of such men as Alexander of Hales, Roger Bacon, Duns Scotus, and William of Ockham attracted Franciscans from all parts of Christendom.

The Dominicans' academic reputation was enhanced by the reception into the order of the Paris master John of St. Giles in 1230 and by the work of the regent master Robert Bacon, his pupil Richard Fishacre, and Simon de Bovill, chancellor of Oxford. Robert Kilwardby, noted scholar, former provincial minister (1260), and the first Dominican archbishop of Canterbury (1272–78), helped the London Dominicans to procure a new site at Baynard's Castle near the Tower.

The mendicants' use of the liturgy also revealed differences between them. The Franciscans in particular, because of their itinerant preaching and consequent instability, needed to say the offices wherever they happened to be. They were responsible for the introduction of the portable breviary, a single collection in one volume of all the necessary elements for the recitation of the offices previously distributed throughout several anthologies. The Dominicans, on the other hand, retained the pattern of normal liturgical prayer but from the beginning allowed dispensations for the purposes of study and preaching.

Mendicant architecture was to develop its own distinctive style to accommodate the growing congregations attracted to the friars. In their churches choirstalls were often placed in the chancel to leave the nave entirely free. Slender pillars, windows of great proportions, and an ample floor area created the illusion of unlimited space and light. Unique to English Dominican churches was the oblong "walking place" between the supporting walls of tower and belfry, which served as an entrance to the church from the great cloister and the street. Franciscan buildings often surpassed in size those of the Dominicans; the vast new Greyfriars' Church in London measured 300 feet by 83 feet.

In the later Middle Ages the progress of both orders followed the path laid down by their predecessors. Despite virulent polemics and satire against the friars by some monks, secular clergy, and vernacular authors, recruitment remained buoyant, and some 1,500 friars continued to receive gifts and benefactions in money and kind. The reformed Franciscans, known as Observants, so popular on the Continent, aroused little interest in England. By 1507 only six Observant houses had been founded, and these were the first to suffer during the Protestant Reformation, in the visitation of 1534. In 1538 Richard Ingworth, bishop of Dover and previously provincial prior of the Dominicans, was instructed to visit all friaries, as part of Henry VIII's and Thomas Cromwell's policy of harassment. Within a year the mendicant orders had almost entirely withdrawn from England.

Friars' Miscellanies

A designation that has been applied to a number of manuscripts (up to eight) containing much of the extant English verse from the later 12th and the 13th centuries. They have been grouped together because they contain lyrics in English and labeled "friars' miscellanies" because of a belief that early ME lyrics were composed and circulated principally by friars.

These manuscripts are best seen as a sample of the ways in which English literary traditions were preserved and developed for a variety of functions and audiences between the mid-13th and mid-14th centuries. The compilers made significant use of longer poems from around the late 12th century, such as the *Proverbs of Alfred*, *Poema morale*, La3amons *Brut*, and *The Owl and the Nightingale*, and there are continuities with pre-Conquest literature. New developments associated with the Fourth Lateran Council (1215) and the popular preaching of the friars are certainly present. But English lyrics are not the major constituent of any of these compilations, and they all combine English verse with substantial proportions of French or Latin or both. For example, Cambridge, Trinity College B. 14.39 is predominantly homiletic, Bodl. Digby 2 scholarly, BL Harley 913 Latin and clerical; BL Egerton 613 is designed at least partly for devout women. The remainder—BL Cotton Caligula A.ix, Bodl. Digby 86, Oxford, Jesus College 29, and Harley 2253—contain a greater element of the vernacular, secular, and literary.

This grouping has been encouraged by the manuscripts' sharing of some items and their closeness in date and provenance—they range from the 1250s to the 1330s, and are all from the southwest Midlands, except Digby 2 (probably Oxford) and Harley 913 (Ireland). This does indeed suggest a particular local strength of English as a written language *vis-à-vis* French.

However, only for those two outsiders is there strong evidence of origins among the friars. (For "friars" one can generally read "Franciscans": as Frankis has shown, the evidence linking such miscellanies with the Dominicans or other mendicant orders is weak.) The occurrence of texts with mendicant associations, and an element of vernacular preaching, some of it popular in

tone, is hardly decisive; recent scholarship has emphasized the possibilities of compilation by Augustinian or Premonstratensian canons and of lay readership and ownership. Securely attributed comparable manuscripts are few, and as a result our knowledge of the kinds of collections that mendicant and other institutions might have made and used is incomplete. Nevertheless, Harley 2253 was recognized even by those who first grouped it with these manuscripts as not originating with the friars.

These manuscripts do show sporadic signs of homiletic use and homiletic sources. They were also drawn upon in 14th-century preaching handbooks and exemplum collections (including some works certainly by friars), such as Bromyard's *Summa praedicatorum*, the *Fasciculus morum*, and John Grimestone's *Commonplace Book*. However, the later collections contrast strikingly with the miscellanies in their consistent homiletic character, Latin framework, systematic organization, and restriction of English mainly to illustrative verses.

Frithegod (fl. ca. 950)

Poet and scholar, whose authorship of the *Breuilouquium uitae Wilfredi* is the only ascertainable fact in his life. Opinions differ about his nationality; traditionally he has been considered an Anglo-Saxon, but recently the theory has been put forward that he was a Frank. Whether he wrote any works other than the *Breuilouquium* is an open question. The octosyllabic poem “Ciues caelestis patriae,” a *Vita Audoeni*, a work beginning with the words *De peccatrice in euangelio*, and the so-called *cantas-lieder* (charity songs) are all said to have been composed by him, but none can certainly be proven to be his work.

As the only work definitely attributed to Frithegod, the *Breuilouquium* must stand at the center of any investigation about him. Stylistically it is characterized by the use of Greek words, some of them obscure. The appearance of the same stylistic feature in “Ciues caelestis patriae” and the *cantas-lieder* suggests that Frithegod composed these poems as well. Since Anglo-Saxons of the mid-10th century generally did not possess the knowledge of Greek exhibited in the *Breuilouquium*, Frithegod was traditionally thought to have been influenced by the Irish, but the most recent theory declares him to be a foreigner from Francia.

The *Breuilouquium* also provides an indication of the time at which Frithegod flourished. In the epilogue it is dedicated to Archbishop Oda, who died in 958; Canterbury received the relics of St. Wilfrid in 948, so that the poem must have been written between 948 and 958. Frithegod’s connection with Oda in turn allows the following conjectures: Oda had been in France in 936, and it may well have been on this occasion that Oda invited Frithegod to come to England. Oda also acquired some relics of St. Audoenus for Canterbury, which could have given the impulse for the composition of the *Vita sancti Audoeni* (none of the surviving lives of St. Audoenus can with certainty be attributed to Frithegod). Finally no traces of Frithegod can be found in England after Oda’s death, which would suggest that he returned to his native land once he was deprived of a patron in England.

Froissart, Jean (13377–1410?)

French poet and historian. Born at Valenciennes, he became a cleric, initially serving the counts of Hainault. In 1361 he came to England as a clerk to Queen Philippa and stayed until her death in 1369. He returned to Valenciennes, received ecclesiastical appointments, and continued to write for other patrons.

Froissart wrote courtly lyrics, allegorical verse narratives, prose chronicles, and the long verse romance *Méliador*, his major poem. Some of his shorter narratives influenced Chaucer. Froissart was most renowned in England for his massive *Chroniques de France, d'Engleterre, et des pais voisins* (*Chronicles of France, England, and Neighboring Countries*), which are notable for their emphasis on chivalric virtues in descriptions of the wars with France, and their disparagement of the lower classes in descriptions of popular uprisings.

Fuller Brooch

A silver disc brooch inlaid with niello, the unprovenanced Fuller Brooch ([fig. 65](#)) is one of the masterpieces of late-9th-century metalwork. The brooch takes its name from the 20th-century collector Capt. A.W.F. Fuller. Although the original pin mechanism has been lost, the excellent condition of the brooch itself suggests that it has never been buried (Wilson, 1984: 9). The brooch measures about 4.5 inches in diameter and is divided into three primary zones of decoration: a central lozenge or cruciform shape, four lentoid panels, and an openwork outer border.

The iconographic program is made up of personifications of the four senses in the central medallion and symbols of the different realms of the natural world in the roundels of the border. At the center of both the brooch and its program of decoration is the large, iconic figure of Sight holding foliate branches, scepters, or cornucopias and dressed in the pallium (a band worn over the shoulders and down the chest, symbolizing episcopal authority). Surrounding Sight are personifications of Smell, hands behind his back, sniffing a plant (upper right); Touch, clasping his hands together (lower right); Hearing, in a dancing posture, one hand cupped to his ear (lower left); and Taste, his right hand in his mouth (upper left). The border is divided into four equal arcs, each containing roundels with the image of a man, quadruped, bird, and foliate design. Together these images represent both the world in which

human beings live and the means by which they experience that world.

The central image of Sight is very close to, and has often been compared with, the figure of Sight or Wisdom on the Alfred Jewel, also of late-9th-century date (fig. 1: see ALFRED AND MINSTER LOVELL JEWELS). The intellectual nature of the brooch's symbolism, the emphasis on divine creation (in the border), and the gaining of wisdom (through the senses, primarily sight) are in full accord with the educational reforms of the Alfredian era.

G

Gaimar, Geffrei (fl. ca. 1140)

Anglo-Norman chronicler; composed a history of England for Custance Fitz Gilbert around 1140, probably in Hampshire and Lincolnshire.

The extant text, *L'estoire des Engleis*, is only a portion of the complete work as described in Gaimar's epilogue. Written in octosyllabic couplets, it survives in four manuscripts and treats the period between 495 and 1100. Up until the reign of Edgar the text is largely a translation of the Anglo-Saxon Chronicle; thereafter Gaimar uses a variety of sources. The *Estoire* is of particular interest for its interpolated narratives, such as the story of Havelok the Dane, Gaimar's version of which is the earliest known.

Galba Psalter

BL Cotton Galba A.xviii is a small, luxurious Carolingian psalter traditionally, though probably erroneously, associated with King Æthelstan. English additions, made at Winchester in three phases in the early 10th century, include computus tables, a metrical calendar designed for private devotional use and illustrated with zodiac signs and figures of saints, prayers, a litany in Greek, and a series of full-page christological miniatures on inserted leaves.

Only three remain in the book: one (the Nativity) is detached and housed in the Bodleian Library (Rawlinson B.484, fol. 85), and one has been lost.

When complete, the picture cycle marked the threefold psalter division and important points in the prefatory text. It comprised a Nativity at Psalm 1, probably a Crucifixion at Psalm 51, an Ascension at Psalm 101, and two scenes of Christ the Judge set within the prefatory texts. This first surviving unified Christ cycle decorating a psalter was probably inspired by insular emphasis on christological interpretations of the Psalms and by texts equating the Psalter with the whole of salvation history. The placement of the images at the major divisions of the Psalter text adapted insular tradition and in turn influenced succeeding artists.

Fig. 66. Galba Psalter. (BL Cotton Galba A. <viii>), fbl 2v. Christ in Majesty with Prophets and Apostles. Reproduced by permission of the British Library, London.

For the Nativity and Ascension pictures the artists utilized Byzantine iconography, and post-iconoclastic Byzantine art also influenced their figural style. The two complex scenes of Christ the Judge surrounded by heavenly choirs (fig. 66) are deeply rooted in insular art, fusing earlier insular Last Judgment iconography with typologically related Old Testament,

ecclesiological, and sacrificial concepts. The first is the psalter's frontispiece, while the second prefaces a devotional prayer complementing its imagery. Subsequent prayers reflect the litanic quality of the miniature.

The display of the instruments of the Passion in the first and of Christ's wounded side in the second precociously points forward to Romanesque Last Judgment iconography. The two pictures influenced the decoration of several later Winchester manuscripts, such as the Benedictional of Æthelwold (BL Add. 49969; [fig. 26](#): see BENEDICTIONAL OF ÆTHELWOLD), the Grimbold Gospels (BL Add. 34890), and the Tiberius Psalter (BL Cotton Tiberius C.vi; [fig. 139](#): see TIBERIUS PSALTER).

Gascony

The southwestern French province of Gascony did not correspond to a natural geographical region but was an historical creation of the early Middle Ages, comprising a number of counties (principally Armagnac, Bigorre, Comminges, Rezensac, Lomagne, Albret, Marsamme, and Béarn), extending from the Garonne River in the north to the Pyrenees in the south and Languedoc (Toulouse) in the east. It separated from Aquitaine to become an independent duchy in the 9th century, with its capital at Bordeaux. In the mid-11th century the dukes of Aquitaine added it to their great duchy, with their capital at Poitiers.

In 1152 the comital family of Anjou acquired Gascony through the marriage of Henry Plantagenet with Eleanor, heiress of Aquitaine-Gascony, and when Henry ascended the English throne in 1154 the province became part of the vast Angevin Empire. During the reign of John the Capetian kings of France, aided by local nobles restive under English rule, began attacking the Angevin domains with the goal of expelling the English from their kingdom. The English, however, maintained their control of Gascony even when losing almost all the rest of Aquitaine by the mid-13th century. From the later 13th century the dispute was aggravated by the English claim to Gascony as a sovereign state, independent of the French crown, whereas the French kings insisted on recognition of the province held as their fief.

The Hundred Years War inaugurated a new and what proved to be the final phase in the struggle for Gascony, in the process inflicting great suffering on the Gascon population. After notable successes in the war's early phases, when they regained much of the larger duchy of Aquitaine, the English steadily lost ground in the 15th century, and the surrender of Bordeaux in 1453 brought their control of Gascony to an end.

During their more than two centuries of rule the English developed a system of local and centralized administration in Gascony, a system that served them well but imposed a heavy financial burden on the monarchy. One of the strongest links between England and Gascony in the 14th and 15th centuries was the wine trade that sent prodigious quantities of Gascon wine to England through the port of Bordeaux.

Genesis, Old Saxon

Five passages from an Old Saxon poem on Genesis were copied alongside much extraneous material into a manuscript that contains a series of Latin computistical texts and a calendar. The manuscript, Vatican pal. lat. 1447, also contains a brief extract from the Old Saxon *Heliand*, a lengthy poem on the life of Christ. The surviving portions of the Old Saxon *Genesis* describe a speech by Adam to Eve after he has eaten the apple (lines 1–26a); part of the story of Cain and Abel (27–80); the plight of Adam, Eve, Seth, and Enoch after the Fall (81–150); Abrahams plea for Sodom (151–250); and its destruction (251–337). In each case the Old Saxon poem expands the biblical account dramatically, with recourse to other scriptural sources as well as to popular apocryphal and apocalyptic traditions.

The opening section of the poem corresponds perfectly to lines 791–815a of the OE poem *Genesis*, and the discovery of the Old Saxon *Genesis* by Zangemeister in 1894 confirmed the brilliant suggestion of the young Sievers in 1875 that lines 235–851 of the OE *Genesis*, which he designated *Genesis B*, drew on an Old Saxon original. In particular Sievers pointed out that *Genesis B* includes a number of Old Saxon words and employs a looser meter than the rest of the poem, now known as *Genesis A*, that contains it. More recently Raw has indicated that not only has the text of *Genesis B* been drawn wholesale from the Old Saxon *Genesis*, but the illustrations in the Junius manuscript have themselves a similar provenance. Such evidence suggests the extent of our loss: the surviving portions of the Old Saxon *Genesis* represent but a tiny fragment of a substantial and lavishly illustrated original.

Genesis A and B

The first text in the illustrated codex of OE poetry Junius 11, written ca. 1025, perhaps at Canterbury, and preserved in the Bodleian Library, Oxford. Its 2,936 long alliterative lines form a more-or-less continuous paraphrase of the first half of the biblical book of Genesis, with a few omissions and losses. It was long attributed to Cædmon—hence its older title, "The Cædmonian Genesis"—but the actual origins and date of most of this text are unknown. In 1875, on the basis of vocabulary, syntax, and meter, E. Sievers convincingly postulated that lines 235–851 were translated from an Old Saxon (continental Saxon) original. He named the "Saxon" part *Genesis B* and the rest *Genesis A*. His general hypothesis was dramatically proved by the discovery in 1894 of three fragments of the Old Saxon version in a Vatican manuscript. The first of these fragments corresponds almost word-for-word to *Genesis* 791–815a.

Genesis A is a relatively faithful paraphrase, following verse by verse a mixed text of the Latin Bible literally enough that in dozens of places readings from the Old Latin version of the Bible stand out against the Vulgate background. It also adds material that brings the paraphrase into the style and meter of OE poetry and minimally explains the meaning of biblical material.

So, for example, “et appareat arida ... et vocavit Deus aridam terram” (“‘and let the dry land appear’... And God called the dry land Earth”; Gen. 1:9–10) is rendered “geseah pa lifes weard / drige stowe, dugoda hyrde, / wide æteowde pa se wuldorcýning / eorðe nemde” (“life’s Guardian, the protector of men, saw the dry place, the king of glory revealed it afar, named it Earth”; lines 163b–66a). Close as it is to the Latin, this rendering supplies both the alliteration and variation of poetic style and a rationale for “appareat” at a time before there was anybody to perceive the dry land. Numerous elaborations beyond the biblical text, almost always explaining or expanding the literal meaning, depend ultimately on patristic commentary. For example, Adam’s shamefaced remark that he now bears on himself the symbol (“tacen”) of his sin (885–86) goes back to Augustine’s remark that the outer sign of original sin was the “new motion of the flesh” (*City of God* 16.17). Similarly, the poet’s explanation that Noe’s raven, “se feond,” did not return to the ark because it stayed to feed on floating carrion (1446) goes back to the rabbis and was canonized by Augustine (*Quaestiones in Heptateuchum* 33.5).

Repetitions of material are avoided fairly consistently, leading to many omissions; for example, about half the original verses are omitted from the Flood narrative. Overall the poet omits about 150 verses while representing about 350. The intent seems to be to preserve the continuous gist, not narratively interesting moments, for quite prosaic material is retained, such as the details of the genealogies. There are about 300 additions of material that go beyond mere poetic expansions, though few that are obviously legendary or apocryphal. The two most obvious additions illustrate their nature: the lengthy proem in lines 1–111 provides an “hexameral” (i.e., “six days of Creation”) opening that establishes a theme of praise based on the Preface to the Canon of the mass, and describes the creation and fall of angels, the reason for the creation of humankind, and the creation through the Logos, all standard topics in Christian Genesis commentaries; the expansion of Genesis 14:1–16 (1960–2101) is a Germanic battle epic in miniature that has only the haziest motivation in the text.

Though *Genesis A* has often been condemned as dull and unpoetic, it is in fact a learned and carefully crafted poem, marked by a masterly traditional style while showing a taste for figuration, wordplay, and the deliberately complex obscurity of expression sometimes called “hisperic” (see, e.g., 985ff.). It sometimes rises to expressive heights, as in the episodes depicting the doubting of Sara and the sacrifice of Isaac. As a sustained effort to fully represent a biblical text in both its literal and interpretive dimensions there is nothing to compare with it in English until *Cursor Mundi*.

Genesis B depicts the Fall of Angels and the Fall of Man; its interpolation into *Genesis A*, just at the place where the Fall should be, implies that it is

making up for text lost from a previous copy of A. The Saxon original was composed ca. 840–50, probably for the court of Louis the Pious (d. 842) or his son Louis the German. The poem was in England by ca. 900, probably in its complete Saxon form and in an illustrated codex, perhaps as part of an ensemble including the Old Saxon biblical epic, the *Heliand*, a retelling of the Gospel story (see Raw). Old Saxon and West Saxon are closely related dialects and were probably mutually intelligible in the 10th century. The mixture of early and late West Saxon forms in *Genesis B* and the inconsistencies of vocabulary (such as the three different treatments of Old Saxon *thwingan*) and syntax suggest it was transliterated gradually in successive copies rather than systematically translated.

Often called the Anglo-Saxon *Paradise Lost*, *Genesis B* is one of the finest poems in OE, with its straightforward narrative style, striking drama, psychological detail, and theological coherence. It is unlike any other OE poem in the originality of its plot and its intellectual density (see Burchmore). In these features as well as in its vocabulary and its long “Saxon” metrical lines it betrays its Carolingian origins. A free retelling of the two Falls, in the spirit of the apocryphal Adam books, the poem emphasizes good and bad will and obedience. Satan is given speeches that mock him by showing how blind he is to the gifts (grace) he has received and how he futilely struggles against God’s plan. The demon approaches Adam first and only then tempts Eve. Eve is seduced by a promise, which she interprets as “angelic,” of gifts that will give her power and authority over Adam. The weakness of humankind and the grace of God are emphasized by a conclusion that shows not God’s condemnation of Adam and Eve but their ritual repentance and recommitment to obedience. The whole poem, which is studded with explicit comments by the narrator, is a tropological warning to the audience about disobedience against ecclesiastical discipline and secular order.

Gentry

Although "gentry" began as a synonym for gentility and hence for the nobility as a whole, it has come to be used by historians to refer essentially to the lesser nobility as a subdivided landed class below the aristocracy.

Three basic gradations evolved: the knights, the esquires, and the mere gentlemen. The thinning of knightly ranks during the 13th century and their transformation into a territorial elite facilitated a system of social gradation that eventually become more clearly delineated. The esquires emerged as a definite second rank among the country gentry during the early to mid-14th century. The hard core of these came, beyond doubt, from a secondary thinning of the knightly class, from collaterals of the knightly families, and to some degree from the strata immediately below them. It was from these strata, too, that the third gradation, the gentleman, was ultimately born and brought to maturity by the Statute of Additions of 1413.

While the essence of the gentry was that of a landed elite with a shared and primarily military ethos, it came to include others with a claim to gentility (upwardly mobile professionals, for example, and scions of the established

gentry) who were not necessarily so endowed. Some historians would prefer to replace the medieval terminology with such divisions as parish gentry, county gentry, or upper gentry. In many of their activities as landlords, and in their way of life, the upper gentry in particular were not readily distinguishable, except in terms of degree, from the aristocracy, although the development of the parliamentary peerage during the 14th century tended to make the distinction more discernible. Among the debates that exercise historians of the gentry was their degree of dependence upon the aristocracy, the extent to which they were organized upon a territorial (essentially a county) basis, and their role in economic change.

Arguably, “gentry” has tended to be used too loosely; a full definition would need to comprehend a number of vital factors, including the following: 1) a territorial elite, based essentially on ancient land ownership but reinforced by upward mobility; 2) a degree of separation from the great landowners, while sharing with them a developed notion of gentility and a specific elite mentality, the latter drawing its force from a military ethos and even more from its trappings; 3) a system of fairly well defined social gradations; 4) a degree of devolved judicial authority, exercised collectively through commissions of the peace; 5) local office holding under the crown and a system of parliamentary representation that served to some degree at least both to enhance the sense of community and to bind this community to the central government.

This combination of characteristics crystallized during the course of the 14th century to produce a distinctive social formation. It might be better to restrict the term “gentry” to this period onward.

Geoffrey of Monmouth (ca. 1100–1155)

Author of the highly influential *Historia regum Britanniae* (*History of the Kings of Britain*). Probably born in Wales and possibly of Breton descent, Geoffrey lived in Oxford from 1129 to 1151, presumably as a secular canon at the College of St. George, where he was engaged in teaching. By 1151 or 1152 he had been elected bishop of St. Asaph in northeast Wales, although there is no evidence to suggest that he ever visited his Welsh see.

Geoffrey's first book, the *Prophetiae Merlini*, or *Prophecies of Merlin* (ca. 1135), purports to be a series of prophecies delivered by Merlin to the 5th-century king Vortigern and translated from British verse into Latin. The prophecies are retrospective, anticipatory, or apocalyptic: that is, some allude to events before Geoffrey's time; others to events that in 1135 seemed relatively imminent (e.g., the Norman conquest of Ireland); and still others to events that might be anticipated at the end of the world. Although the *Prophecies* stems mainly from Geoffrey's vivid imagination, parts of it betray a debt to native prophetic traditions and to such written sources as Lucan's *Pharsalia* and the Bible. Having circulated independently in a manuscript or manuscripts no longer extant, the prophecies were ultimately incorporated into the enormously popular *History of the Kings of Britain*, a Latin work that was probably completed in 1138 and survives in over 200 manuscripts.

Geoffrey claims that he translated his history of the Britons from the time of Brutus to the reign of Cadwalader from an ancient book in the Breton (or Welsh) tongue. That which Geoffrey did not simply invent for the purposes of his history, however, seems to be derived from not one but several sources. Much of his account of the founding of the British nation, for example, derives from Virgil and from Nennius's *Historia Brittonum*. The history of Britain from its founding by Brutus to the reigns of Uther Pendragon and Arthur would seem to derive largely from Welsh genealogies and legends. Geoffrey concludes his history with an account of the Saxon conquest that owes much to these same sources and to accounts of the conquest found in Gildas and Bede.

The impact of the *History of the Kings of Britain* on later literature has been considerable, for to this work we owe not only the vernacular *Bruts* of Wace, La3amon, and several Welsh poets but also some of the works of such

distinguished writers as Chretien de Troyes, Malory, Spenser, Tennyson, Morris, Twain, Swinburne, and E.A. Robinson. Much less influential was Geoffrey's last work, the *Vita Merlini*, or *Life of Merlin* (ca. 1150), a Latin poem recounting the story of Merlin's going mad after a battle and retreating to the forest of Calidon. He is visited there by his sister Ganiada, the learned bard Taliesin, and the latter's friend Maeldinus. Merlin eventually regains his sanity, whereupon he and his three visitors decide to end their days in the forest, engaging themselves in the pursuit of esoteric knowledge.

Because the central character of the *Life* is not the Merlin Ambrosius of the *History* but the Celtic Merlin Calidonus (or Silvester), Geoffreys tale of Merlin is thought to have originated in the Welsh prophetic and poetic traditions. Sources for the work, which contains numerous contemporary political allusions and extensive passages of learned or prophetic discourse, include Bede, Isidore of Seville, and material from Geoffrey's own *Prophecies of Merlin*.

Gerald of Wales (Giraldus Cambrensis, Gerald de Barri; ca. 1146-ca. 1223)

Archdeacon of Brecon, in the diocese of St. David's, Wales; historical and geographical writer. His writings include an autobiography, the lives of several Welsh and English saints, historical and geographical works about Ireland and Wales, and works on priestly responsibilities and ecclesiastical controversies. A disappointed candidate for the bishopric of St. David's, Gerald was an acute but often biased observer of contemporary secular and ecclesiastical politics; his works are interesting both for the opinions they express and their eyewitness observations. One of his works, the *Conquest of Ireland*, was translated into ME in the 15th century. Recently Gerald's writings have been studied to determine the combination and conflict of national and regional affiliations in late-12th-century England.

Glanville (Glanvill), Ranulf de (ca. 1120/30–1190)

Henry II's chief justiciar (chief judicial official and virtually the royal lieutenant), 1180–89, typical of the “new men” rising from knightly families to wealth and power in the king's service. Glanville's father, a Suffolk subtenant, left him but little land; marriage to a neighboring lord's daughter brought him more property. He began his career as sheriff of Yorkshire (1163), fell from royal favor in 1170, and regained favor with his dramatic capture of the Scottish king William the Lion during the 1173–74 rebellion by Henry II's sons.

Glanville became chief justiciar following Richard de Lucy's retirement from the office in 1179. He took responsibility for implementing Henry II's legal reforms, heading frequent circuits of itinerant justices around the kingdom and earning a reputation for learning and law. The law as administered during Glanville's justiciarship is recorded in the *Treatise on the Laws and Customs of England*, written ca. 1187–89, often called *Glanville* and long attributed to him. In fact he is unlikely to have authored the book, although he may have sponsored its writing by some lesser royal justice. Glanville retired or was dismissed from office on Richard I's accession, and he accompanied the king on his crusade, dying at Acre in 1190. He left no sons, but like other new men in the king's service he had brought other relatives into government, most notably his nephew Hubert Walter.

Glosses and Glossaries

Glosses are explanations, usually brief, of difficult words or expressions in a text, typically written in the margins or between the lines of text; glossaries are collections of glosses, drawn together for easier reference. Of the nearly 1,000 extant manuscripts written or owned in Anglo-Saxon England, roughly one-quarter contain OE glosses or Latin-OE glossaries. The number of manuscripts containing Latin glosses or Latin-Latin glossaries has not been reckoned but can be assumed to be significant. Often glossaries combine Latin-OE and Latin-Latin glosses. Glosses can be divided into a number of categories: 1) lexical glosses, which generally provide synonyms; 2) commentary glosses, a category that subsumes within it encyclopedic, etymological, and interpretive glosses; and 3) grammatical glosses, often used to clarify grammatical relationships or provide alternative forms.

To these categories may be added syntactical or “construe,” glosses in which dots, flanking signs, “paving letters” (interlinear letters serving as syntactic notation), and various other forms of notation are used to clarify syntax. Less within the scope of glosses and glossaries, but noteworthy nonetheless, are “glosses” indicating stress in prosody and typically taking the form of acute accents (Wieland, 1984). These are not to be confused with tonic accents indicating syllabic stress. Glosses may be written in ink or recorded as scratched glosses, where a drypoint stylus is used to scratch the gloss into the vellum. This practice is commonly found among interlinear glosses but also occurs in glossaries (e.g., BL Arundel 60, fols. 8v-l lr, margins).

Among glossed texts can be distinguished those that bear a continuous gloss and those containing occasional or sporadic glosses. Scattered or occasional glosses are ubiquitous and are not confined to any particular category of texts. Over 30 manuscripts contain Latin texts that are accompanied by a continuous interlinear OE gloss. The bulk of these manuscripts are liturgical or paraliturgical, of which the psalters (with canticles) constitute the largest group, with eleven psalters carrying a complete continuous gloss, one a continuous gloss for selected psalms, two containing sporadic glosses, and two glossed binding strips.

The psalms of the Lambeth Psalter (Lambeth Palace Library 427) are useful

in illustrating the variety of different methods of glossing. The gloss, for the most part, is word-for-word, with synonyms often supplied, for example, *in terris: on eorðan uel landum* (Ps. 48:12). Grammatical glosses typically take the form of the insertion of “o” to indicate the vocative case, as in *deus: o god* (Ps. 50:15). Lexical and interpretive glosses, the latter drawn mainly from the commentaries on the Psalms by Cassiodorus, Augustine, and Pseudo-Jerome, occur throughout: *in inferno: on helle id est in tartaro* (Ps. 6:6), *syon: sceawere id est sanctam ecclesiam* (Ps. 2:6). The psalter also includes a variety of elliptical compound glosses: *nequita: man uel niðscipe* (Ps. 8:10), where the first word is completed by the second element of the second word (i.e., *manscipe uel niðscipe*). Analogously we find *blodgita uelgeotende* (i.e., *blodgita uel blodgeotende*; Ps. 5:7). Syntactical glosses, usually taking the form of an inserted *est: is* (or other forms of *sum: beorí*) occur commonly. The psalter also makes use throughout of subscript dots, flanking signs, and the like to indicate “syntactical glossing.” The continuous gloss to the Benedictine Rule in BL Cotton Tiberius A.iii offers a system based on the use of letters of the alphabet to indicate word order, a practice found elsewhere in the corpus.

Roughly 65 glossaries containing OE are extant, the most important of which are the Corpus, Épinal, Erfurt, Leiden, Werden, Cleopatra, Otho, and Harley glossaries (Ker, *Catalogue*, 1957: items 36, 114, 143, 184, 240, App. 10, 18, 39). Glossaries offer a number of systems of arrangement, such as *a* order (alphabetized by first letter) or *ab* order (alphabetized by first two letters), or they may be arranged as class glossaries under specific headings, for example, *De avibus*, *De piscibus*, *De metallis*, which may also include “batches” of glosses, the sources of which can often be traced to particular works, such as Isidore of Seville’s *Etymologies* or the Bible. A combination of ordering systems is usually the norm. Glossaries may be written in columns or in long lines, or a combination of both. They may offer pairs of lexical items (i.e., lemma and gloss; e.g., *anxius: sorgendi*), multiple synonyms (e.g., *Effectus id est factus, operatio, portatus*, etc.), or extended definitions (e.g., *Corporeum est quicquid constat ex corpore*). While nearly all of the Latin-OE glossary entries have been printed, the publication of Latin-Latin glossaries and Latin-Latin glosses entered alongside Latin-OE glosses remains a desideratum in the field of glossography, despite the early work of Goetz, Lindsay, and Du Cange.

Gloucester

Its proximity to Wales and the Midlands, its network of fine roads, and its position on the upper Severn gave this city a natural commercial and strategic importance throughout the Middle Ages. Though there is little firm evidence of its continual occupation between the departure of the Romans in the 5th century and the Norman Conquest, Bede described it as “one of the noblest cities in the kingdom [of Mercia].” By the Conquest it had become the preeminent city of the west Midlands, favored by kings and nobles alike.

In economic terms pre-Conquest Gloucester served as a commercial center for the entire west Midlands. It had a royal mint, supplied goods and services to its two monasteries (St. Peter’s and St. Oswald’s), and manufactured iron implements from ore in the forest of Dean. William I considered it a royal city, with Winchester and Westminster, ensuring its continued growth and importance. Extrapolations from Domesday Book suggest a population of some 3,000 in the late 11th century. The addition of a castle and expansion of both religious houses sustained its position. By the early 12th century, with an economy based on trade, services, manufacture of cloth and iron, a rich fishery

on the Severn, and a Jewish community to provide financial services, Gloucester can be reckoned as one of the ten wealthiest cities in the kingdom.

The national population decline of the early 14th century, caused by climatic change, poor harvests, and especially the Black Death, hit Gloucester hard, though it recovered relatively quickly. Over the longer span its position relative to other centers, as measured by assessed taxes (in 1334), tax-paying population (in 1377), and subsidy paid to the crown (in 1523–27), remained remarkably steady, moving in rank only from sixteenth to fifteenth to seventeenth, respectively.

Yet by the mid-15th century, along with many other towns, Gloucester entered a period of prolonged decline. We read of pestilence, corporate impoverishment, and decayed houses (300 dwellings alone were cited as decayed in 1487–88). Though this may be attributed to factors that applied to many towns at that time, Gloucester suffered an additional wound when, with the pacification of Wales, it lost much of its strategic importance; its castle was razed in 1489, royal visits became infrequent, and even the abbeys went into decline.

Politically Gloucester enjoyed the status of a royal borough from the Conquest, but the crown shared its lordship with several others. Its first important charter, from Henry II, granted the right of fee farm (the annual fee due to the king) and freedom from toll. Despite an abortive attempt to form a commune in the 1160s the Guild Merchant (the ruling oligarchy of powerful merchants) retained sufficient local power to erect a guildhall in 1192 and to gain a full charter of liberties in 1200 for those parts of the town held of the crown. Shortly thereafter Gloucester became the county town, hosting the annual courts and in 1278 even a parliament. The apotheosis of Gloucester's medieval political development came with its acquisition of county status in 1483 and its incorporation in 1541.

Gloucester Candlestick

This candlestick (London, Victoria and Albert Museum M.7649–1861) consists of three separate sections of cast and gilded copper alloy: a triangular base with dragon feet and a lower knob; the shaft, decorated with foliage inhabited by beasts and human figures, with the four evangelists' symbols on a central knob; and a drip pan supported by dragons. There are three Latin inscriptions, translated as: "The gentle devotion of Abbot Peter and his flock gave me to the Church of St. Peter at Gloucester"; "This flood of light, this work of virtue, bright with holy doctrine, instructs us, so that man shall not be benighted by vice"; and (of later date) "Thomas of Poché gave this object to the Church of Le Mans when the sun renewed the year."

This exquisite candlestick (fig. 67) is a rare example of a dated medieval object, the first inscription indicating that it was commissioned by Peter, abbot of Gloucester (1107–13). It is also one of the earliest altar candlesticks to survive, close in design to 11th-century Ottonian examples, particularly those made ca. 1000 for Bishop Bernward of Hildesheim.

The decoration of the candlestick is stylistically close to English manuscript illumination of the 11th and 12th centuries. However, although it is accepted as having been made in England (perhaps Canterbury), the evidence is inconclusive regarding the center of production. The secular decoration has been interpreted, in relation to the second inscription, as illustrating the struggle between good and evil. The date of the third inscription is disputed but is possibly from the second quarter of the 12th century.

Gloucester Cathedral

The Benedictine abbey church (now cathedral) of St. Peter at Gloucester ([fig. 68](#)) is a fine example of the West Country School of Romanesque architecture that developed independently from works like Winchester Cathedral, inspired by St. Étienne at Caen. It was commenced by Abbot Serlo in 1089, was built as far as the nave by 1100, and was probably completed ca. 1130. The original fabric is considerably remodeled: the nave vault dates from 1242; the south nave aisle was rebuilt after its Norman predecessor threatened collapse in 1318, and, starting in 1331, the transepts and presbytery were remodeled with lierne vaults and large clerestory windows, while a tracery veneer was hung in front of the Romanesque arcades and galleries.

The apse of the three-bay Romanesque presbytery was destroyed in the Perpendicular rebuilding, but traces of arch springers on the apse-chord piers and the excavation of the two eastern piers provide evidence for a three-sided apse like the extant example at Tewkesbury Abbey. Sainte Croix at Loudun (Vienne), ca. 1060, provides a model for this motif and for the ambulatory with polygonal chapels and the large columnar piers. Two-story radiating and transept chapels, and the groin-vaulted crypt that extends under the entire presbytery, follow Worcester Cathedral (1084–89).

Settlement in the crypt soon necessitated the reinforcement of its main arcades, aisle responds, and vaults, the latter involving a rare structural use of diagonal ribs. The presbytery aisles are groin-vaulted and have plain transverse arches, carried on cushion capitals atop half-shafts that are flanked by continuous quadrant moldings of the wall arches. This alternation of continuous and noncontinuous orders remained a favorite of West Country masons into the 13th century. The quadrant vaults in the presbytery galleries were probably intended to abut the thrust of a high vault, but the form of this vault and the Romanesque elevation above the galleries are problematical. The

apse probably had a four-part rib vault, while the straight bays may have had a barrel vault over a two-story elevation, a one-story version of which exists at Ewenny Priory, a daughter house of Gloucester. Alternatively there may have been a three-story elevation and a groin vault, as in the presbytery of Hereford Cathedral. The three-story aisleless transepts were wood-roofed, and the ground story of their chapels has complex groin vaults.

The nave elevation contrasts with the equally proportioned main arcade and gallery in the presbytery. It has a tall main arcade with columnar piers, a triforium, and (remodeled) clerestory with wall passage. Similar contrasts between presbytery and nave elevations occur locally at Tewkesbury and Pershore abbeys and Hereford Cathedral. The north nave aisle preserves its Romanesque rib vault with monumental five-shaft responds. The rich articulation of the nave with twin soffit rolls to the main arcade and a wealth of chevron ornament set at right angles to the wall contrasts with the plain presbytery. Evidence remains for a Romanesque high rib vault carried on grouped shafts on the triforium sill like those above the columnar piers of the presbytery at Durham Cathedral.

Fig. 68. Gloucester Cathedral, nave interior. RCHME, © Crown copyright.

Of the Romanesque monastic buildings the barrel-vaulted eastern and western slypes remain. There is a barrel-vaulted room above the western slype and the richly arcaded chapter house, which is vaulted with a pointed barrel.

Godric's Songs

Three monophonic religious songs of the mid-12th century ("Sainte marie viergene," "Kirieleisón: Crist and sainte marie," and "Sainte Nicholas Godes druth") that are the earliest English-language lyrics to survive with their melodies; found in a number of manuscript sources, including three with music, they are also known as Godric's Hymns. Their composer, St. Godric (ca. 1070/80–1170), wrote them some time after he retired to a hermitage at Finchale, north of Durham, following a career as a merchant trader and ships captain. Godric's life as a hermit was one of ascetic hardship, punctuated by visions in which the songs were taught to him; he later sang them to his future biographers. In respect to style the settings are reflective of certain contemporaneous Latin hymns in rhyme, meter, and melody.

Godwin, Earl of Wessex (d. 1053)

An Anglo-Saxon favorite of King Cnut (1016–35), who gave him the earldom of Wessex and his sister-in-law, Gytha, in marriage. Godwin was a proponent of Anglo-Danish interests after Cnut's death and may have been indirectly involved in the murder of Æthelred II's son Alfred, a main competitor with Cnut's son Harold for the English throne. Edward the Confessor, Æthelred's son, whose claim to the throne was made good in 1042, adopted a conciliatory approach toward Godwin and heaped favors on his family. The king married Edith, Godwin's daughter, in 1045, and he entrusted Godwin's sons with the regional authority of earls.

Godwin seems to have dominated the events of Edward's reign, and he strongly influenced domestic and foreign policies. Some see the source of Godwin's power in the tremendous landed resources of his family; altogether "the Godwins" held over 6,300 plowlands with an annual income of £5,159. The Confessor's landed wealth paled by comparison; 5,100 plowlands, worth £3,605 a year. Furthermore the Godwins' estates were located in militarily sensitive areas, since, as earls, they were responsible for regional defense. Hence they enjoyed easy access to important roads, like fosseway, Ermine Street, and Icknield Way, and controlled key defensible sites. One can hardly study Godwin without his children, for the Godwins supported their father's endeavors to the extent of joining him in revolt against the king in 1052.

Initially Edward seems to have needed Godwin, but Godwin's earlier opposition to the Anglo-Saxon royal dynasty created a nagging suspicion of disloyalty. Edward's distrust eventually manifested itself as he turned from the Godwins to Norman friends. By 1046 Edith was no longer witnessing Edward's charters, and Godwin's authority—roughly that of a 12th-century vice-regent—was supplanted by that of Robert of Jumièges, Norman archbishop of Canterbury. Relations, already strained, were not helped by Swein Godwinson's revolt in 1045. In 1046 Godwin and his family protested Edward's favoring of Normans; Edward retaliated with a threat of force. Three years later the king, acting on information that Godwin was plotting his death, went so far as to exile the Godwins and to commit Edith to a nunnery at Wilton or Wherewell.

Godwin's spectacular rise to power might be explained by his ambition and his ability; he was noticed by Cnut and proved indispensable. Cnut was a forceful man who could be surrounded by strong personalities, but Edward was overshadowed both in influence and landed wealth. The events of 1051 might be understood in this light. Moreover, if Edward and Edith had had children, Godwin's position, as grandfather to the heir, would have been much

more secure. But they did not, for reasons about which we can only speculate, and Godwin's position deteriorated so much that within a decade of Edward's accession (in 1042) Normans at court formed an anti-Godwin faction. Edward was probably uncomfortable with Godwin's avowed Danish sympathies and feared a coup of sorts. But the king misjudged Godwin's tenacity and the extent of his support.

Godwin clearly had too much to lose to accept dispossession. In 1052 he launched attacks on England from Flanders (where Count Baldwin was an ally) and from Ireland, where Harold Godwinson had collected an army. Godwin seems to have had a huge following at home, and he used this to apply pressure on Edward. Godwin was able to face his accusers at court and to clear himself.

Then, the Anglo-Saxon Chronicle explains, "Godwin was given his earldom unconditionally, and as fully and completely as he had ever held it, and all his sons all that they had held before, and his wife and daughter as fully and completely as they had held it before." But Godwin did not enjoy his victory for long; he died in 1053, succeeded as earl of Wessex by his son Harold.

Gower, John (13307–1408)

Poet and friend of Chaucer. Gower was probably born of a Kentish family during the third decade of the 14th century. He may have attended the Inns of Court, perhaps with Chaucer, acquiring legal training possibly put to use in land dealings recorded of a “John Gower” in the Close Rolls ca. 1365–74. We have better evidence that Gower the poet owned lands in Norfolk, Suffolk, and Kent by 1382 and that he was familiar enough with the Lancastrian house to be awarded a collar of silver “SS” links upon the ascension of Henry IV in 1399.

In his later years Gower took an interest in the monastery of St. Mary Overeys in Southwark, apparently restoring several of its buildings with his own and friends’ money. Sometime after 1377 he took his residence there, probably as a lay brother, for he did not join the order. On 23 January 1398 Gower received a license from the see of Winchester to marry one Agnes Groundolf (probably his nurse) at his house on the priory grounds. Gower’s will, dated 15 August 1408, divides substantial property among several religious houses and his wife. It gives no evidence of an earlier marriage or of children. An elaborate tomb, surmounted by a near-life-sized effigy wearing the “SS” collar, representations of his three major works, and protective angels, rests in the north aisle of St. Saviour’s Church, Southwark.

A prolific and versatile writer, Gower composed nearly 80,000 lines of poetry in French, Latin, and English. Although the chronology of individual works remains imprecise, it is generally thought that his earliest compositions were in Anglo-Norman and that his English poems were the product of the last two decades of his life. He continued to write in Latin and French until the end, however, making him a truly trilingual poet—an achievement unique among English literary figures.

French Works

Of the French poems the earliest and longest is commonly known by the title *Mirour de l’Omme*. (Alternative names are *Speculum Hominis* or *Speculum Meditantis*, but these are used infrequently.) The *Mirour* exists in one manuscript only, copied by a single hand: CUL Add. 3035, presently containing 28,603 lines, but missing at least a dozen leaves. It seems likely that the complete poem consisted of approximately 31,000 lines. The *Mirour* is written in twelve-line stanzas of octosyllabic verse, rhyming aab aab bba bba.

The subject of the *Mirour de l’Omme* is the complete moral life of man. To describe this Gower created a poem in three parts, unequal in length but

seemingly equivalent in import. The first section—about two-thirds of the work—presents a complex but familiar allegory: the begetting of Death by the Devil on Sin, his own daughter; the subsequent coupling of Sin and Death to produce seven “daughters,” the deadly sins or Vices; the marriage of the World to the seven Vices, as a strategy to beget helpers to seduce Man; their mutual assault on Man; the prayer of Conscience and Reason to God for assistance; the divinely arranged marriage of the seven Virtues to Reason, and the description of their daughters; the oppositional pairing of the Virtues and their offspring against the Vices and their offspring. The second section considers how the battle of good and evil is going in the world. The Three Estates—clergy, knights or lords, and peasants—are subdivided and examined, from pope to parish priest, emperor to laborer; all are found thoroughly corrupt and incapable of reforming themselves without merciful grace. The poem concludes with a third section describing the source of this extraordinary succor—the Virgin Mary, whose life, joys, and sorrows are related in some detail. The final lines of the *Mirour* as we have them are the poet’s prayer to the Virgin for mercy and a list of her names and titles, cut short by the missing manuscript leaves.

Gower’s remaining French poetry consists of two sequences of ballades, one generally known as the *Cinkante Balades*, the other as the *Traitié pour Essampler les Amantz Manetz*, or simply the *Traitié*. Although an early date was once assumed for the *Cinkante Balades* and a late one for the *Traitié*, in fact no firm evidence exists to establish when, or in what context or order, Gower composed these poems. Theories connecting the former sequence with a still-flourishing merchant *puy* (a bourgeois literary and social organization) in London, or the latter with Gower’s marriage (whatever might be true of individual ballades), are without firm foundation. The *Cinkante Balades* (*Fifty Ballades*), despite the title found in its unique manuscript, actually contains 54 poems, each in seven- or eight-line stanzas and almost all with standard four-line envois (short closing stanzas). The poems trace the correspondence of two lovers during an affair, with both a male and female voice represented. The collection is overdy critical of amoral dalliance and seems created to offer alternative images of love and love poetry compatible with Christian marriage.

The eighteen ballades known as the *Traitié* repeat the same firm directives concerning the unique propriety of lawful affection and (by extension) poetics. These poems, each consisting of three seven-line stanzas without envoi, exist in ten manuscripts, never alone. On eight occasions they follow Gower’s major English work, the *Confessio Amantis*, and would seem, if the French prose introduction and the Latin prose sidenotes are authorial, to have been intended as a sort of a coda or conclusion to the *Confessio*. Because the *Traitié* ends with a Latin poem in which Gower speaks of his own impending marriage, the sequence has sometimes been considered a late work, possibly composed in

1398, though some of its ballades may have actually been written earlier, without relation to the marriage.

Latin Works

Gower's independent extant Latin poetry amounts to somewhat fewer than 13,000 lines, mostly in unrhymed elegiac couplets. By far his most significant Latin poem is the *Vox Clamantis*, the title of which derives from the "vox clamantis in deserto" ("a voice of one crying in the desert") of John 1:23. Spanning 10,265 lines, it is known in ten manuscripts, of which four are contemporary with the author and probably show signs of personal revision. Although dating is uncertain, the *Vox* seems motivated by the social unrest resulting in the Peasants' Revolt of 1381.

The *Vox* resembles classical models in form, being arranged in seven books. This structural neoclassicism is supported by Gower's incorporation of many lines borrowed intact from Roman authors, primarily Ovid, and such medieval authorities as Alexander Neckham (in particular his *De vita monachorum*) and Peter Riga (author of the *Aurora*, a versified Bible).

The contents of the *Vox* may be summarized briefly as follows. Book 1 ("Visio") relates a horrific dream of the author, who witnesses the destruction of "New Troy" by anthropomorphic animals. In fear for his life the dreamer flees, first on foot and then by ship; after storms and attacks by monsters the ship eventually regains port, on the island of "Brute," from which the journey began. The dream is usually read as a thinly disguised allegory of major figures and events in the Peasants' Revolt. Book 2 describes human misery, condemns Fortune and her misperceived power, and concludes by reaffirming the Christian view of the order of things and urging its readers to hold fast to their Christian faith.

In the next three books the degeneracies of the Three Estates are enumerated (somewhat in the manner of the *Mirour*), beginning with the clergy (books 3 and 4), then treating the knights and peasants (5). Book 6 addresses the failures of the "ministers of law"; it concludes with extensive advice to the king, as chief guardian of the nation and its legal tradition. Finally, in book 7, the statue of Nebuchadnezzar's dream from the second chapter of Daniel (one of Gower's favorite metaphors) is used to focus discussion on the sinfulness of man and his precarious mortal circumstances. The *Vox* ends with a pointed (and poignant) appeal to the English to follow the advice of the dream and make their country a place of peace and decency.

Of next importance after the *Vox* is the *Cronica Tripertita*, written in

leonine hexameters (hexameter lines with internal rhyme). It treats the failed government of Richard II, brought down by treachery and weakness, and celebrates the new order to come under his successor, Henry IV. Besides these two longer poems Gower's Latin poetry includes about twenty short pieces on political, moral, and personal themes, and the Latin verses interposed throughout the *Confessio Amantis*.

English Works

Gower's ME verse consists of two poems, the *Confessio Amantis*, his best-known and most admired work, and "To King Henry IV, In Praise of Peace." Comprising some 33,000 lines, the *Confessio* was frequently copied (over 40 manuscripts survive) and later was among the earliest books printed in England, with blackletter editions by Caxton (1483) and Berthelette (1532 and 1554). The text exists in a variety of versions, the exact relationship of which is presently under fresh study. The best manuscript of the poem seems to be Bodl. Fairfax 3, on which the best scholarly edition (Macaulay's) is based.

With the *Confessio* Gower helps establish his native language as a medium for poetry while displaying extraordinary erudition and reaching new levels of fiction making and characterization in English poetry. The poem consists of a prologue and eight books, all in tetrameter couplets except for some twelve rime royal stanzas in book 8 and occasional Latin verses highlighting the themes of the poem. The framing fiction is, as the title indicates, the confession of a lover ("Amans") to Genius, the priest of Venus. Each of the books is concerned with one of the seven cardinal sins and its branches, except book 7, which rehearses the education given Prince Alexander by Aristotle. In the process of the lover's confession Amans and Genius grow as characters, becoming multidimensional by the end; in addition many stories are told, primarily by Genius, who uses them to illustrate his moral points to Amans.

While the sources of the *Confessio Amantis* are understandably too numerous to list completely, its broad outline suggests major debts to the *Roman de la Rose*, manuals of the penitential tradition, such as the *Somme le roi*, Lucretius's *De rerum natura*, and Boethius's *Consolation of Philosophy*. To these may be added a thorough acquaintance with the works of Ovid, Statius, the *Aeneid*, the *Ovide moralisé*, the *Legenda aurea*, and Brunetto Latini's *Trésor*.

The *Confessio Amantis* opens with a prologue in which the author attributes the anarchy of his times to corrupt leadership and division within society. Central to the opening is Nebuchadnezzar's dream from the book of Daniel

(2:31–45), concerning the giant statue of gold, silver, brass, steel, and clay, symbolizing the decline of civilization. The prologue concludes with a prayer that a new Arion (a legendary harper of classical mythology) might be found to bring back the golden age of peace and harmony with his musicianship. Book 1 sets the frame for the poem itself. The poet, lovesick and seeking solace, goes one May morning into the woods. He prays to Cupid and Venus, the king and queen of love, who then appear to him; Cupid pierces his heart with a fiery dart, and Venus commands him to confess his sins to Genius, the priest of love. Genius presents his method: he will question Amans concerning his sins, after the manner of a confessor; but since he is a priest only of love, he will speak of sin only as it affects love. The remainder of book 1 is devoted to describing several “branches” of Pride (Hypocrisy, Disobedience, Presumption, Boasting, and Vain Glory), each made memorable by one or more illustrative stories, or exempla, of varied length and complexity. The last section of book 1 offers a description of Humility, Pride’s opposing virtue, and an exemplum of humble behavior.

This pattern—the subdivision of a sin into its branches, the use of exempla to illustrate these branch sins, and (usually) the presentation and illustration of a major opposing virtue—recurs in books 2 through 6, which cover Envy, Wrath, Sloth, Avarice, and Gluttony. Book 3 also includes a digression in which Amans inquires about the morality of war, a question of great importance to Gower. Book 7, on the education of Alexander, devotes most of its space to a *speculum principum*, or “mirror for princes,” in which five “points of policy” (Truth, Largesse, Justice, Pity, and Chastity) are identified as the central elements of good kingship. Again exempla of varying length illustrate the points under discussion. Book 8 turns to Lechery, the remaining cardinal sin, focusing almost entirely on a single branch sin, Incest. For most of the book Genius tells the tale of Apollonius of Tyre, which illustrates not merely the commission and avoidance of incest and lechery but also the other six sins and their opposing virtues. Book 8 thus simultaneously explores the worst kind of lechery and effectively recapitulates the themes of the first seven books.

Following his confession Amans again meets the Queen of Love and identifies himself at last as “John Gower.” Surprisingly Venus now holds up a mirror so that the lover can see that he is old, and unfit for the kind of dalliance he pursues. She also removes the fiery dart from Amans’s heart, releasing him from his passion. Finally Genius absolves Amans and Venus gives the cured lover a set of beads and the admonition to “pray for the peace.” In the poem’s closing lines we are returned to the universal themes of the prologue, including the evils of division and the hope for good kingship and loving harmony in society.

“To King Henry IV, In Praise of Peace” is Gower’s only other extant English

poem. Containing 55 rime royal stanzas, it occurs in one manuscript version (BL Add. 59495, the Trentham Manuscript) and was printed by Thynne in his 1532 edition of Chaucers *Works*. As in the *Confessio* Gower's pacifistic concern for an end to domestic and international strife receives a prominent place.

Although Gower has been slighted by modern critical opinion (usually, indeed, dismissed as "moral Gower," as Chaucer calls him, albeit with no denigrating intent, at the conclusion of *Troilus*), recent scholarship is returning his work to its earlier prominence. Clearly Chaucer's most significant poetic confidant, Gower appears to have influenced his friend at least in the tales they tell in common, notably those of "Constance" (*MLT*), "Florent" (*WBT*), "Phebus and Cornide" (*ManCT*), and "Tereus" ("Philomela" in *LGW*). For "Constance" and the *Man of Law's Tale* it is thought that the two friends exchanged drafts of their work, with Gower's assumed to be the earlier version.

Gower's reputation remained high during the 15th century, his name appearing in paeans by Lydgate, Hoccleve, Henryson, Dunbar, and others as a cofounder, with Chaucer, of the national poetic language. In the 16th and 17th centuries his work was praised and plundered by Spenser, Milton, and Shakespeare (whose *Pericles* adapts the "Apollonius of Tyre" story and brings "Ancient Gower" onto the stage as chorus). A moralist and scholar, Gower is often lauded for the spare, no-nonsense approach he takes to narration—a quality especially visible in the *Confessio Amantis*—and he is increasingly perceived as an independent literary theorist with strong views as to the role poetry might play in making a just, peaceful society.

Grammatical Treatises

These treatises have their roots in late-classical grammars, especially in Donatus's *Ars minor* (4th century) and Priscian's *Institutiones* (ca. 500). These and other classical treatises were transmitted to the Middle Ages through the Christian monastic tradition and were probably brought to Britain by missionaries from Ireland during the 6th century. Alongside the classical texts stood christianized variations, such as the *Ars Asporii*, and practical teaching aids, like the *Declinationes nominum*. The *Anonymus ad Cuimnanum*, *Ars amhrosiana*, and the work of Malsachanus and perhaps Virgilius Maro Grammaticus are also attributable to 7th- and 8th-century Ireland or Irish centers on the Continent. The treatises are surrounded (as in all periods) by marginal and interlinear grammatical annotation to reading texts and isolated notes and comments: even by Donatus's time Latin was a book language.

This bookishness also shows itself in some texts, like the *Hisperica famina*, as an almost whimsical inventiveness in vocabulary and style; a still more complex invention characterizes the writing of the Anglo-Saxon scholar Aldhelm (d. 709/10), who may have learned his grammar from an Irishman named Máelduib as well as the Roman missionaries Theodore and Hadrian. Among the first Anglo-Saxons to write grammatical treatises as such was Bede (d. 735), a monk at the Northumbrian foundation of Wearmouth-Jarrow. His treatises on orthography, meter, and schemes and tropes (figures of speech) represent a pragmatic application of grammar to the needs of monastic life.

Bede's southern English contemporaries Archbishop Tatwine (d. 734) and the missionary Boniface (d. 754) also saw the production of grammars as part of their clerical duties. Their grammars are different in style, the one traditional, the other novel and highly wrought, but both have the functional aim of opening up the full meaning of scripture and the services of the church. They re-present, concisely and systematically, the facts of a contemporary ecclesiastical Latin that had changed sufficiently from its classical forms to warrant such new work.

With Boniface the cultural initiative passes to the Continent, although the

Englishman Alcuin (d. 804) played an important part in establishing a newly uniform latinity and higher standard of literacy throughout Charlemagne's empire, "in order that those who aim to please God by living correctly should in addition not fail to please him by speaking correctly" (mandate of Charlemagne to Baugulf, abbot of Fulda, ca. 795).

In the late 9th century King Alfred made a conscious attempt to follow Charlemagne by sponsoring a similar revival in England. Observing that "there were very few who could understand their [Latin] services in English, let alone translate a letter into English from Latin," he sought to have "the works that are most necessary to know" translated into the vernacular. Alfred's educational program did not include the production of any grammatical texts, but some 100 years later it found its fulfillment in Ælfric's *Grammar*, the first grammar of Latin to be written in English and the earliest known in any vernacular. Ælfric's work is marked by careful English neologisms for Latin grammatical terms and the occasional recognition of differences between the two languages: "words are often of one gender in Latin and another in English: we say *hie liber* [masculine] in Latin but *peos boc* [feminine] in English."

The Norman Conquest left Ælfric's grammar as an isolated flowering of the vernacular, not to be emulated for three centuries. The mainstream of development continued on the Continent, with a move in the late 11th century toward commentary on Priscian. Such writers as Anselm of Laon and Manegold of Lautenbach (Chartres?), followed by William of Conches and Petrus Helias, absorbed the rediscovered writings of Aristotle and established linguistic science as the foundation of the new university curriculum. "Why?" not "What?" became the primary focus of study.

The rise of Oxford University in the 13th century brought these texts to England but also saw the growth of a particularly English scientific approach to grammar, to which Robert Grosseteste, Robert Kilwardby, and Roger Bacon bear witness. Articulatory phonetics, performative and contextual semantics, and phoneme theory give a surprisingly modern ring to their work. It was, however, a group of Danes in Paris who developed the most fascinating treatment of syntax and semantics in the speculative grammar of the last years of the 13th century. Using lexeme and feature analysis and a many-layered approach to meaning, they attempted to develop a universal theory of semantic structure.

Thomas of Erfurt's *Grammatica speculativa*., which shows this tradition in a fully developed form, was in use at Oxford University in the 14th century. The native grammars of this period show occasional signs of his influence but are in general both more traditional and more pragmatic in intent. This was also the case in Italy, so that such works as John of Genoa's *Catholicon* (1286) circulate in England together with the works of Richard of Hambury, Adam

Nidyard (or Shidyrd), Thomas of Hanney, and John of Cornwall. John of Cornwall is also noteworthy as the first grammar master to teach Latin grammar in English rather than French, beginning sometime after the outbreak of plague in 1349.

Alongside the growth of theoretical grammar came new pedagogic treatises in verse, including Alexander of Villedieu's *Doctrinale*, Eberhardt of Béthune's *Graecismus*, and the works of the Englishman John of Garland, all of which circulated widely throughout Europe. Garland also produced works on vocabulary, and his *Dictionarius* may be the first to have borne that name.

Increasingly, however, in the late 14th and 15th centuries, the *Summa* or *Speculum* offering a compendious treatment of grammar gave way to a plethora of short, specific treatises. These circulated in the increasing number of local grammar schools and were often adapted by local masters. The availability of paper meant that masters and pupils alike could compile their own selection of grammatical texts. Out of this fluid situation grew the first clearly stated ideas of curriculum and graded texts, the most elementary of which were written in the various European vernaculars, including ME.

In England these developments and some of these vernacular treatises are associated with the teaching of John Leylond (or Leland; d. 1428) in the schools attached to Oxford University; such schools and teaching made it possible for a would-be schoolmaster to acquire a bachelor of grammar degree, much as a teaching certificate would be acquired today. It was in this environment that the standard textbook grammars of the modern period began to develop, most of them still visibly grounded in Donatus and Priscian. At the elementary level, if not the theoretical, grammar teaching shows remarkable continuity from its roots in the 4th century right through to the present day.

Great Bibles, Romanesque

Illuminated Bibles of large format, often in two or more volumes, came into vogue in England in the 12th century, paralleling a similar development on the Continent. Some of these, such as that written and illuminated at Bury St. Edmunds ca. 1135 by Master Hugo (Cambridge, Corpus Christi College 2), served as lectern Bibles, to be read during meals in the refectory. Eight major examples were extensively decorated, either with ornamental capital letters, or historiated initials containing biblical scenes, or miniatures, or a combination of any of these.

Various pictorial sources have been proposed for the illustrations. In general, because of the prevalence of copiously illustrated early Octateuchs (the first eight books of the Old Testament, Genesis to Ruth) in the Byzantine East, scholars have traced compositional and iconographical groupings in English 12th-century Bibles to manuscripts from this area. In addition the Byzantine practice of introducing the books of the prophets with portraits of their authors was also emulated in the English Bibles, although this tradition may have been transmitted by continental intermediaries. For other books of the Old Testament, however—Kings, Esther, Judith, and Maccabees, as well as the less frequently illustrated sapiential books of Proverbs, Ecclesiastes, the Song of Songs, Wisdom, and Ecclesiasticus—the pictorial sources seem to be primarily western, from manuscripts originating in the Meuse Valley and Burgundy.

Although some patterns in the placement of decoration were becoming

standardized, considerable variety was exercised in the presentation of the illustrations as well as in the selection of individual scenes. The simplest pattern of decoration was to provide decorative or historiated initials before each of the books, perhaps with smaller decorative initials before their prologues. A variation of this system is found in the earliest illuminated English Bible of ca. 1100, now divided between the libraries of Lincoln Cathedral (A.I.2) and Trinity College, Cambridge (B.5.2), where 86 foliate and thirteen figurative initials introduce the books and many of their prologues. The Dover Bible (Cambridge, Corpus Christi College 3–4) reveals the same pattern and similar uniformity of decoration, with, however, an increased richness of imagery in its 38 historiated initials in contrast to nineteen decorative ones, mostly in the second half of the manuscript.

This arrangement of decoration also serves as the basis for the spectacular Winchester Bible (Winchester, Cathedral Library), begun perhaps around 1150 and continued to about 1180 by several different artists, probably at the Cathedral Priory of St. Swithun. Here 51, perhaps as many as 58, historiated initials introduce almost every book, as opposed to only sixteen decorated ones for lesser divisions. To this arrangement were added, however, miniatures as frontispieces to Judith and to 1 Maccabees and, perhaps intended to be inserted but never used, two miniatures to the book of Samuel on a single leaf (now New York, Pierpont Morgan Library M.619). This dramatic pictorial emphasis upon these three books *vis-à-vis* the relative uniformity in the consistent use of historiated initials to introduce the books in the rest of the manuscript has not yet been adequately explained.

In two other lavishly illustrated 12th-century Bibles, however, the distribution of miniatures and decorations is more irregular, raising the possibility of a programmatic pictorial emphasis. The first of these, the Bury St. Edmunds Bible cited above (CCCC 2), originally contained twelve miniatures (only six have survived), three historiated initials, and 39 elaborate decorated letters. The first seven books, perhaps reflecting a tradition of illustrated Pentateuchs, would have been introduced by miniatures. In addition miniatures prefaced 1 Samuel, Isaiah, Jeremiah, Ezekiel, and Job, while historiated initials of Isaiah, Amos, and Micah open the texts of their appropriate books. This concentration of images, in contrast with the usual openings of decorative letters, appears to place a pictorial emphasis on the early historical books, and on the linking of the Law and the prophecies through the illustration of the birth of Samuel, the last of the great judges and first of the prophets, and on the four major prophets.

Fig. 69. Lambeth Bible (London, Lambeth Palace 3), fol. 198. Tree of Jesse. Reproduced by permission of the Archbishop of Canterbury and the Trustees of Lambeth Palace Library.

An even more elaborate, but selective and focused, program of illumination is found in the Lambeth Bible (London, Lambeth Palace Library 3 and Maidstone Museum 70), believed by some scholars to have been illuminated at

St. Augustine's, Canterbury, ca. 1140–50 (fig. 69), although this attribution has been questioned. Originally it may have contained fourteen introductory miniatures (only six survive), 24 historiated initials, and only nineteen decorative ones. Of the Pentateuch only Genesis and Numbers have frontispieces, both with unusual representations of scenes that emphasize the unity of Old and New Testaments and foretell Christ's redemptive sacrifice (Genesis frontispiece) and the promulgation of the Law (Numbers frontispiece). Miniatures for Ruth and Joshua (only that for Ruth survives) place an emphasis on Old Testament heroes and heroines. In addition there may have been an unprecedented concentration of frontispiece miniatures for Judges and the four books of Kings (1 and 2 Samuel, 3 and 4 Kings) that may well have emphasized the virtues of just kingship, though, since these illustrations are missing, this possible theme can only be conjectural. Also given considerable weight are the books of the prophets: the four major prophets, Isaiah, Jeremiah, Ezekiel, and Daniel were each introduced by a frontispiece (that for Jeremiah is now missing), while most of the remaining prophetic books are introduced by historiated initials. The book of Daniel, however, is given an especially strong decorative emphasis, with a frontispiece, four historiated initials, and one decorative one. These emphases may reflect the antipagan and antiheretical tenor of contemporary sermons and paraliturgical dramas, as well as the visionary and proclamatory iconography of Romanesque portals.

For some books the choice of iconography is fairly uniform—as in the representation of the Creation for Genesis or portraits of prophets for the minor prophets, but a surprising variety is evident in the choice of scenes for the other books. Thus, while stylistic and compositional sources for individual illustrations in these Bibles have been frequently discussed, the question of the relative weight and pictorial emphasis on some books and not on others, and of the selection of a particular iconographic program that might reflect the specific circumstances of a given monastery or patron, is still open to investigation.

Great Seal

Also known as the seal of majesty, royal seal, or *sigillum regis*, it bestowed authenticity to the documents to which it was attached. The use of seals had been common in antiquity, but the practice had died out in the early-medieval period. It is possible that royal letters in England were being authenticated by seals in the late 9th century, but the earliest surviving example is from the reign of Edward the Confessor (1042–66).

Though kings of Germany and France were using singlefaced seals attached to the face of documents in the 11th century, the seal of Edward the Confessor was double-faced and attached, pendent, to a tongue of parchment cut from the margin of the document. The precedents for a double-faced seal could have been the seals employed by the papacy or the Byzantine court.

The existence of the royal seal, together with the need to maintain its security and use it responsibly, led to the development of a royal secretariat. This occurred before the Norman Conquest, but the titles of the primary officer in the secretariat, the chancellor, and of his office, the chancery, may not have been used until after the Confessor’s reign. The royal secretariat was an aspect of the royal household; clerics formed its staff, since writing skills were essentially a monopoly of the clergy. When a description of the royal household, the *Constitutio domus regis*, was composed in the reign of Henry I (1100–35), it shows the chancellor as preeminent among household officers, responsible for the royal seal, supervisor of secretarial work, and head of the royal chapel. The chancellor and chancery remained within the royal

household through the 12th century and beyond, while the scope of secretarial work expanded as royal government extended its activities and as respect for authentic written records increased.

With the reign of King John (1199–1216) came a significant innovation in chancery procedure. The chancery either began to enroll copies of the three main types of documents issued under the great seal, or at least the survival of the copies began at this time. The copies were entered onto membranes of parchment sewn end to end and rolled up for storage.

The most formal sorts of documents, charters, were entered on the Charter Rolls; letters sent to individuals, folded up and closed by seal, were entered upon the Close Rolls; letters of a more public nature, issued open with the seal attached, were entered on the Patent Rolls. The survival of these records of central government, from the time of John onward, constitute a major source for historical research. Nor were these the only sets of records preserved in the early 13th century. For convenience the chancery clerks also found it helpful to make collections of outgoing documents along geographical lines, such as the Norman Rolls, Gascon Rolls, Welsh Rolls, Scotch Rolls, or French Rolls, or along topical lines, such as the letters close (i.e., letters closed by seal) sent to the royal exchequer directing that payments be made: the Liberate Rolls.

The enrollment of the three main series of chancery instruments, together with the numerous other types of rolls, meant that eventually chancery collected a rich and voluminous archive. Pressure built for the chancery to separate from the royal household and to establish a fixed location not only because of the difficulty of the staff and archive moving with the king but also for the convenience of those who wished recourse to its official instruments and who found it difficult to track down the king as he traveled.

In the first half of the 14th century the chancery came increasingly to be headquartered at Westminster. By this time there were other seals (particularly the privy seal) whereby the king communicated his wishes to chancery for issuing letters under the great seal; compared with these smaller seals, the royal seal could now be viewed as the great seal. Even with the chancery located at Westminster, instruments issued under the great seal continued to be the mechanism for implementing the majority of major administrative decisions, and the chancellor continued to be a principal administrative official whose political importance was enhanced by his prominent place on the king's council.

Greensted

First noted in 1789 by S. Lethieullier, Greensted, Essex, preserves the only surviving Anglo-Saxon wooden church (ca. 28.9 feet by 16.7 feet; built between mid-9th and early 11th century?). Hewett and Christie both mention that a modern guide to the church dates it to 845, reckoned from tree rings of the logs that compose the walls (no documentation given). A 13th-century history records St. Edmund's body resting near Ongar on the journey from London to Bury in 1013, but no contemporary records confirm this and the church is not specified. While carbon-14 dating would be desirable, the logs were impregnated with insecticide in the 1950s and again around 1965, and so contaminated.

Fig. 70. The Anglo-Saxon church at Greensted. After Lethieullier) drawing of 1748, published in Christie, Olsen, and Taylor (1979). Drawing by C. Karkov.

Only the nave of the wooden church survives (fig. 70), much mutilated by extensive rebuilding in 1848, when the walls were replaced on a new oak sill set atop a brick plinth. The walls consist of small, split oak logs without bark, set up so that the rounded side faces out. The logs are cut flat on the sides and grooved to accept tongues that fit the planks tightly together and weatherproof the wall. Each plank has a tenon fitting into the wall plate and sill and on the exterior an elliptical beveling cut from the top to the bottom to form a decorative variation. The exterior shows traces of tar, while the interior was at one time plastered and perhaps painted. Greensted has two unique construction aspects: a west gable wall of posts extending straight up to the roof with no tie-beam and unusual corner posts, of a single log from which a quadrant has been taken on the inside to form an angle.

In 1960 a limited excavation within the chancel yielded an early, narrower chamber with walls set directly into the ground without a sill, and a later chancel replacing it, with a wooden sill that “may therefore be assumed to have been of the same general type as the existing nave” (Christie et al., 110). The transition from post holes to timber sills was an important change in Scandinavian architecture, and Scandinavian examples (e.g., Hemse on Gotland) remain the closest analogues.

Gregory of Tours (ca. 538–594)

Frankish historian and bishop of Tours. Considered the "father of French history," Gregory was probably born in Auvergne, in the diocese of Clermont, to an ancient Gallo-Roman family. In 573 he was appointed by the Frankish king Sigibert I to the bishopric of Tours, where he remained to his death. His *Decern libri historiarum* (*Ten Books of History*), which has been erroneously known as the *Liber historia Francorum* (*History of the Franks*), is the only contemporary source for much of the history of Gaul in the 6th century. This work is regarded as a principal model for Bede's *Ecclesiastical History of the English People*, especially in its focus on one people only and its conclusion.

Like his English successor, Bede, Gregory used as the model for his own history ecclesiastical histories like that of Eusebius of Caesarea. There is evidence that he was influenced by Virgil and by Sallust's *Catiline*, as well as by the Christian writers Sulpicius Severus, Prudentius, Sidonius Apollinaris, and Fortunatus. As with other medieval histories Gregory's *History* relies on hearsay and legend for many of its historical facts. Gregory is concerned with religious orthodoxy, presenting a narrative of kings and saints instead of an historical record of events. His writing style is at times direct and realistic and

at times full of literary convention. The anecdotal style of Gregory's miracle stories influenced many later writers, and his methods of storytelling for historiographical and hagiographical genres helped to define the traditions themselves. His Latin is colloquial and difficult for the modern reader. Celtic and Germanic vocabulary additions are common, as well as the sometimes extremely erratic grammar usage.

Of additional relevance to OE studies is Gregory's mention of the death of the historical Hygelac (*History* 3.3), also noted in *Beowulf*

Grosseteste, Robert (ca. 1170–1253)

The great English scholar and bishop of Lincoln (1235–53). Born in Suffolk of humble parentage, he probably spent his early years as clerk in the episcopal households at Lincoln and Hereford. While his education in Oxford or Paris is a matter of conjecture, he was master of theology in Oxford by the early 1220s and was subsequently elected chancellor of the university. In 1229–30 he was the first Oxford lecturer to the newly arrived Franciscans.

As a scholar Grosseteste was among the early-13th-century theologians who

contributed to the development of the western scientific tradition. A scientific observer of causes and predictor of consequences, he urged the use of experiments in natural sciences. In his methodology he began with individual cases and worked to formulate general rules. His study of optics, for example, led him to ascribe to light a central role in the production and constitution of the physical world.

Grosseteste's works, written in Latin, French, and English, included scientific, philosophical, theological, and pastoral treatises. His theological works included the *Hexaemeron* (1230s) and numerous biblical commentaries and sermons. He wrote important commentaries on Aristotle's *Posterior Analytics and Physics* and translated the *Nicomachean Ethics* from Greek into Latin. His scientific interests were reflected in books on astronomy, comets, the tides, mathematics, and the rainbow.

As a bishop with a strong sense of pastoral responsibilities Grosseteste was an important figure in the reform movement in the 13th-century church; his devotional treatises were influential and widely read. While he supported the doctrine of papal plenitude of power, he clashed with the papacy over the growing practice of papal provisions (direct papal appointment of ecclesiastical personnel) and attacked corrupt papal politics at Rome in 1250.

Robert Grosseteste died on 9 October 1253. His books and notes were bequeathed to the Franciscan library at Oxford, ensuring his continuing scholarly influence on later generations of Oxford scholars.

Guilds and Fraternities

Medieval guilds and fraternities—the nomenclature is of little significance—were essentially voluntary associations of individuals for a social, religious, political, or economic purpose. None of these purposes was primary or common to all such associations; what was common was the sense of commitment, sometimes by a sworn oath, often by a financial contribution, to a shared objective. Some borrowed the language of the family, with members calling each other brother and sister; most had some kind of shared festivity.

The functions that by the later Middle Ages made religious fraternities and craft guilds appear as distinct kinds of organizations had evolved slowly, or had been added at particular moments, modifying the original form and purpose, but they still had many features in common. Guilds and fraternities for all purposes proliferated in towns, in whose populous and changing environment the need for association and mutual support was perhaps more keenly felt, though they were not confined to urban societies.

There was nothing essentially subversive in the idea of a guild, and in Anglo-Saxon England guilds were formed for peacekeeping purposes. Later merchant guilds in provincial towns and craft associations of London came to play a significant role in government and the ordering of society. But there was room for suspicion that such associations might, because of their sworn confederacy, offer opportunities or cover for seditious or heretical activities; hence the inquiry into guilds and fraternities in 1388–89.

Simple religious fraternities were formed, principally by lay persons, to ensure the performance of particular services or devotions. They might center on a parish church or, more rarely, a cathedral. Membership was usually circumscribed by locality. Often, especially in the later Middle Ages, when they are better recorded, they appear as communal chantries or burial clubs, securing for their members the essentials of Christian burial and prayers after death. Some raised subscriptions to support members in distress, but relatively few acquired significant real property and most seem to have had a modest scale of operations.

Associations of craftsmen and traders formed in many towns, not always distinguishable from religious fraternities, especially given the tendency for craftsmen to live near one another where locality helped to define membership. There is no need to assume that an association existed for every recorded occupation, nor that if there were an association of craftsmen of a particular kind they necessarily acted together for economic ends.

The pressures that drove craftsmen and traders to form guilds included neighborliness and the need for mutual moral support, and a religious fraternity lay at the heart of many such associations. But if a fraternity existed it could well become the instrument through which, at a subsequent date, economic or political ends were pursued. Economic pressures—the challenge of

interlopers, for example, or the need to secure supplies of raw materials from monopolist distributors—often brought fellow craftsmen together, and the social and religious aspects of association came later, strengthening their bonds.

The craft associations began to diverge from the voluntary origins of the guild when they obtained monopolies of manufacture or retail trade or control over access to citizenship. The development of formal apprenticeship systems also contributed. The control of a guild or craft association over a field of economic activity was never complete, and there was much jockeying for advantage. By the later Middle Ages most large towns had fairly complete systems of guilds to which citizens belonged and through which much economic and political activity was organized.

The London craft guilds, for a brief period (1376–84), were the constituencies from which the Common Council was elected. Later they sent representatives to the assembly that elected the mayor. In some provincial towns the crafts became instruments of control in the hands of town government, wherein lay the power to authorize and amend ordinances covering the practice of the craft. Craft guilds also, typically, made an important contribution to the cost and organization of civic display, whether in the form of plays and pageants, the Corpus Christi processions of many provincial cities, or of royal entries and mayoral shows, as in London.

Craft associations were most numerous and diverse in London, with over 1,200 in the early 15th century. Here they developed more complex constitutions, with the wardens or masters (common to most kinds of guild or fraternity) augmented by other officers. Some larger and wealthier associations had a two-tier membership, with liverymen and others, sometimes called bachelors or “the young men.” Forty-seven companies had a livery division in 1501–02; of the 784 men more than 600 came from the eleven leading companies whose interests were primarily mercantile.

The larger companies acquired, through donations and bequests, a considerable amount of real property, and with the rental income and members’ subscriptions they built halls for meetings and celebrations and maintained a lavish communal life. They devoted money to charitable and pious purposes, especially chantries and commemorations for deceased members. Some guilds obtained royal charters, confirming their holdings and their control of a particular activity, though these did not always prove a secure defense. The modest resources of the smaller companies of artisans kept their communal activities confined to a small scale, and they always remained more concerned with regulation of their specific craft.

Guthlac, Prose

An anonymous prose translation of Felix of Crowland's *Vita sancti Guthlaci* (*Life of St. Guthlac*; 740s), surviving in BL Cotton Vespasian D.xxi, fols. 18–40v. Five chapters of Felix's *Vita* (28–32) also survive as Homily 23 in the Vercelli Book.

Though not a homily in the usual sense of the term, the Vercelli Homily focuses the reader's interest on three closely related temptation scenes. The scenes build climactically from Guthlac's first temptation, when he is pierced with the arrows of despair, to his most famous temptation, when he is carried by evil spirits to the mouth of hell to see the pain and suffering of damnation. In each scene Guthlac demonstrates the superior power invested in his weapons, the Psalms. In the first and third temptations his patron saint, Bartholomew, arrives to strengthen him after he has vanquished his enemies. All three scenes illustrate Guthlac's ability to see the real weakness of evil spirits and their advice (in the second temptation, to fast excessively) as long as he remains loyal to God.

The prose *Guthlac* found in the Vespasian manuscript includes most of the details of the Latin *Vita* and therefore is considerably longer than the Vercelli

Homily (though shorter than the *Vita*). The Vespasian translator—or an earlier translator who provides the exemplar for the Vespasian text—is adept at converting Felix’s difficult Latin into readable Anglo-Saxon prose. Many short chapters in the Latin *Vita* are compressed into longer, unified sections. The Vespasian *Guthlac* includes some of the figurative language of the Latin *Vita* but reduces the quantity of it.

The Vespasian text, like the Vercelli Homily, emphasizes the saint’s ability to distinguish between the power of devils, which once recognized is really no power at all, and the power of God. Then, when sickness overtakes Guthlac in chapter 20, even though its symptoms are very like the torments of the evil spirits described earlier in the work, he immediately acknowledges God’s will that he should die. His acceptance of God’s will undermines the power of the evil spirits who had resided where Guthlac established his hermitage. Although the translator, following Felix, alludes frequently to other saints and holy men whose lives parallel Guthlac’s—St. Martin, St. Paul, St. Benedict of Nursia, Benedict Biscop, to name a few—there is remarkably little reference to Christ himself or to the Crucifixion or Resurrection. Indeed Guthlac’s weapons of the faith are most often Old Testament psalms. The major exception to this reticence is the emphasis in chapter 20 (as in Felix’s chapter 50) on the facts that Guthlac’s illness began the Wednesday before Easter, that he died on the Wednesday after Easter, and that his death, like Christ’s, was accompanied by an earthquake.

Guthlac A and *B*

OE poetic lives of the Mercian saint Guthlac (ca. 674–714), found in the Exeter Book. Despite the manuscript's large capitals and spacing at the beginnings of *Guthlac A* and *Guthlac B* early editors considered the beginning of *Guthlac A* to be part of *Christ III* and treated the remainder of *Guthlac A* and *B* as one continuous poem. In this century stylistic and metrical analyses have corroborated the paleographic evidence of two separate poems with different authors. Early scholarship and criticism of *Guthlac A* and *B* focused on possible authorship, sources, and literary parallels; since the 1960s *Guthlac A* and *Guthlac B* have attracted more attention as poems in their own right, though they remain relatively neglected.

Both poems are lives of saints and thus edifying and religious. *Guthlac A*, which draws on writings of the Church Fathers and oral tradition, emphasizes conflicts between good and evil personified in the encounters between Guthlac and various evil spirits. *Guthlac B* depends on Felix of Crowland's *Vita sancti Guthlaci* (740s) as a primary source but collapses the account of the saint's life into a few lines and focuses on the saint's death, the material presented in Felix's chapter 50. Both *Guthlac A* and *B* draw upon Anglo-Saxon secular poetic tradition (themes of exile, territorial disputes, the relationship between a thegn and his lord, and the ways of achieving heroic stature) in the expression of their Christian, didactic messages.

In *Guthlac A* the setting of the hermitage, emphasized in descriptive and symbolic passages (e.g., "the secret spot stood in God's mind"), and the saint's winning of a location that had been firmly in the hands of evil spirits both relate to the theme of Guthlac as God's warrior and contribute to a larger symbolic meaning. The action of *Guthlac A*—building the hermitage, turning back the verbal and physical onslaught of the evil spirits, and overcoming the temptations offered, especially when he is shown the moral laxity of monks of

his day and when he is physically carried to the mouth of hell—is intricately tied to the larger didactic purpose of illustrating that this world is a fallen place, vastly inferior to the salvation offered by Christianity.

Guthlac B emphasizes setting less and recounts little physical action; it is largely discourse between the saint and his servant Beccel after Guthlac has firmly established himself in his hermitage. After a prologue describing Adam and Eve's sin, which brought death into the world, the poem briefly recounts Guthlac's good deeds, which—empowered by God's grace—have allowed him to understand death as a release from suffering as well as a punishment for sins. The dialogue establishes an antithesis between Guthlac's spiritual maturity and understanding of the Christian view of death and Beccel's worldly sorrow at the prospect of his master's death. As the poem progresses, however, the questions the servant asks help the poem's audience understand the difficult lessons about death, especially that a Christian must die in order to have eternal life. Particularly attractive in *Guthlac B* are the figurative elements, many of which relate the themes of death and of life as exile. In a passage reminiscent of *Beowulf* death is personified as a thief who unlocks life's treasure and steals it away.

Guthlac A and *B* may not meet 20th-century standards of unity and coherence, perhaps partly because at least a folio of *Guthlac A* and the ending of *Guthlac B* are missing from the manuscript. Both poems, however, establish in their opening lines themes and images and proceed to develop them in ways that allow us to see the poems as part of larger traditions—both hagiographical and poetic—while at the same time making their own individual contributions.

H

Hagiography

Edifying literature that recounts the lives, deaths, or posthumous miracles of holy men and women; also known as saints' lives or saints' legends. Most hagiographical works bear little resemblance to sober, factual biographies—and logically so, since most hagiographers are preachers and publicists, not disinterested historians. Their central task is to glorify the memory of particular saints, generally for such practical purposes as strengthening the morale of the saint's community, driving home some point of doctrine or morality, winning new adherents to the saint's way of life, and drawing pilgrims to the saint's shrine.

Although similar stories have been told about the heroes of other religions, hagiography is associated above all with Catholic Christianity from late antiquity to the end of the Middle Ages. During this long period hagiographical works seem to have been popular in all sectors of Christian society, finding receptive audiences among the clergy and laity, upper classes and peasantry, learned and illiterate alike.

Definition and Interpretations

Despite its popularity and importance in medieval culture, hagiography has been treated as a marginal genre in modern times because it lacks many of the qualities that modern readers have learned to value. Even by medieval standards the legends represent an exceptionally conventionalized and conservative kind of literature. For more than a millennium, in fact, western European hagiography was shaped by the influence of a few key sources: the lives of Christ and Mary as found in a combination of canonical and apocryphal gospels; the biblical accounts of the persecuted faithful, from the early prophets to Stephen and Paul; and three seminal biographies of early Christian confessors, saints who did not undergo literal martyrdom—Athanasius's *Life of Anthony*, Sulpicius Severus's *Life of Martin of Tours*, and

the *Life of Benedict'm* Gregory the Great's *Dialogues*.

Vernacular retellings of legends were more open to variety and change than the Latin versions; but hagiographers in general seem to have taken for granted that the best way of proving the blessedness of new saints was to show how closely their experiences replicated those of their earliest and most eminent predecessors. Thus one finds the same conventions—and frequently even the same words—used in legend after legend. Like the seven Maccabean brothers in the Vulgate Bible (2 Maccabees 7) most martyrs in medieval legends eloquently defy their persecutors and endure incredible tortures before they die. Like the desert fathers of the early church most confessors (saints who are not martyred) in these legends renounce the world, withdraw into solitude to engage the Devil in single combat, miraculously provide for the physical needs of their followers, manifest the gift of prophecy by seeing things hidden from ordinary human sight, and make edifying speeches as they die.

The favorite motifs in medieval legends tend to portray the saints in exaggerated or idealized terms, not realistic ones. One can of course find legends that contain even more fantastic material than is typical of the genre—such as the hagiographic romance about St. George, who kills a dragon, rescues a princess, and survives every imaginable torture before he is martyred. But medieval hagiography in general asks the reader to accept two premises that are unrealistic by 20th-century standards: that the saints' experience is pervaded by manifestations of the supernatural—miracles, visions, encounters with the Devil, visits from angels—and that the saints' characters are fundamentally simple and fixed. Instead of giving us rounded, recognizable portraits of human beings who gradually grow into saints the majority of the legends suggest that from the moment of their conversion, or earlier still, the saints are distinguished from ordinary mortals by their heroic virtue, their apparent immunity to self-doubt, and the supernatural signs that surround them. In some of the favorite medieval legends there is not even a turning point, because the saint's holiness is manifest from infancy on; in others the saint affirms late in life that he or she has never even been seriously tempted to sin. This predilection for idealized, one-dimensional saints does not deprive the legends of dramatic conflict, since the saints' virtue can still be tested against devils, human persecutors, and other opponents; but it tends to reduce the conflicts to simple black-and-white terms and to heighten the apparent wickedness and perversity of the saints' opponents.

Given the gap between such conventions and their own expectations, modern scholars have not ordinarily devoted much serious attention to medieval hagiography. Even Hippolyte Delehaye, who was perhaps the world's preeminent authority on the old legends in the early 20th century,

regretfully dismissed the majority of them as a kind of childish folklore that had substituted itself for authentic, valuable historical documents. In the past few decades, however, students of medieval culture have begun to rediscover the potential usefulness and interest of this large body of literature. Applying narrative theory to early hagiography, for example, Alison G. Elliott treats the genre as a serious variety of folklore, or myth, analyzing the structural patterns that underlie it and the functions served by its conventions. Elliott develops an important distinction suggested in 1975 by Charles Altman: whereas the typical structure of a martyr's *passio* sets good in diametrical opposition to evil, the typical structure of a confessor's *vita* "presents a gradational view of the universe, in which *good* is opposed to *better* and *worse*' (Elliott, 1987: 17). To the former Altman and Elliott relate medieval epic; to the latter, romance.

Recent historical studies have begun to illuminate other facets of hagiography by studying legends in relation to their cultural and historical contexts. Peter Brown has explored the psychological and social needs that were met by the cult of the saints in late antiquity, in the process revealing unexpected depths of meaning in certain conventional features of the legends. André Vauchez and Richard Kieckhefer, among others, have done similarly far-reaching studies for the late Middle Ages, showing how the new spiritual movements and emphases of these centuries were reflected in the veneration of new kinds of saints. Caroline Bynum has focused on particular motifs, studying large samples of hagiography and other religious writings to determine the significance of such phenomena as the burgeoning of feminine images of sanctity in the 12th and 13th centuries and the prominent imagery of food and feeding in the lives and writings of late-medieval women saints. Focusing on the patterns of emphasis in a single hagio-graphical collection, the *Legenda aurea*, Sherry Reames has shown how the influential hagiographer Jacobus de Voragine reshaped existing legends in the 13th century, adapting the old stories to a new audience and new polemical purposes.

Although the studies just mentioned deal primarily with the Latin tradition, they are obviously relevant to understanding vernacular legends as well. For one thing they demonstrate that even Latin hagiography is less monolithic than it looks. Despite the continuing use of the same conventions, there are often significant differences between legends, or between successive retellings of the same legend, which a knowledgeable reader can recognize. Such comparisons readily offer themselves in English vernacular hagiography, since nearly all the legends in both OE and ME are directly dependent on Latin sources.

OE Saints' Lives

An impressive amount of hagiographical literature in the vernacular has survived from Anglo-Saxon England. The earliest saints' legends in England were written in Latin by the mid-8th century, and vernacular legends began appearing by the 9th. The bulk of surviving OE hagiography is in prose, due largely to the enormous contribution of Ælfric, who wrote in the late 10th to early 11th century. Ælfric's two homiletic collections, extensively copied, include more than twenty saints' lives, ranging from New Testament figures like Stephen to the English Cuthbert. Ælfric also wrote a third collection, the *Lives of Saints*, containing some 26 saints' lives as well as other materials. These *Lives* were intended for the private reading of monks and included saints especially honored in monastic circles. Also in prose are earlier works like the Mercian 9th-century *Life of St. Chad*, a translation of Felix's *Life of St. Guthlac*, and the OE Martyrology, again from Mercia, which gives short narratives about the saints in the order of the liturgical calendar, including about twenty English saints. Additional vernacular prose hagiography occurs in the translations of Bede's *Ecclesiastical History* and Gregory's *Dialogues* that were produced by Alfred's circle of scholars and in anonymous collections like the Blickling Homilies and the Vercelli Book, which together include some half-dozen saints' lives among their homilies.

Early hagiographical poetry in OE appears to date from approximately the same time and place as the earliest prose—9th-century Mercia—suggesting that Mercia was an early center of interest in the vernacular production of saints' legends. There are five or six extant poetic legends and several other poems that exhibit the influence of this tradition. Two of the poems, *Juliana* and *The Fates of the Apostles*, were written by Cynewulf, whose name we know due to his habit of ending his poems with riddling passages containing his signature in runes. *Juliana* deals with the Byzantine virgin who died during the Diocletian persecution, and *The Fates* is a shorter poem outlining the martyrdoms of the twelve apostles. The other saints' lives in poetry are *Andreas*, an extended narrative of the apostle Andrew's conversion of the cannibalistic Mermedonians, and *Guthlac A* and *B*, two poems about the Mercian saint of that name (d. 714). The poems *Judith* and *Elene* (the latter also composed by Cynewulf and sometimes called a saints' life) are not saints' lives in the strictest sense; however, both show the influence of hagiography in their characterizations.

In contrast to the bulk of OE prose hagiography OE hagiographical poetry often transforms its Latin sources radically (in the case of *Guthlac B*, differences are so thoroughgoing that its dependence on a Latin source is

questionable). One important feature of the transformation, seen especially in the Cynewulf poems, *Andreas*, and *Guthlac A*, is the “heroicizing” of the narrative. Thanks in large part to the influence of the traditional poetic diction these legends are transformed into fit traditional subjects of OE poetry. Martyrs become warriors of God, such hagiographical conventions as spiritual combat with the Devil are expressed in terms of martial strength, companions become the Germanic *comitatus*, or warrior band, and so on. Admittedly, there are other influences that facilitate this process—for example, the martial imagery in the Pauline epistles. But we can assume that the strongest influence is the oral traditional style because such heroicizing occurs only rarely in OE prose; in fact it is confined almost entirely to Ælfric’s *Lives of Saints*, which use a rhythmical prose style with some similarities to OE poetry. The employment of traditional poetic diction and concepts in hagiography was not simply mechanical and could, for example, create subtle rhetorical effects through the ironic use of those conventions.

Two other characteristics clearly distinguish the OE poetic legends from the Latin versions behind them. The use of typology and iconography typical of medieval hagiography is especially prominent in these poems. For example, *Andreas* frequently makes use of exaggerated plot devices and patterns of imagery in order to emphasize the iconography of baptism and eucharist. Thus the Mermedonians are punished for their sinfulness by both a great flood and a huge conflagration, and the shoulder-high waters issue from a single rock. Secondly, although OE prose legends generally deal with the entire narrative as found in their Latin sources, several of the poems—for instance, *Andreas* and *Guthlac A* and *B*—concentrate on a limited number of events from the life of the saint. *Juliana* and *The Fates of the Apostles* also pass over early parts of the saints’ lives, but this is more typical of the subgenres to which they belong—the *passio* and the martyrology, respectively.

ME Saints’ Lives

For a time after the Norman Conquest most vernacular hagiography written in England was in French. But Ælfric’s accounts of the saints continued to be copied until the second half of the 12th century, showing that there was a continuing audience for English-language hagiography. From the late 13th century on striking proof of the genre’s popularity is provided by the textual history of two monumental ME collections. The earlier of these, the *South English Legendary*, consists of versified legends and other material for church festivals and was apparently written for oral delivery to unlettered members of

the laity. The wide circulation of the *Legendary* is attested by its survival in more than 60 manuscripts (counting fragments), ranging in date from about 1300 to 1500, and by the diversity of those manuscripts in both dialect and contents. The fullest ones contain over 90 saints' legends. The other great monument of ME hagiography is Caxton's *Golden Legend*, a massive prose compilation that contains some 250 legends, most of them adapted from Jean de Vignay's French translation of the *Legenda aurea*. Caxton's version, evidently designed for private reading by prosperous and well-educated laypeople, was a bestseller from its first publication in 1483 until well into the 1520s.

As these first two examples suggest, it is difficult to generalize about ME hagiography, because it was written for diverse audiences and includes a wide range of literary forms, purposes, and levels of sophistication. At one extreme are unvarnished popularizations that emphasize colorful, dramatic storytelling, sacrificing the layers of symbolic meaning in the Latin versions for an engaging narrative and some simple lessons about faith and conduct. Works in this category include a number of individual saints' legends retold in the style of popular verse romances, which were sometimes copied into the same manuscript anthologies with those romances, and most chapters of the *South English Legendary*.

At the opposite extreme one finds some ME legends composed for an elite readership and displaying considerable literary ambition. The most obvious examples come from the 15th century: Bokenham's *Legends of Holy Women*, comprising thirteen lives of female saints, written in a variety of metrical forms and dedicated to various patrons; Capgrave's courtly-epic version of the life of Katherine of Alexandria and his lives of Augustine, Gilbert, and Norbert; and Lydgate's nine hagiographical poems, most of which are still more elaborate and rhetorical. Also quite ambitious, though in a different way, are the three early ME legends in the Katherine Group (ca. 1190–1220)—skillfully elaborated accounts in vivid alliterative prose of the virgin martyrs Juliana, Margaret, and Katherine. And even the greatest of the late-14th-century poets sometimes turned their hands to hagiography. Chaucer translated at least one genuine saint's legend, the account of St. Cecilia assigned to the Second Nun in the *Canterbury Tales*, and expertly imitated the genre on a number of other occasions—most obviously in the *Prioress's Tale*, *Man of Law's Tale*, *Clerk's Tale*, and *Legend of Good Women*. Gower retold one famous legend, Pope Sylvester's conversion of Constantine, in the *Confessio Amantis*. A contemporary master of the alliterative tradition, thought by some to be the same poet who wrote *Sir Gawain* and *Pearl*, produced the anonymous poem *St. Erkenwald*.

Most typical of the period, however, are utilitarian-looking collections of

ME legends. There are, for example, two manuscripts of the *Northern Homily Cycle*, both copied around 1400, that add to the cycle's usual contents a series of some 30 legends written in short couplets. The exact sources of these legends have yet to be identified. The other collections in this category all depend to a large extent on Jacobus de Voragine's *Legenda aurea*, but no two of them are alike. John Mirk's *Festial* (ca. 1400), a prose compilation that remained popular enough to warrant nearly twenty early printed editions, includes some 30 brief accounts of saints among its homilies and narratives for church festivals; Mirk's book was evidently designed to help parish priests prepare their sermons. Roughly contemporary with Mirk are two verse translations of parts of the *Legenda aurea*, each surviving in just one manuscript: the *Scottish Legendary*, which consists of a prologue and 50 legends selected and rearranged by the translator, who calls himself a retired "mynistere of haly kirke," and the so-called Vernon *Golden Legend*, a selection of nine legends, including some unusually long and interesting ones, found in a famous manuscript probably owned originally by a community of nuns or monks. Finally, nearly half a century before Caxton's full-scale adaptation of the *Legenda aurea*, an anonymous English translator produced a prose version, usually called the *1438 Golden Legend* or *Gilte Legende*, that contains up to 178 legends and survives in at least seven reasonably complete manuscripts and some fragments. Most of this collection has still not been published, and one can only speculate about the particular readership and purposes for which it was written.

Much remains to be learned about the huge corpus of ME legends, but recent developments in scholarship have given a new impetus to the study of such works, both as examples of popular literature and as documents in cultural and religious history. One important development is the discovery that hagiography—and especially vernacular hagiography, with its diversity of intended audiences—provides a wealth of evidence on issues of gender, class, language, and ideology in medieval culture (well illustrated by the essays recently edited by Blumenfeld-Kosinski and Szell). Even more important is the development of interdisciplinary methodologies that can do justice to the richness and complexity of the evidence; some of the best examples to date are found in Ashley and Sheingorn's collection of articles on the symbolic functions of St. Anne.

Hanseatic League

The league began with the founding at Liibeck in the mid-12th century of a loose association of about 180 German towns to protect their commercial interests. Within a century German merchants dominated Baltic and North Sea trade, and in the 14th century they expanded their investment into France, Portugal, Spain, and southern Italy. The Hanse made loans to English kings, and when the privileges granted in exchange for customs duties by the 1303 *Carta mercatoria* were withdrawn from other aliens by Edward II, the Hanse retained theirs and received further advantages in 1347 from Edward III.

The internal organization was intended to maintain control over Hanse merchants in every country. However, political differences persisted between the northern Prussians and the southern Wendish towns, despite united diplomacy. Four main communities, in London, Bruges, Bergen, and Novgorod, were subordinate to the Hanse Diet and were responsible for secondary settlements. Thus the London Steelyard, an autonomous enclave established by 1320, controlled Hanse merchants in Newcastle, York, Hull, Boston, Lynn, Yarmouth, and Ipswich. They made up the largest group of alien merchants; their imports and exports of cloth fluctuated, running between 7 and 24 percent of England's trade.

There was an inherent imbalance in Hanseatic trade. Although Flemish, Dutch, and English cloth comprised their major import, plus ale and beer, and later salt, these did not balance the valuable raw materials the Hanse exported west: Norwegian fish, Swedish and Hungarian minerals, Russian furs and wax, Prussian grain and timber, Rhenish wine from Cologne. Hostile relations with most of its European trading partners from the 1350s transformed the Hanse into a major political power, now based in only 55 to 80 towns.

Attempts by English merchants to penetrate the Baltic in the 1360s and 1370s were frustrated by the Hanse refusal to reciprocate trading privileges and led to major conflict with England. Until the Peace of 1474 embargoes, piracy, and open war were particularly damaging for the east-coast ports, notably Boston, where Hanse cloth exports had been concentrated. The league survived until 1630, though signs of contraction were apparent a century earlier.

Hardham Wall Paintings

One of the most complete cycles of English Romanesque wall paintings survives in St. Botolphs Church, Hardham, West Sussex. Dated to the early 12th century, the cycle consists of approximately 40 scenes arranged in two tiers in both the nave and chancel of the church. The painting is done in true fresco technique (on wet plaster) with details added in secco (on dry plaster).

The iconographic program begins and ends on the west wall of the nave with the Last Judgment. The walls of the nave are painted with scenes from the Infancy of Christ (Annunciation to Baptism) and from the life of the warrior St. George and two of the twelve labors of the months. The Adoration of the Lamb is placed centrally over the west wall of the chancel arch. The east side of the chancel arch displays the Temptation of Adam and Eve and their labors. The Temptation is painted as an imitation tapestry hung from a rod, the only one of the Hardham scenes to be painted in this fashion. The north and south walls of the chancel show figures of the apostles and elders of the Apocalypse above scenes of Christ's Passion, the latter having an obvious liturgical significance. The program originally culminated in a monumental Christ in Majesty flanked by cherubim and seraphim on the east wall of the chancel. Together the scenes framed the celebration of the mass with images of judgment, sacrifice, and the body of Christ, serving as a warning for the congregation, as well as a visual manifestation of the body and blood of Christ

before them. The scenes of St. George might have summoned up visions of the First Crusade, while his dragon was paralleled by the dragon from whom Eve takes the apple in the Hardham Temptation, signifying that danger and spiritual battle threatened both at home and abroad.

The Hardham paintings are finely executed, with elongated figures, expressive gestures, and bright colors. The iconography has some unusual features: the dragon tapestry and dragon format of the Temptation, Eve shown milking a cow, instead of spinning, as her labor. The source of the paintings is problematic. A number of scholars have felt that, while Romanesque in date, the paintings are a continuation of the Anglo-Saxon tradition, linking them specifically with such late Anglo-Saxon manuscripts as the “Cædmon” Genesis (Bodl. Junius 11), as well as with the decoration of 12th-century Danish churches at Orreslev, Fjenneslev, and Jorlunde. Audrey Baker identifies a Cluniac influence filtered through Lewes Priory, David Park sees a clear Ottoman influence, while C.R. Dodwell believes the paintings to be fully Norman in style, with parallels in manuscripts produced at Jumièges and St. Ouen. Given the increasingly international nature of society in the 12th century, we should not be surprised that an artist working in Anglo-Norman England might combine elements of Anglo-Saxon, Norman, and Ottoman styles in the creation of a highly original composition.

The Hardham paintings have also been linked both stylistically and iconographically with paintings in four other nearby churches: Clayton, Plumpton, Coombes, and West-meston. The group as a whole has been labeled the “Lewes Group,” as the paintings in all five churches are thought to be derived from (or sponsored by) Lewes Priory. While there are certainly comparisons to be made among the cycles, the validity of the label has been called into question. Each cycle is unique in its own way, none contains the unusual elements found at Hardham, and, perhaps most important, only fragments of wall paintings are known from Lewes Priory.

Hardyng, John (1378-ca. 1465)

Author of a chronicle of Britain and England from their settlement to the mid-15th century; after military service at Agin-court and in the Scottish marches he was appointed constable of Warkworth Castle in Yorkshire and later Kyme Castle in Lincolnshire. His *Chronicle* is found in two versions. The first, extant in one manuscript, was presented to Henry VI in 1457. The shorter revised version was presented to Edward IV in 1464; it survives in twelve manuscripts and four fragments. The *Chronicle*, which was known to Malory and Spenser, incorporates material on the Grail story and is of historical value for the reign of Henry VI. It is also interesting for its political agendas concerning English rule of Scotland and the Lancastrian and Yorkist claims to the English throne.

Harley Lyrics

The ME lyrics found in BL Harley 2253, a compilation made partly in the late 13th century and partly in the 1330s. The earlier portion of the manuscript contains religious narratives in Anglo-Norman; the later portion (fols. 49–140) is a collection of religious and secular works, in prose and verse, written in Latin, Anglo-Norman, or English, including saints' lives, fabliaux, proverbs, debate poems, dream lore, *King Horn*, and a travel guide to Jerusalem. Harley 2253 is famous, however, for its preservation (between fols. 55 and 128) of 49 short poems in English, among which are nine historical-satirical poems, nineteen religious and sixteen secular lyrics, and five miscellaneous pieces. Of these poems 31 are unique to this manuscript, which is our most important witness for the history of the early, and especially the secular, English lyric.

The manuscript was made in the west Midlands near the borders of Herefordshire, Shropshire, and Wales; its later part was copied by a scribe working in or near Ludlow, Shropshire, whose hand is found in other literary and documentary manuscripts of the early 14th century. Some of its poems were composed locally, as indicated by references to place-names—Ribblesdale, the River Wye, and Wirral—and by their metrical and stylistic affinities with Welsh poetry. It contains other materials that are clearly of local interest. Some lyrics, however, are evidently by poets who lived elsewhere—"bituene Lyncolne ant Lyndeseye, Norhamptoun and Lounde"; philological data show that various lyrics were composed in various dialects, and a few appear in manuscripts produced in other parts of England.

The lyrics are usually dated as late-13th- or early-14th-century. More precisely datable are the political poems, which presumably were composed fairly soon after the events they describe: the battles of Lewes (1264), Courtrai (1302), and possibly Bannockburn (1314); the execution of Sir Simon Fraser (1306); and the death of Edward I (1307). Less certain are the dates of the *Complaint of the Husbandman* (ca. 1300?) and the satires against fashion, the consistory courts, and the retinues of noble households. It is noteworthy that the historical and satirical poems, though strident in tone, show a sophistication in meter and in style that compares well with the more polished performances of the lyrics.

Harley 2253 contains many fine religious lyrics, notably "Erthe toe of erthe," but its chief glory is its unprecedented collection of secular lyrics. The artistry

of these indicates that they must have had forebears in English—though none survives. There are analogues of sorts in the Anglo-Norman tradition, which blends French modes of poetry with native English traditions. Striking in the Harley lyrics is the tendency to combine features of different genres or styles to create unusual effects—courtly matter and popular refrain, love allegory and lyric lament, pastourelle and formal description, amorous praise and ribald suggestion, personal reference in what is ordinarily an impersonal mode of writing. Because so few early ME lyrics survive, one cannot know how representative the Harley poems are, but as literary documents they are extraordinary.

Harley 978

A well-known manuscript from Reading Abbey (BL Harley 978), compiled sometime in the period 1245–65, probably at the behest of a single individual. Its contents are eclectic and reflective of wide intellectual interests and sources, suggesting a university connection. Famous principally because it contains the canon “Sumer is icumen in,” Harley 978 also possesses the unique text of the “Song of Lewes” (*Calamo velociter j*, the best English collection of goliardic verse, the largest surviving collection of the fables and lais of Marie de France, an index to the extensive contents of an otherwise lost book of polyphony, and other items. In addition to the Sumer canon the musical contents of the manuscripts first large section include ten lengthy monophonic Latin songs of the sequence or lai type, one three-voice motet, three two-voice textless (instrumental?) pieces, and two pages of elementary music-instruction material.

Harley Psalter and the “Utrecht” Style

Fig. 71. Harley Psalter (BL Harley 603), fol. 1. Psalms 1 and 2. Reproduced by permission of the British Library, London.

BL Harley 603 is the first of three English medieval copies of the Carolingian masterpiece of illusionistic drawing, the Utrecht Psalter (Utrecht, Rijksuniversiteit 32). Each psalm in the Carolingian book is headed by a sepia drawing with literal illustrations of psalm verses set into rolling landscapes reminiscent of antique art. The Harley Psalter (fig. 71), produced at Canterbury during the first half of the 11th century, was conceived as a copy of this manuscript, though the Roman Psalter text was substituted for the Carolingian manuscript's Gallican text and a more legible minuscule for the rustic capitals of the original. Only 111 drawings were ever completed, twelve of them in the 12th century. The precise chronology of the extended production process remains unclear, and as many as six different artists worked on the Anglo-Saxon phases of the decoration. Specific circumstances of patronage and function are also uncertain. The archbishop depicted at the feet of Christ in the

historiated *Beatus* initial may well have commissioned the psalter, perhaps for King Cnut (1016–35) or Emma, his queen.

Harley 603 is famous for faithful copies of the Carolingian imagery, rendered in the nonnaturalistic and often kaleidoscopic colored line much favored by late Anglo-Saxon artists. Less well known are the pictures that adapt and transform the Utrecht scenes, often in response to contemporary political and religious considerations, some diverging completely from the imagery of the Utrecht Psalter. In addition to the innovative psalm illustrations and the *Beatus* initial a unique painted miniature of the Trinity was added to preface the book.

Both the style and the imagery of the Utrecht Psalter exerted continuing influence on medieval English art. The early pictures of the Harley Psalter exemplify the expressive and dynamic Anglo-Saxon drawing technique labeled by Wormald the “Utrecht” style (1952). Figures are executed with short, sharp strokes; heads push forward and draperies flutter. Wormald considered the art of Reims a major contributing factor in the development of this stylistic phase, which peaked in the early 11th century but was evident well before the millennium. As Deshman has emphasized (1977), the native insular predilection for flickering line and nervous dynamism, seen already in the Leofric Missal (Bodleian Library, Bodley 579) and the *Æthelwold Benedictional* (BL Add. 49969; [fig. 26](#): see *Benedictional of Æthelwold*), must have predisposed English artists to their avid response to the Utrecht manuscript. The Crucifixion of the Ramsey Psalter (BL Harley 2904) and an Aratus manuscript of the late 10th century (BL Harley 2506) are fine examples of developed “Utrecht” style, which is further evident in early-11th-century drawings of the New Minster Liber Vitae (BL Stowe 944). Artists of the *Ælfwine Prayerbook* (BL Cotton Titus D.xxvi and D.xxvii), working in the same style, were among the many Anglo-Saxons who also adapted some of the Carolingian psalter’s iconographic formulas.

Harold Godwinson (ca. 1020–1066)

On 14 October 1066 Harold Godwinson, the last Saxon king of England, lay dead on the field of Battle, near Hastings in Kent. The hopes of his family to create a royal dynasty were dashed, the fortunes and lives of his supporters wasted in what may have been as audacious a bid for royal power as that of William the Conqueror.

Harold had been opposed by several contenders for the throne after the death of Edward the Confessor in January 1066 and had defeated them all, including his brother Tostig and Tostig's ally, King Harald of Norway, at the Battle of Stamford Bridge in late September 1066. The decision to undertake a forced march from Stamford, near York, to Hastings, where William waited with his continental army, is often seen as a move made in desperation; it is likely that Harold was confident of victory or, at the very least, of a temporary repulse of William.

William's success has dominated the history of late Anglo-Saxon times. It is often forgotten that Harold, formerly earl of Wessex, had been king for nearly a year. The short duration of his reign means that little was written about it, or about Harold's character, by the historians of the day. William of Poitiers, who wrote his *Gesta Guillelmi ducis Normannorum et regis Anglorum* in the 1070s, describes Harold as brave, ambitious, and clever, but an unwise dispenser of patronage. The English author of the *Vita Aedwardi regis* is more enthusiastic; Harold "was a true friend of his race and country, he wielded his father's

powers even more actively, and walked in his ways, that is, in patience and mercy, and with kindness to men of good will.” It is not entirely surprising that legends of Harold’s survival after Hastings circulated for some years after the battle.

Harold was 27 when he inherited the earldom of Wessex on Godwins death in 1053. Harold and his brothers Leofwine, Gyrth, and Tostig controlled, as earls, all of southern England, including East Anglia and even a part of Northumbria. Harold and Tostig were successful in England’s defense against Welsh and Scottish forces, and both won Edward’s gratitude. But it was to Harold that the dying king commended his wife (Harold’s sister Edith) and kingdom in January 1066.

Harold had held a special position at court, referred to as Edward’s governor by the *Vita Aedwardi regis*, and in 1064 or 1065 royal ambassador to Normandy. This visit, at which Harold presumably promised to support William’s claim to the English throne, is recorded mainly in pro-Norman sources; the story is difficult to reconcile with the silence of Anglo-Saxon writers on the subject. The *Vita Aedwardi* hints of the visit, but the Anglo-Saxon Chronicle does not refer to it. Harold clearly believed, at Stamford Bridge and Hastings, that he was defending England from its enemies, not that he was asserting a doubtful claim.

It is possible that the Confessor may have fed the hopes of several contenders with hints of a future bequest. Such a ploy would have been useful in preventing invasions from Scandinavia and France during his lifetime. As a prominent royal adviser, Harold may have been cognizant of the double dealing and thus unlikely to take seriously foreign claims to the throne.

It is impossible to know what kind of king Harold would have made or what tone he would have established had he repelled the Normans. The combination of lands inherited from Edward and his own earldom made him extraordinarily powerful, and the successful exploitation of these resources gave him the means to finance important projects. His founding of a college of canons at Waltham suggests that patronage of religious houses would have been one aspect of his policies. His efforts to extend English influence in Wales would no doubt have continued after 1066, and he might have built his own retinue of loyal, powerful nobles.

Harrowing of Hell

The “plundering” or “harrying” (ME *henen*, “to pillage, plunder”) of hell by Christ, after his death, of the souls of the righteous held by Satan. The principal source for the medieval legend is the Latin account of Christs descent into hell appended to a translation of the Greek *Acta Pilati* (dated variously from 425 to 600) to form the text known as the *Gospel of Nicodemus*. Extracts from the *Gospel’s* account of the harrowing are found in encyclopedic texts, such as the *Legenda aurea* of Jacobus de Voragine and the *Speculum historiale* of Vincent de Beauvais, as well as the Pseudo-Augustinian Homily 160, *De Pascha* (“On Easter”).

The *Gospel of Nicodemus* consists of three main episodes: the trial of Christ before Pilate and the Crucifixion; the imprisonment of Joseph of Arimathea by the Jews and his miraculous release on Holy Saturday by Christ; and the eyewitness account of the harrowing given by the two sons of Simeon after Christ’s resurrection. The harrowing appears in ME in a variety of forms and genres. There are works in both verse and prose that closely follow the whole *Gospel*. In other works a translation of the *Gospels* harrowing is linked to an episode from another source, as in the verse *Harrowing of Hell and Destruction of Jerusalem* and the prose *Complaint of Our Lady and Gospel of Nicodemus*. Treatments more independent of the *Gospel of Nicodemus* are found in dramatic and quasi-dramatic forms that exploit the potential of the physical and verbal conflict between Christ and the devils: for example, the Harrowing

of Hell cycle plays, the *Devils' Parliament* (a verse sermon), *Piers Plowman* B.18/C.20, and *Death and Life*.

The harrowing is used for three major themes in ME literature. First, the imprisonment and release of Joseph of Arimathea and the account of Christ's descent by the sons of Simeon, Karinus and Leucius, are testimony of the Resurrection. Second, the legend is typological in that it is designed to show the fulfillment of prophecies. The account of the harrowing in the *Gospel of Nicodemus* dramatizes this through speeches of Christ and the prophets in hell, and ME texts, principally the drama, tend to amplify this part of the episode. A third theme is the Redemption, a topic that involves a number of related issues, all with their roots in the *Gospel*. Most obviously the harrowing shows Christ's defeat of the Devil. The *Ludus Coventriae* (N-Town plays) and the *Devils' Parliament* develop the idea of the deception of the devils, who realize only at the harrowing that Christ is not just man but divine. In the York and Towneley plays, the ME *Harrowing of Hell*, the *Devils' Parliament*, and *Piers Plowman* the harrowing becomes the forum for a debate between Christ and the devils on the justice of freeing the souls in hell. The treatment of the harrowing in ME thus becomes a mirror of changing doctrine on the Redemption.

Harry (or Hary), “Blind” (fl. ca. 1476–78)

The author of *The Wallace*, a vehemently anti-English, often fictitious account of the Scottish hero William Wallace’s struggle against the English between 1293 and 1306. The first Scottish work to employ the pentameter couplet, *The Wallace* survives in a single manuscript (National Library of Scotland Advocates’ 19.2.2), copied in 1488, which also contains a text of Barbour’s *Bruce*. Harry’s poem was first printed ca. 1509, though only fragments of that edition remain. *The Wallace* is indebted to a multitude of chronicle, romance, and courtly writers; it was one of the earliest (and later most popular) works printed in Scotland. The poet’s traditional epithet “blind” can be traced back to the 1490s; however, Harry’s vivid and accurate use of visual detail has led most modern scholars to believe that he was in fact not blind from birth.

Hawes, Stephen (ca. 1470–ca. 1529)

Early Tudor humanist and courtier, best known today for his long allegorical poem *The Pastime of Pleasure* (1505/06; pub. 1509). Chronicling the education and adventures of its hero, Graund Amour, the *Pastime* bridges the worlds of medieval visionary allegory and early Renaissance courtier poetics. Throughout the *Pastime*, as well as in other works (*The Example of Virtue*, *Conversion of Swearers*, *A Joyful Meditation*, and *The Comfort of Lovers*), Hawes develops his theories of poetry as a form of prophecy and his attitudes toward aureate (that is, highly latinate) diction as a way of purifying the language of vernacular verse.

Most modern readers know Hawes as a follower of Lydgate and Chaucer, as a source for Spenser's courtly allegories, and as a witness to the practices of early humanist rhetoric. His poetry has long been considered an example of what C.S. Lewis called the "Drab Age" of English letters. But Hawes is now receiving new attention from scholars of the history of printing, court culture, and the complex shift: from "Medieval" to "Renaissance" in poetry and criticism. One of England's first poets to write exclusively for print, Hawes often reflects on the power of books to confer literary fame, and he develops metaphors of impression and understanding drawn from the technologies of movable type.

Hawking and Falconry

The two forms of hunting with different kinds of raptorial birds. Falcons have pointed wings and long narrow tails; they typically hunt by diving (“stooping”) at their prey at high speed from a considerable height, killing on impact, and so are best suited for open country. Hawks have shorter, rounded wings and wider tails for greater maneuverability; they can be flown in brush or wooded areas. They fly down their prey with a burst of speed and kill with their talons.

Among both falcons and hawks the female is generally larger and stronger than the male and is therefore used more in hunting, since she can bring down larger and more active prey. Hawks (the generic term) used in medieval falconry (the word included the flying of hawks) were the gerfalcon, peregrine, lanner, merlin, goshawk, sparrowhawk, and (more rarely) the saker and hobby. Although hawks and falcons were flown at a variety of prey, crane, heron, and duck were the most prized.

The training of hawks was time-consuming. The birds had to become accustomed to handling and were trained to return to an aural or visual cue. Falcons were taught to fly to a lure, hawks to return to the fist. Falcons selected to hunt crane or heron (large birds that falcons do not naturally attack) had to be taught to hunt those birds. Once a hawk had been trained, she had to be flown regularly to keep her in condition.

To practice falconry, then, meant having leisure to devote to one’s birds or money to hire someone to do so. The most prized birds were expensive, costing up to half a knight’s yearly income. Falconry was thus from an early date associated with the upper levels of society. Not only was it extremely popular, but owning and flying hawks was a status symbol and handling them part of an upper-class education, for women as well as for men.

In England the recorded history of falconry begins with St. Boniface, who in the 8th century noted in a letter to Æthelbald of Mercia that he had sent a hawk and two falcons. From then on a growing number of references to falconry appears in royal records, literature, and art. By the late 10th century well-to-do laypeople and some clergy practiced hawking, and from the mid-11th century on all the kings are recorded as flying hawks.

Domesday Book names hawkers for Edward the Confessor and William I. Both Henry II and Thomas Becket were skilled falconers, and Richard I had

falcons sent to him while he was in captivity. Perhaps the greatest English royal falconer was Edward I, who built a splendid royal mews at Charing Cross, spent close to £900 on falconry in one year, and in some years paid more than 100 men for service connected with the sport.

Henry I (1067/68–1135; r. 1100–35)

Youngest son of William the Conqueror and Matilda of Flanders, he was left rich but landless on William's death in 1087. He used part of his inheritance to purchase the Cotentin and Avranchin from his eldest brother, the perpetually penniless Robert Curthose, duke of Normandy. In 1091 he lost these provinces to the combined military forces of his brothers Robert and William Rufus, king of England, but he later came to terms with Rufus. In 1096 Robert pawned Normandy to William and set off upon crusade. As Robert was returning in 1100, William was killed in a hunting accident and Henry seized the throne. Because of the timing of the death Henry has been suspected of being in a murder plot, but the evidence supports the view that Rufus was accidentally shot.

Upon his accession Henry issued a coronation charter, denouncing the abuses of his brother's reign and agreeing to rule England by the laws of Edward the Confessor. He set about filling some of the vacant bishoprics and recalled Anselm, archbishop of Canterbury, from continental exile. He then married the Scottish princess Matilda, who carried the blood of the line of Alfred the Great. The marriage produced two children, Matilda (b. 1102) and William (b. 1103). Matilda was betrothed to the German emperor Henry V and

left England in 1110.

The first years of Henry's reign were spent consolidating his rule and fighting against Robert Curthose, who invaded in 1101 to claim the throne. In the Treaty of Alton Robert renounced his claim to the throne in return for an annual pension. However, he continued to be troublesome, and because he could not keep peace in the duchy of Normandy Henry was asked to intervene. In July 1106 Henry launched an invasion that culminated in the pitched battle at Tinchebrai on 28 September. Robert was captured and remained in captivity until he died in 1134. Even then Henry could not be secure in his possession of Normandy, because Robert's son, William Clito, also had a claim to the duchy, and Henry had to put down several revolts.

A major challenge to Henry came in 1111, when Louis VI of France joined with the counts of Anjou and Flanders. Henry emerged the victor by negotiating a separate peace with the count of Anjou; Louis was forced to recognize English overlordship in Maine and Brittany. Hostilities resumed in 1116, when some Norman barons joined a rebellion in favor of Clito. When the count of Flanders was killed in 1118, Henry again used his diplomatic skills, marrying his son William to the daughter of the Angevin count. At this point Louis complained to the pope about Henry's action, but Calixtus II remained friendly to both sides and Normandy was at peace by 1120.

Tragedy struck in 1120, with the death of Henry's only legitimate son, William, drowned when his ship struck a rock in the Channel. With this death the succession was thrown into doubt. Henry's queen had died in 1118, and after William's death Henry quickly married Adeliza (or Alice) of Louvain in 1121. But as time passed, it became clear that they were not going to produce children, and Henry was forced to make plans for a successor.

The years 1123–24 were marked by Norman insurrection. When Henry V of Germany died in 1125, Henry recalled his daughter and began to concentrate on making her a viable candidate for the throne. After obtaining a promise from his barons to support Matilda, Henry married her to Geoffrey of Anjou. This marriage was not popular with the barons, and Matilda herself did not command their loyalty. After Henry's death in 1135 the throne was seized by his nephew Stephen of Blois. After years of civil war Matilda renounced her own claim, and Stephen agreed to recognize her eldest son, Henry, as his heir.

Henry Is reign occurred during the European investiture controversy, in which the reform papacy struggled with secular powers for control of the bishoprics. In England this crisis came to a head when Archbishop Anselm refused to do homage to Henry for his fiefs and to consecrate bishops whom Henry had already invested with the ring and staff, the symbols of episcopal office. When the pope refused to condone the English customs concerning lay investiture of clerics, Anselm returned to the Continent. A compromise, giving

the church the right to invest the ring and staff but permitting the king to take oaths of homage from the prelates, was effected • in 1106.

In addition to unprecedented peace and prosperity Henry I's reign also saw the development of important institutions of government. One of his accomplishments was the reform of the *curia regis* (king's court). He organized royal offices and instituted regular payments to his officials. This eliminated the need to plunder the countryside as they moved about with the itinerant king. Henry also systematized the treasury, and his reign saw the development of the exchequer's twice-yearly meetings for collecting the taxes due the king. These sessions were recorded onto the "pipe rolls." One pipe roll (from 1130) survives for Henry's reign, and its completeness and sophistication argue that it is one of a series of such documents. It is a rich source, showing among other things that many legal reforms once credited to Henry II were operative by the reign of his grandfather.

Although some historians have characterized Henry's rule over England and Normandy as harsh, others have shown that contemporaries considered the reign to be successful; it provided England with 33 years of peace and prosperity. Even in Normandy, which traditionally suffered from a fractious barony, Henry's peace was seriously broken only twice after 1106. His accomplishments in war and diplomacy, law, and administration combine to show him as one of England's most able and effective rulers.

Henry II (1133–1189; r. 1154–89)

The eldest son of Count Geoffrey of Anjou and Matilda of England (heiress of Henry I), born 5 March 1133. He became duke of Normandy in 1150 and count of Anjou in 1151. In May 1152 he married Eleanor, duchess of Aquitaine and disowned wife of Louis VII of France. On the death of Stephen he became king of England, at age 21, and was crowned on 19 December 1154. His children included Henry (d. 1183), Matilda, Richard the Lionheart, Geoffrey, duke of Brittany, Eleanor, Joan, and John, as well as the illegitimate Geoffrey archbishop of York and William Longsword, earl of Salisbury. He died on 6 July 1189.

Tireless, well educated, and dismissive of conventional wisdom, Henry was also a man of seemingly contradictory qualities: willful but calculating, obstinate but open-minded, volatile but purposeful, both magnanimous and vindictive, jealous of his rights but indifferent to pomp and personal dignity. He was an enigma to contemporaries and has elicited varying judgments from historians. Few students have denied that he exercised a major influence on the course of western European history.

The wide dominions under his direct rule, covering more than half of France as well as England, may have seemed largely ungovernable, but Henry's achievement was to oblige all over whom he claimed jurisdiction to respect his authority and to overcome resistance swiftly and decisively. It was achieved largely by a daring use of mercenary forces skilled in siege techniques, thus devaluing the castle as the traditional base of defense. His dominance aroused not only the resentment of the greater barons but also the apprehensions of his neighbors.

The most publicized but by no means the only example of Henry challenging special interest groups was his conflict with the church. Though not opposed in principle to the church extending and refining its jurisdiction, Henry insisted that it should neither encroach on the crown's jurisdiction nor threaten crown interests. His tactic for ensuring smooth relations by installing an ally, his chancellor and friend Thomas Becket, as archbishop of Canterbury, backfired when Becket, showing a dedication to the church's power and independence that surprised many who had been lukewarm about his nomination, vigorously defended his own authority.

Henry tried to settle the issue by fiat, by issuing his Constitutions of Clarendon (1166), based largely but selectively on customary practice. His demand for an unprecedented oath of observance from the bishops united them in resistance. It did not, however, unite them in support of Becket; some believed him to be mistakenly provocative and tactically inept. Henry's not

unreasonable stance was undermined by his vindictive harrying of the archbishop, and it culminated, after a purported reconciliation, in intemperate words that prompted some members of the royal household to murder Becket in December 1170. Henry was obliged to retreat publicly. Eventually he salvaged much of what he had originally sought, though in a less provocative form. There are parallels to this in other aspects of his career.

All who resented his dominance sought to profit from the setback to his reputation in the wake of Becket's martyrdom. In 1173–74 Louis VII of France organized a coalition of Henry's opponents, both internal and external, in a determined attempt to unseat him by insurrection and invasion. Henry, sustained by the loyalty of his servants and by popular support, survived triumphantly. He exacted no revenge, save upon his headstrong wife, who remained in close confinement for the rest of his life, for having conspired with her former husband Louis to replace Henry with their malleable eldest son, the young king Henry. His victory persuaded most barons that their future lay in cooperating with the king to secure his patronage instead of striving for autonomy.

Whether Henry intended the formation of an "Angevin Empire" is debatable. His initial aggressiveness suggested expansionist aims, but there are clear signs that he came to detest the wasteful futility of warfare and limited his objectives to internal order. His intervention in Ireland (1171) seems to have been a reluctant response to the need to control Anglo-Norman adventurers. He was content to secure amicable relations with the Irish, as with the Welsh and the Scots. He intended to partition his dominions among his sons; it was his successors who sought to consolidate a unitary control that collapsed before a resurgent French monarchy. Henry's rule had, however, demonstrated how to make authority respected and how to harness it to effective government.

In the kingdom of England there was, in Henry's reign, a transformation in the processes of government and in the methods of administering justice. It rested essentially on three linked developments. First, the decision to rest responsibility for bringing criminal prosecutions not on official prosecutors but on local communities through "juries of presentment" (the origins of the grand jury). Second, the supervision of the operations of local government by investigative teams of justices, who carried royal government into the shires, empowered but also limited by the terms of a carefully framed commission. Third, the offer of the new and much swifter methods of righting civil wrongs by means of common-form writs that set in motion standardized procedures and rested decisions on questions of fact put to juries under the supervision of royal justices who could put the power of the crown behind enforcement.

The flood of business that ensued prompted the development of central

courts of justice and a quest for more rational and sophisticated methods in all aspects of administration. In essence Henry and his advisers had found a solution to the age-old problem of how to deploy royal authority effectively without putting too much discretionary power into the hands of subordinates. A less welcome consequence was the enhanced power of the crown to discriminate against individuals who were out of favor. A necessary corrective to overweening royal government was eventually to be found in Magna Carta, but it is significant that there was no attempt in the Great Charter to reverse the trends that Henry II had fostered, that the closer integration of central and local government was accepted and the development of the common law welcomed.

Henry III (1207–1272; r. 1216–72)

Born 1 October 1207, the eldest son of King John by his second wife, Isabella of Angoulême. His accession (28 October 1216) inaugurated the first royal minority in England since the Conquest.

Few English kings have begun their reign under less auspicious circumstances: much of the country was in the hands of rebels who supported the claim of Louis, son of Philip II of France. The strenuous aid of the papal legate Guala, to whom Henry did homage as the pope's representative, for his kingdom, helped save the situation and ensure that the king remained ever

conscious of his debt to the papacy.

For its part the regency council, headed by William Marshal, earl of Pembroke (d. 1219), reissued Magna Carta and settled the civil war by expelling the invaders and granting an amnesty, including restoration of all confiscated lands. In the 1220s the leading role was played by the able and ambitious Hubert de Burgh, who had been made justiciar by John. With his dismissal in 1232 a new group of administrators gathered around Henry, headed by Peter des Roches and his nephew Peter des Rivaux.

Henry came of age in stages between 1223 and 1227, but he did not finally emerge from the control of ministers inherited from his father until 1234. Although mercurial and sharp-tongued, he was an amiable, accessible, and devout man who took the cross on three occasions (1216, 1250, and 1271), though he never actually went on crusade. He was a notable patron of the arts who lavishly embellished his royal residences and rebuilt and enlarged Westminster Abbey, destined as the burialplace of himself and many of his successors, in honor of his patron saint, Edward the Confessor. He married Eleanor of Provence in 1236; their children included Edward (later Edward I), Margaret, Beatrice, and Edmund "Crouchback," earl of Lancaster.

Although he tried, by a series of marriages, to associate the barons with his family and court, and claimed that the maintenance of internal peace was his greatest achievement, his relations with the barons were never free from suspicion and hostility.

The humiliating failure of his campaign in France in 1242, in pursuit of his ambition to regain the territories lost by his father, demonstrated his military ineptitude. He was too indulgent to his closest supporters, notably the Savoyard relatives of Eleanor of Provence, whom he married on 20 January 1236; the impecunious Simon de Montfort, who married his sister in 1238; and his Lusignan half-brothers, the children of his mother's second marriage. The Lusignans, who came to England in 1247, presumed on their relationship to abuse royal authority and behave as though they were above the law. His unrealistic ambitions for his family, which led him in 1254 to accept the papal offer of the kingdom of Sicily for his second son, Edmund, plunged him deeply into debt.

In the various crises of Henry's middle years the magnates rejected his lofty notions of kingship and demanded that they be consulted on questions of policy and the appointment of great officers of state. In 1258 their leading members, including his brother-in-law Simon de Montfort, expelled the Lusignans and, in an unprecedented restriction on the crown's rights and powers, imposed a baronial council on Henry in the Provisions of Oxford. Acting in his name, they reorganized local government, widely regarded as oppressive and corrupt, reformed the law (the Provisions of Westminster), and

settled outstanding differences with France by the Treaty of Paris in 1259, by which the king surrendered his claim to most of the French territories.
